CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 521. SATURDAY, JANUARY 22, 1842. PRICE 1½d.

COMICALITIES OF NATURE.

THERE are some objects in animated creation which irresistibly provoke a smile. It is different with inanimate nature, which is variously beautiful, sublime, tame, desolate, wild, or whatever else, but always respectable. There is nothing frisky in the characters of mountains or precipices, plains, lakes, rivers, or seas—unless, indeed, we are to make an exception for some little *burns* in our own northern land, which the imagination may very readily suppose to be of a tricksy, gambolsome humour, seeing with what deft antics they tumble and trip along their pebbly way, as if to amuse the gowans that ogle them as they pass, from the fairy-befooted sward. But, upon the whole, inorganic creation is not at all funny. Animated nature, on the contrary, presents to us an immense deal that we cannot help feeling to be so.

To begin with the next creatures below ourselves—there are the monkeys, whose whole appearance and movements are grotesque. Who could ever look in the face of one of these animals without that same stirring of the risible faculties which we experience in perusing a caricature or parody, or witnessing a pantomime? The wretch never laughs itself, but its every gesture is provocative of mirth in us. See it taking care of one of its young, or allaying some temporary irritability in one of its sides, or inspecting any suspicious-looking morsel which may have been given to it, and the perfect whimsicality of the creature must be acknowledged. So thoroughly is this the case, that no one could ever speak of a monkey gravely: the name is never mentioned without a smile or a laugh. The appearance of the sloth is ludicrous, but in a different way. "There," remarks Cuvier, "nature seems to have amused herself with producing something imperfect and grotesque." The mirth excited by this animal is of the derisive kind. We smile to see a miserable-looking creature crawling so abjectly, unable to use its fore-legs for support, and only able to move when it can get something to lay hold of, whereby to pull itself along. The sloth may be, as later naturalists allege, fully accomplished for all the ends of its being; yet it is not less true that, constituted as we are, we cannot help smiling at an object which strikes our minds as so uncouth.

So, also, the peculiar feature of the marsupial tribes is no doubt appropriate to the circumstances in which they live. Yet is it in the power of any human being to think of that feature with the same feelings as those with which, for instance, he would regard the gracile limb of the antelope, or the shaggy mane of the lion? To think of a creature having a pouch in which to carry her young family, and from which they may occasionally be seen peeping like so many juvenile bipeds from a huckster's panniers, is surely a most whimsical idea. Think of what a monstrous crime pocket-picking must appear to a female kangaroo with a charge of children. Australia presents another good living joke in her celebrated ornithorhyncus, where we see a creature like a rat, but a good deal larger, furnished with a duck's bill and web-feet—an association exactly of the same character with those which human conceit has occasionally formed for emblematical devices, or in the way of buffoonery.

Amongst the feathered tribes there are also numerous traces of comicality. The choler of the turkey-cock never fails to excite mirth. Domesticated ravens come to enter into the humours of the families they live with, and sometimes prove amazingly funny. The whole race of parrots is amusing. Not altogether mechanical is that power they have of repeating droll expressions, under the instruction of human masters and mistresses. By timing their jokes, they often show that they enjoy them. This tribe, as well as the monkeys and mocking-birds, are unquestionably possessed of that same power of imitation which men employ to the excitement of mirth in mimicry and comic theatricals. The mocking-bird is the very Monsieur Alexandre of American ornithology. It can simulate the cry of almost all birds, and the name we give it expresses the purposes for which it employs the gift. One of its favourite waggeries, as is well known, is to gather other birds near it by imitating their cries, and then to disperse them, like a set of schoolboys at the approach of the master, by uttering the cry of the bird of which they stand most in fear.

There are many whimsical things in the vegetable world, though the British Flora is perhaps a more serious goddess than some of her foreign sisters. If we go abroad, we shall find many quaint things in this department of nature. The *broussonetia papyrifera* of Japan and India, from which the article called India paper is made, has leaves all different in form, and each of which seems as if it had had a piece rent out of it, and as if it had been afterwards sewed up again to repair the damage. Here there is as complete an appearance of a familiar human action being imitated in nature, as there is in the junction of the duck's bill to the water-rat's body in the ornithorhyncus. There is exactly that disarrangement of the fibres of the leaf, and that appearance of puckering at the seam, which would be seen in a piece of checkered cloth, worn by a mendicant, which, having had a narrow section taken out of it, had been hastily *based* together without any regard to the joining of the chequers or to smoothness of surface. The well-known fly-trap strikes the mind with all the effect of a joke. The leaf stands temptingly open; a poor fly pops in for shelter or food; no sooner has it set its foot on the bottom, than some sensitive fibres are affected, and the cilia at the top close in upon the intruder, empounding him as effectually as if a boy had taken him and closed him up in a box. The doings of a human economy are also curiously coincident with those of the pitcher-plant of the east. To the footstalk of each leaf of this plant, near the base, is attached a kind of bag, shaped like a *pitcher*, of the same consistence and colour as the leaf in the early state of its growth, but changing with age to a reddish purple. It is girt round with an oblique band or *hoop*, and covered with a *lid* neatly fitted, and moveable on a kind of *hinge* or strong fibre, which, passing over the *handle*, connects the vessel with the leaf. By the shrinking or contracting of this fibre, the lid is drawn open whenever the weather is showery, or dews fall, which would appear to be just the contrary of what usually happens in nature, though the contraction is probably occasioned by the hot and dry atmosphere, and the expansion does not take place till the moisture has fallen and saturated the pitcher. When this is the case, the cover falls down, and it closes so firmly as to prevent any evaporation taking place. The water having gradually absorbed through the handle in the footstalk of the leaf, gives vigour to the leaf itself, and sustenance to the plant. As soon as the pitchers are exhausted, the lids again open, to admit whatever moisture may fall; and when the plant has produced its seed, and the dry season fairly sets in, it withers with all the covers of the pitchers standing open.*

There are some plants, the flowers of which bear curious, if not ludicrous, resemblances to other objects. The natural order *Orchidaceæ* are remarkable for this property. The flower of the *Oncidium papilio* presents an extraordinary resemblance to a tortoise-shell butterfly, as that of the *Phalænopsis amabilis* does to a white one. *Peristeria pendula* looks like a dove crouching in its nest, and *Coryanthes micrantha* resembles a skeleton's head, with the vertebræ of the neck, finished off with a pair of bat's wings!* The flower of the *bee orchis* is like a piece of honeycomb, and, strange to say, the bees delight in it. Then there is the *snap-dragon*, the corolla of which is cleft and turned back so as to look like a rabbit's mouth, especially if pinched on the sides, when the animal appears as if nibbling. If, in like manner, the two petals or nectaries of another well-known plant are pinched, they peep from under the coloured calyx, like two great eyes looking out under the cowl of a monk—hence its name of monk's-hood. The flower of the cock's-comb and seed-pod of the *Mostynia proboscidea* bear equally curious resemblances to the objects which have suggested their names. Some kinds of *Medicago* have also curious seed-pods, some being like bee-hives, some like caterpillars, and some like hedgehogs—the last being itself an essentially ludicrous natural object.

A certain grotesqueness of form belongs to the whole order of *Cactaceæ*. The *Cactus senilis* would arrest the most unobservant eye in an exhibition of plants, by the ludicrous peculiarity from which it derives its name. Being simply a kind of stump, covered with long white streaming hair, it exactly resembles the head of an old man! In its native country, this cactus puts on considerably different, but not less ludicrous, appearances. It there grows to the height of ten or twelve, sometimes even to twenty or thirty, feet, and when it approaches a flowering state, a circlet of short brown fur appears round the summit, which gradually increases till it takes the very form and appearance of a lady's fur muff! Mr Lambert, the President of the Linnæan Society, has preserved in glass-cases, in his drawing-room, two specimens taken from full plants; and a person who has seen them reports to us, that one in particular, about eighteen inches high, precisely looks like an old sable muff. The flowers of the cactus senilis are crimson, and are produced in a ring. The reader may therefore judge what a curious figure our old gentleman plant cuts in his native woods, with his body all covered with long white hair, surmounted by a black muff, and above all a wreath of crimson flowers.

Our minds naturally recognise the tall straight stems of the beech and elm as elegant objects. The trunk of the oak is thick, but it conveys the idea of manly robustness and vigour. Most flowering plants in this country have elegant stalks, to which the flower parts are in general neatly and fittingly joined. We never think of smiling mirthfully at any of these objects, but, on the contrary, are disposed to regard them with a musing and serious admiration. How different are these cactuses, with their incomprehensible lumpy angular stems, masses of green vegetable matter, decorated quaintly along the edges with prickles, while here and there a flower sticks out, looking as oddly placed as would a man's head if it projected from his side or stuck upon his knee. It is the *Cactus speciosissimus* which is so particularly liable to this description. To the dark crimson flowers which ornament its stem, succeeds the fruit, a thing which one would at first suppose to be an egg, till tasting it he would imagine it a gooseberry! In their native

* This description of the pitcher-plant is from Barrow's Cochin China.

* There is a figure of this flower in the *Botanical Register*, vol. xxii., but it gives no idea of the horrible grotesque of the living plant.

country, they rise thirty or forty feet high, without a single branch or a single leaf, and it is generally upon the tops of mountains that they grow. Pæping, a German botanical traveller in Brazil, says that, in that country, a hill top bristling with the *cactus speciosissimus*, resembles nothing so much as a hog's back!

Then we have the creeping cereus (*cereus flagelliformis*), which looks like a number of cats' tails tied together, and hung over a flower-pot, with a few crimson flowers stuck into them irregularly. The spines with which these hanging stems are completely covered are what give them the cats' tail appearance: they have no leaves, but the tails are sometimes forked. The leaf cactus (*Epiphyllum phyllanthoides*) is of totally different but equally quaint form, the stems appearing to consist of a series of leaves stuck into each other, and having notches in the sides from which spring the flowers. The porcupine cactus (*echinocactus*) has a round ball-like stem, often with projecting angles like a lady's reticule, covered with hard sharp spines. The flowers of this genus appear thrown carelessly on the stem, and not to belong to it. We might expatiate upon the eccentricities of this order of plants for half a day, but shall content ourselves with adverting to that crowning conceit manifested by one of the family, of blowing in the middle of the night—emblem apt and true of a certain class of whimsical mortals.

Every one has heard of *lusus naturæ*—sports of nature—things which she was supposed to produce in the way of freak, and as exceptions from her ordinary laws. Fossil shells, for example, were considered as *lusus naturæ*, no one being able to understand how, if they had been originally real shells of marine molluscs, they could ever have got into those deep-seated rocks where they were found embedded. It is now believed that there are no such things as *lusus naturæ*, every one of her organic creations being formed after a distinct type, and designed for a particular purpose in creation, just as there is no character used in a printed book but what there is a type for in the compositor's case, and is liable to appear accordingly in other printed books of the same language. The true sports of nature are to be seen in the many grotesque forms of her legitimate and recognised children, animals and plants, and in the whimsical powers and properties which she has assigned to many of at least the former class. With regard to grotesque forms in plants and animals, it may be said that these things are perhaps not absolutely grotesque, and that it is only in consequence of some law of our minds that we think them so. This, we conceive, may be the case without in the least detracting from the force of what has been said; for how can we judge of any thing but by virtue of and in accordance with the habits of our minds? Undoubtedly, if the cheek of the fair young maiden affects us with the sense of beauty, as truly does the figure of the Barbary ape affect us with the sense of comicality. So, also, of the powers and properties of many animals. The chatter of the parrot, the strut and crow of the cock, the wretched bray of the ass, the capers of the young goat, and the pranks of the kitten, all affect us with the same risibility as the humour of a Mathews or the wit of a Sheridan. To come finally to man, he has been endowed with both the power of creating mirth and the power of enjoying it. He has a faculty of the ludicrous in his mental organisation, and muscles in the face whereby to express the sensation in its well-known form of laughter. Some are born with such a predominance of the ludicrous in their nature, and such wonderful powers of awakening risibility in their fellow-creatures, as to seem to have been mainly designed, as far as the worldly utility of their existence is concerned, for this purpose. This is a class of men particularly apt at perceiving the comicalities of the lower animal and vegetable worlds. While others see only what is painful and melancholy in the scene around them, they are conscious only of what is merry and ridiculous, and spend the part of their lives that is devoted to common sensation in a constant flow of self-generated humour.

We would fain, from all that has been said, establish the importance of the comical in the mundane economy. It seems to us that it cannot be necessarily a reprehensible frivolity—to however absurd purposes it may be occasionally perverted—when we see traces of it springing directly from the common Origin of all things. Time and place may be necessary for its proper development amongst assembled human beings, but this is no more than what may be said of all things. There is a time to laugh and a time to weep. Man, it is true, in his blind zeal for what his higher sentiments dictate, has sometimes acted as if to smile were a sin. He has, strange to say, thought that an invariable gloom and sadness was the proper habit of mind in which to live, as being more agreeable to the Deity. But when we look into the book of nature, we see these ideas completely contradicted. We there find types of being which must have been grotesque and whimsical in their forms, since long before there was such a thing as the human mind to regard them either in one light or another. We see jocularities and merriments in animals which existed long before man, and to which no moral error can be imputed. Finally, we see man himself organised so thoroughly for mirth, that his very health is liable to be improved by it.* Well, indeed, might Grecian imagination include Thalia amongst the children of Jove.

POPULAR INFORMATION ON FRENCH LITERATURE.

ELEVENTH ARTICLE.—SULLY.

HAVING described the early warlike portion of Sully's career, we now take him up as a grave and calculating minister of state. The section of his Memoirs devoted to this part of his history presents a picture of political sagacity remarkable for that age, leaving us scarcely room to wonder that his royal master, though his senior, was often checked, when about to do a foolish thing, by the consideration, "What will Sully say to all this?" He commenced his career as a minister in 1594, in the capacity of secretary of state. Four years after, he was appointed superintendant of finances, having displayed as much ability in that department as he had previously shown military fire and skill in the time of war. Many important negotiations were conducted by him. One is very remarkable, as showing the liberties which Sully took with the king, and the state of feeling existing between the two. The king, his master, had given a rash and unworthy promise of marriage in one of his fits of passion. Sully was in confidence consulted by Henry. On reading the document, he slowly and gravely tore it in pieces. "Are you mad?" cried the infuriated monarch. "Yes," answered Sully, "I am mad, sire, and I wish I were the only madman in France!" Sully's firmness had the result of making Henry enter into a marriage with the person whose alliance in those times was best suited to the exigencies of the state. As regards mutual liking and individual feelings, these are seldom held of consequence in such affairs.

The many important negotiations in which Sully was engaged at home, exclusively of mere financial affairs, had reference chiefly to the maintenance of the Protestant interests, and to the suppression of the petty feudal sovereigns yet existing in France, and possessing sufficient power to brave and embarrass their liege lord. It was through the able management of matters in Henry's days, that this anomalous and perilous state of things was brought to an end, and the real authority lodged in the hands of a single monarch. Besides aiding his master powerfully in such domestic concerns, Sully was employed in many foreign missions and negotiations. As ambassador from Henry, he had a confidential interview with Queen Elizabeth at Dover in 1601; and two years afterwards, he went to London on a mission to her successor, James I. Of the account given of the latter visit, we shall present some incidental snatches.

Sully, whose instructions chiefly related to the conjunction of France and England against the Spanish interests, found at Calais the vice-admirals of France, Holland, and England, all of them anxious for the honour of conveying him across the channel. By way of a compliment, he accepted the seemingly courteous offer of the English, and his going on board led to results which prove that the English sailors of that day were just the English sailors of the present. The French admiral, "De Vic, who only sought an opportunity of showing the English his resentment of the violences committed by their pirates, advancing, bearing the French flag on his maintop-gallant mast, I found these complaisant English were enraged at an offence which, according to them, was equally injurious to the King of England, and the King of France, whom I represented; and I had reason to think them still more rude and impolite, when, without deigning to consult me, *fifty shot* were immediately fired into De Vic's ship." Sully thought it wise to explain that the flag was raised in honour of Henry's ambassador; and he also deemed it prudent to make a signal for its being lowered, which was done just in time, as appears from another broadside having been prepared by the English, which they fired at "random." Sully and his extensive suite, notwithstanding this untoward opening incident, were received with great honours at Dover, whence they went by land to Gravesend, and, entering a rich royal barge, sailed up the Thames. The Tower gave him a salute of three thousand guns, the finest thing of the kind (he says) that he had ever heard. He had scarcely reached London, and taken up a temporary residence in a house there, when another untoward business occurred, of which he gives an account.

His people went out to houses of entertainment, and "at the same place they met with some English, with whom they quarrelled, fought, and one of the English was killed. The populace, who were before prejudiced against us, being excited by the family of the deceased, who was a substantial citizen, assembled, and began loudly to threaten revenge upon all the French, even in their lodgings. The affair soon began to appear of great consequence, for the number of people assembled upon the occasion was presently increased to upwards of three thousand, which obliged the French to fly for an asylum into the house of the ambassador. I at last imagined something extraordinary had happened, and having questioned Terrail and Gadancourt, they informed me of the particulars.

The honour of my nation, my own in particular, and the interest of my negotiation, were the first objects that presented themselves to my mind. I was also most sensibly grieved that my entry into London should be marked at the beginning by so fatal an accident; and at that moment, I am persuaded, my countenance plainly expressed the sentiments with which I was agitated. Guided by my first impulse, I arose, took a flambeau, and ordering all that were in the house (amounting to about a hundred) to range themselves round the walls, hoped by this means to discover the murderer, which I did without any difficulty by his agitation and fear. He was for denying it at first, but I soon obliged him to confess the truth. He was a young man, and the son of the Sieur de Combaut, principal examiner in Chancery, very rich, and a kinsman likewise of Beaumont, who entering at that moment, desired me to give young Combaut into his hands, that he might endeavour to save him. 'I do not wonder,' replied I to Beaumont, with an air of authority and indignation, 'that the English and you are at variance, if you are capable of preferring the interest of yourself and your relations to that of the king and the public; but the service of the king my master, and the safety of so many gentlemen of good families, shall not suffer for such an imprudent stripling as this.' I told Beaumont, in plain terms, that Combaut should be beheaded in a few minutes. 'How, sir,' cried Beaumont, 'behead a kinsman of mine, possessed of two hundred thousand crowns, an only son!—it is but an ill recompense for the trouble he has given himself, and the expense he has been at to accompany you.' I again replied, in as positive a tone, 'I had no occasion for such company;' and, to be short, I desired Beaumont to quit my apartment, for I thought it would be improper to have him present in the council, which I intended to hold immediately, in order to pronounce sentence of death upon Combaut.

In this council I made choice only of the oldest and the wisest of my retinue; and the affair being presently determined, I sent Arnaud to inform the mayor of London of it, and to desire him to have his officers ready the next day, to conduct the culprit to the place of execution, and to have the executioner there ready to receive him."

The mayor, however, to whose justice Sully finally delivered the culprit, let him escape at the instance of the relative, and, satisfied with Sully, the people seem to have done nothing further in the matter. Justice, it would seem, had not then come to the state in which Oliver Cromwell placed it, when Don Pontoleon Sa, the very brother of the Portuguese ambassador, was sent to the scaffold by the stern Protector, in spite of all entreaties, individual and national. Sully is induced by what passed on this occasion to give the following picture of our nation—not a very flattering one, but tinged to some extent with truth. "It is certain that the English hate us, and this hatred is so general and inveterate, that one would almost be tempted to number it among their natural dispositions: it is undoubtedly an effect of their arrogance and pride, for no nation in Europe is more haughty and insolent, nor more conceited of its superior excellence. Were they to be believed, understanding and common sense are to be found only among them: they are obstinately wedded to all their own opinions, and despise those of every other nation; and to hear others, or suspect themselves, is what never enters into their thoughts. Their self-love renders them slaves to all their capricious humours. What they at one time believe to have wisely performed, or firmly resolved, is at another time destroyed without their knowing, or being able to give a reason: they are accordingly so undetermined in themselves, that frequently one would not take them for the same persons, and from hence they themselves sometimes appear surprised on perceiving their own continued irresolution. If we examine what are called their maxims of state, we shall discover in them only the laws of pride itself, adopted by arrogance or indolence." Admitting the correctness of the charge of national vanity, we must observe that Sully's national prejudice has prevented him from seeing that it is probably in a great measure to this belief in our superiority that we owe our actual greatness in arms and arts.

Sully's account of accidental particulars connected with his embassy, is much more interesting than his description of his interviews with James I., of whose personal demeanour he says little. Their first meeting, however, must have been striking. Sully, attended by one hundred and twenty selected gentlemen of his large suite, and a party of the royal guards, went to see the king at Greenwich. "His majesty having sent to desire my appearance in his presence, I was above a quarter of an hour before I could get to the foot of his throne, occasioned both by the great numbers that were already there, and because I made all my retinue walk before me. The prince no sooner perceived me than he descended two steps, and would have descended them all, so very desirous he appeared to receive and embrace me, had not one of his ministers, who stood next him, whispered softly in his ear that he ought to go no farther. 'If,' said he aloud, 'I

* Dr Hufeland of Berlin has expressed his opinion that light merriment is good for digestion.

show this ambassador particular marks of honour, and such as are contrary to custom, I mean not thereby to give a precedent to others. I particularly love and esteem him for the affection which I know he has for me, for his firmness in our religion, and his fidelity to his master.' I dare not repeat all that he said to my advantage." At this and other meetings, Sully showed great tact, and was successful in getting James to form a treaty with Henry of the kind desired. On the whole, the ambassador formed rather a low estimate of James, of whom he pronounced on this occasion that he was the most learned fool in Christendom.

To describe his services and connexion with Henry his master, is, as mentioned before, to tell at once Sully's history, and to show his literary abilities. The slavery in which the king was held by his passions, was a great source of vexation to Sully, both on account of his personal love for him, and of the expenses attending such a course of life. One day, when the minister was resisting some improper application, the temporary favourite, D'Entragues, said impudently and haughtily to him, "To whom would you have the king grant favours, if not to his relations, courtiers, and favourites?" "Madam," replied Sully, "you would be in the right if his majesty took the money out of his own purse; but is it reasonable that he should take it out of those of his poor subjects, to gratify such people as you speak of?" Holding such sentiments, it may be conceived that Sully's administration was a continued blessing to his country. He was easy of access, and methodical in all his habits. Though sometimes galled into anger by his remonstrances, Henry raised him to the highest honours of the peerage, and, with his other posts, gave him the governorship of Poitou. Henry's death in 1610 terminated Sully's official career, and he received at its close a gratuity of 100,000 crowns. Occasionally, after this period, he was sent for to the councils of Louis XIII., and at these times he appeared in the antiquated garb of the old court. Some silly young courtiers laughing once at his appearance, "Sire," said the venerable minister to the king, "when your father, of glorious memory, honoured me by a call to his state consultations, he previously sent away the buffoons." The king felt the rebuke, and remained alone with Sully.

Sully died in 1641, at the age of eighty-two. His "Memoirs" and his memory have ever been highly esteemed in France.

SLAVE HUNTS IN EGYPT.

THE recent publication of a work entitled "Egypt and Mohammed Ali,"* by Dr R. R. Madden, has brought prominently into notice a variety of circumstances connected with the legalised system of slavery in Egypt, as well as the manner in which it is supported by the practice of hunting down and carrying off the unfortunate inhabitants of Nubia and Abyssinia. As little is popularly known on the subject, we propose, with the assistance of facts gleaned from the work of this intrepid and philanthropic writer, to bring it before our readers.

In all the undertakings of Mohammed Ali, with the ostensible view of civilising the nation of which he is the ruler, he appears to be animated by one prevailing sentiment, and that is, the desire to serve his own selfish purposes, and yet deceive the people of Europe, who, he is fully aware, have an eye to his public actions. In accomplishing this object, he has, by the aid of French tacticians, been eminently successful. The trick of his highness is generally well managed; it consists in issuing orders of the most liberal nature respecting any matter of serious complaint, for which he receives a great deal of praise, but which orders, except in particular instances, he takes good care shall never be carried into execution. Two or three years ago, when on an expedition into Eastern Africa, he found it his interest to be very much shocked with the practice of capturing slaves for sale within his dominions, and issued an immediate order that this barbarous trade should be prohibited. So pleasing a circumstance gave much satisfaction in England, and the Anti-Slavery Convention held in London sent an address applauding his generous and humane conduct. Dr Madden was the bearer of this document to his highness; but, greatly to his surprise, he found, on its presentation (August 1840), that the pacha had taken no step whatever to give effect to those orders for which he was now congratulated. The slave hunts and slave sales went on the same as ever.

Our author was much shocked to find the Egyptian despot so much less a man of humanity than English philanthropy had supposed, and he took leave to present to him a very bold address, in which he stated that there were three hundred slaves for sale at that moment in the markets of Cairo and Alexandria; that the number sold in the preceding twelve months was above ten thousand; and that the government not only permitted, but practised, the horrible traffic, the pacha's soldiers being regularly employed in seizing slaves in Nubia, and a tax upon their exportation being one of the resources of his treasury. Mohammed Ali equivocated, and threw the blame upon the law and the sultan; but his issuing licenses to slave-merchants is in itself sufficient to establish his guilt. The particulars which Dr Madden gives of the mutilation of children for certain purposes makes the flesh thrill with horror; and his description of slave-hunting in Nubia presents a picture of oppression which must stamp this plausible tyrant with everlasting infamy.

The number of persons carried off from the Nubian mountains between 1825 and 1839, omitting the thousands who were captured by the Bakkara, amounted to at least 100,000. As soon as the rainy season is over, the capturing excursion, called Gasna, commences, and the necessary number of camels, one for each soldier, and others for arms, ammunition, and tents, is demanded. The soldiers seize all that comes in their way, and in a few days all that is necessary is obtained. The capturing expedition consists of from 1000 to 2000 regular foot soldiers; 400 to 800 Mograbini (Bedouins on horseback) armed with guns and pistols; 300 to 500 of the militia (half-naked savages) on dromedaries, with shields and spears; and 1000 more on foot, with bucklers and small lances. "As soon as every thing is ready, the march begins. They usually take from two to four field-pieces, and only sufficient bread for the first eight days. Oxen, sheep, and other cattle, are generally taken by force before at Cordofan, although the tax upon cattle may have been paid. When they meet with a flock, either feeding or at the watering-places, they steal the cattle, and do not care whether it belongs to one or more persons; they make no reparation for necessary things, whoever may be the sufferer, and no objection or complaint is listened to, as the governor himself is present.

As soon as they arrive at the first mountains in Nubia, the inhabitants are asked to give the appointed number of slaves as their customary tribute. This is usually done with readiness; for these people live so near Cordofan, and are well aware that, by an obstinate refusal, they expose themselves to far greater sufferings. If the slaves are given without resistance, the inhabitants of that mountain are preserved from the horrors of an open attack; but as the food of the soldiers begins to fail about that time, the poor people are obliged to procure the necessary provisions as well as the specified number of slaves, and the Turks do not consider whether the harvest has been good or bad. All that is not freely given, the soldiers take by force. Like so many bloodhounds, they know how to discover the hidden stores, and frequently leave these unfortunate people scarcely a loaf for the next day. They then proceed on to the more distant mountains: here they consider themselves to be in the land of an enemy; they encamp near the mountain which they intend to take by storm the following day, or immediately, if it is practicable. But before the attack commences, they endeavour to settle the affair amicably; a messenger is sent to the sheik, in order to invite him to come to the camp, and to bring with him the requisite number of slaves. If the chief agrees with his subjects to the proposal, in order to prevent all further bloodshed, or if he finds his means inadequate to attempt resistance, he readily gives the appointed number of slaves. The sheik then proceeds to procure the number he has promised; and this is not difficult, for many volunteers offer themselves for their brethren, and are ready to subject themselves to all the horrors of slavery, in order to free those they love.

Here the most heart-rending scenes may be witnessed: for who is willing to separate himself from his home, from his parents, brothers and sisters, and relations?—who likes to forsake the cottage that has sheltered him from his infancy, and where he has spent so many happy hours in the society of those by whom he is beloved?—who likes to go forth to meet a horrible futurity, which promises nothing but misery, cruelty, and, what is perhaps most desirable, death?—and yet they feel the necessity that one of them should suffer in order to exempt the rest; the father may frequently be seen disputing with his son, the brother with his brother, as to which of them is to deliver himself freely into slavery, for every one wishes to save his affectionate and endeared relative.

The anticipation of falling into the hands of the unfeeling Turks, where nothing but misery and torments await them, to which they must submit—the prospect of being obliged to forsake all that is dear to them, and that for ever—overpowers them. They bedew the cheeks of those they love with their tears, while they press the last kiss, and take the last farewell; they then deliver themselves into the hands of their unfeeling, hardened tormentors. Sometimes they are obliged to be torn by force from the embraces of their friends and relations. The sheik generally receives a dress as a present for his ready services.

But there are very few mountains that submit to such a demand. Most villages which are advantageously situated, and lie near steep precipices or inaccessible heights, that can be ascended only with difficulty, defend themselves most valiantly, and fight for the rights of liberty with a courage, perseverance, and sacrifice, of which history furnishes us with few examples. Very few flee at the approach of their enemies, although they might take refuge in the high mountains with all their goods, especially as they receive timely information of the arrival of the soldiers; but they consider such flights cowardly and shameful, and prefer to die fighting for their liberty.

If the sheik does not yield to the demand, an attack is made upon the village. The cavalry and bearers of lances surround the whole mountain, and the infantry endeavour to climb the heights. Formerly, they fired with cannon upon the villages and those places where the negroes were assembled, but on account of the want of skill of the artillerymen, few shots, if any, took effect: the negroes became indifferent to this prelude, and were only stimulated to a more obstinate resistance. The thundering of the cannon at first caused more consternation than their effects, but the fears of the negroes ceased as soon as they became accustomed to it. Before the attack commences, all avenues to the village are blocked up with large stones or other impediments, the village is provided with water for several days, the cattle and other property taken up to the mountain; in short, nothing necessary for a proper defence is neglected. The men, armed only with lances, occupy every spot which may be defended, and even the women do not remain inactive; they either take part in the battle personally, or encourage their husbands by their cries and lamentations, and provide them with arms; in short, all are active, except the sick and aged. The points of their wooden lances are first dipped into a poison which is standing by them in an earthen vessel, and which is prepared from the juice of a certain plant. The poison is of a whitish colour, and looks like milk which has been standing; the nature of the plant, and the manner in which the poison is prepared, is still a secret, and generally known only to one family in the village, who will not on any account make it known to others.

As soon as the signal is given for the attack, the infantry sound the alarm, and an assault is made upon the mountain. Thousands of lances, large stones, and pieces of wood, are then thrown at the assailants; behind every large stone a negro is concealed, who either throws his poisoned lance at the enemy, or waits for the moment when his opponent approaches the spot of his concealment, when he pierces him with his lance. The soldiers, who are only able to climb up the steep heights with great difficulty, are obliged to sling their guns over their backs, in order to have the use of their hands when climbing, and, consequently, are often in the power of the negroes before they are able to discover them. But nothing deters these robbers. Animated with avarice and revenge, they mind no impediment, not even death itself. One after another treads upon the corpse of his comrade, and thinks only of robbery and murder, and the village is at last taken, in spite of the most desperate resistance. And then the revenge is horrible. Neither the aged nor sick people are spared, women, and even children in their mother's womb, fall a sacrifice to their fury; the huts are plundered, the little possession of the unfortunate inhabitants carried away or destroyed, and all that fall alive into the hands of the robbers, are led as slaves into the camp. When the negroes see that their resistance is no longer of any avail, they frequently prefer death to slavery; and if they are not prevented, you may see the father rip up first the stomach of his wife, then of his children, and then his own, that they may not fall alive into the hands of the enemy. Others endeavour to save themselves by creeping into holes, and remain there for several days without nourishment, where there is frequently only room sufficient to allow them to lie on their backs, and in that situation they sometimes remain for eight days. They have assured me, that if they can overcome the first three days, they may, with a little effort, continue full eight days without food. But even from these hiding-places, the unfeeling barbarians know how to draw them, or they make use of means to destroy them: provided with combustibles, such as pitch, brimstone, &c., the soldiers try to kindle a fire before the entrance of the holes, and by forcing the stinking smoke up the holes, the poor creatures are forced to creep out, and to surrender themselves to their enemies, or they are suffocated with the smoke.

After the Turks have done all in their power to capture the living, they lead these unfortunate people into the camp; they then plunder the huts and the cattle, and several hundred soldiers are engaged in searching the mountain in every direction, in order to steal the hidden harvest, that the rest of the negroes, who were fortunate enough to escape, and have hid themselves in inaccessible caves, should not find any thing on their return to nourish and continue their life.

As soon as they have obtained about 500 or 600 slaves, they are sent to Lobeid, with an escort of country people, and about fifty soldiers, under the command of an officer. In order to prevent escape, a sheba is hung round the necks of the adults. A sheba is a young tree, about eight feet long, and two inches thick, and which has a fork at the top; it is so tied to the neck of the poor creature, that the trunk of the tree hangs down in the front, and the fork closed behind the neck with a cross piece of timber, or tied together with strips cut out of a fresh skin; and in this situation the slave, in order to be able to walk at all, is obliged to take the tree into his hands, and to carry it before him. But none can endure this very long, and to render it easier, the one in advance takes the tree of the man behind him on his shoulder. It is impossible for them to get their head free, and it frequently happens that they have their necks wounded, which is followed by an inflammation, and sometimes even by death.

Boys, between ten and fifteen years of age, who cannot bear such a sheba, are tied together, two and two, with wooden clasps on their hands: this is done by placing the wood on the right arm of one, and on the left of another, above the wrist, and then lacing it tightly. Other boys are tied together, by two and two, with leather strings. Boys under the above-men-

* London: Hamilton and Adams. 1 vol. 1841.

tioned ages, as well as girls, women, and aged persons, are allowed to walk at liberty. Many a mother carries her sucking babe, of a few days old, in her arms; others have to carry on their backs, or in their arms, two or three of their children, as they are too young and feeble to walk by themselves. Old people, tottering with their staves, the sick and wounded, walk, surrounded by their daughters, wives, or relations, and are assisted and even carried occasionally by them. If one of these unfortunate persons remains behind the line but one step, he is immediately forced to proceed by blows from the butt-ends of the guns, or by stripes of the whip; and if they even then should not be able to move on, from ten to twelve of them are tied with their hands to a cord, one end of which is fastened to the pommel of a camel, and the dying thus dragged along. No pity is shown to those who sink down; they are not released, but dragged along with the rest, even if one should die before they arrive at the appointed halting-place. Before the caravan halts, no refreshment, either of food or drink, is given to the debilitated negroes; the unfeeling Turks have no compassion—even if a drop of water should be sufficient to refresh the feeble, it is not given to him, but he is left to perish."

Enough of this dreadful picture! Let us hope that European, or at least British public opinion, will in some way be brought to bear upon the smooth-tongued monster who is at the bottom of all these atrocities.

LETTERS FROM A LADY IN LONDON TO HER NIECE IN THE COUNTRY.

MADAME TUSSAUD'S EXHIBITION.

My dear Jane,—I arrived in London a few days ago, after a long and amusing tour with your uncle on the Continent; and having much to do in a very limited time, before coming home to Scotland, it was only yesterday that I could begin to look about me, or visit any of the interesting sights in this wonderfully large town. By the kindness of Mr ——, I was conducted to several public buildings in the early part of the day; but none of these afforded me so much pleasure as an exhibition to which I was taken in the evening—I mean the very curious wax-work at the Bazaar in Baker Street, the proprietor of which is Madame Tussaud.

Madame Tussaud, you must understand, is an elderly French lady, who, in the early part of her life, figured in the higher circles of Paris at the time of the Revolution. She was the niece and adopted daughter of M. Curtius, a Swiss medical gentleman, who was famous for his skill in modelling figures in wax; so much so, that the royal family of France invited him to Paris, where he was greatly patronised. His young niece becoming a proficient in wax-modelling under his kind directions, she also attained eminence in the art, and was employed at the royal palace to teach it to the Princess Elizabeth—a lady of amiable manners, who, with thousands of other persons equally worthy and unfortunate, perished during the revolutionary disorders. Under such respectable auspices, Madame Tussaud gained an entrance into the best society, and became personally acquainted with almost all the distinguished men of the day. When the revolution broke out, she was among the few connected with the aristocracy who were spared, and this she owed to her skill as an *artiste:* you see how much good may sometimes come of learning a useful art, which may either *embellish* life in prosperity or *support* it in the day of hard adversity. Well, Madame Tussaud was spared from the guillotine, because she was required by the revolutionary leaders to immortalise them by her craft. She made figures in wax of Robespierre, Marat, Danton, and a great many other worthies, dressing them, of course, in the new fashion of the period, called the costume of the *sans culottes.* She was also on many occasions employed to take models of heads which had been severed on the scaffold; the leaders of the terrorists, as they were called, not interfering to prevent her performing this melancholy task. By these and other means, Madame Tussaud was enabled to form a large and valuable collection of models of the most remarkable individuals in France—royalists, revolutionists, generals, men of science and literature, and also ladies of distinction. With this collection she afterwards came to England, where she was permitted by many distinguished personages to take models of them in wax; and here at last we find her, now advanced in years, exhibiting her unrivalled collection in one of the fashionable streets in the west end of London.

The exhibition is open during the day; but we had heard that the effect was much finer at night, and preferred seeing it under its best aspect. Externally there is nothing to indicate the singular scene which is going on within; and, on entering, you find yourself in an elegant, well-lighted lobby, surrounded by statues. A double staircase—that is, a flight of stairs leading from each side of the lobby—unites on a landing at the top, from which, by a door pannelled with mirrors, you gain entrance to a beautiful outer apartment, tastefully laid out with ornaments of various kinds—mirrors, vases, &c. The walls, doors, &c., being of white decorated with gold, have a lightness and elegance, the effect of which is very pleasing. At one side of the door, on entering, before a small table, sits the venerable proprietor, neatly dressed in black, bowing to the company as they come in or out. Here the money is taken; and you advance through a passage, tastefully decorated with white and gold, to the principal room. But here, my dear Jane, I regret my utter inability to convey to you, as distinctly as I could wish, the extraordinary appearance of things on entering. Imagine a room about a hundred feet long (perhaps more), and lofty in proportion, the walls hung with scarlet cloth, which, before reaching the ceiling, is terminated by a ledge running round the whole room; on this ledge are placed, at regular intervals, elegant vases, gilt, with a thick garland of gilt flowers festooned from vase to vase. Over the doorway is a gallery splendidly gilt, filled with musicians who play on various instruments. All the pillars and doors are of white and gilt, which lightens the effect produced by the scarlet walls. The whole place is brilliantly illuminated with gas, issuing from numerous lustres depending from the roof. With all this grandeur, take into account the crowd of figures, animate and inanimate, with which the apartment was filled—some in groups, some standing as if in doubt whether the objects before them were of flesh and blood, or merely artificial; every countenance impressed with the feeling of gratified wonder, and looking as if under the influence of a dream.

The first figure, on the right-hand side of the door, represents the inventor of the Infernal Machine, Fieschi—the person, you know, who attempted to destroy the King of the French; and as the head and eyes move in a manner perfectly natural, you are at first startled at being brought so immediately in contact with a person of character so infamous, and who appears to be in the act of discharging his terrific instrument of death, consisting of twenty-five gun-barrels, loaded with several inches of gunpowder, besides ball and slugs; but as there are so many pleasing and attractive objects courting the attention at every step, I shall not linger beside one which is only calculated to awaken feelings of horror. Near to this first figure, forming a delightful contrast to the French assassin, is the modelled figure of an infant asleep, a beautiful emblem of innocence and simplicity. It is told of this infant, that, in the year 1796, the Seine overflowed its banks, when the child was washed away in its cradle, but was rescued by some person who saw it floating down the stream. Bonaparte, having heard of the circumstance, had the child, who was a boy, taken care of till he was a proper age, when he had him placed at the Polytechnic School in Paris, and ultimately provided for him in the army. Again, in contradistinction to this, stands the figure of Edward Oxford, who lately gained an undesirable notoriety in consequence of his insane attempt to shoot the Queen, as she was driving in the Park. There is not anything particular in his appearance. He looks like a genteelish young man, who would not attract any attention but for his crime. The next group, which is to be regarded with a much greater degree of interest, represents Louis XVI. of France, his unfortunate queen, Marie Antoinette, and the dauphin. One is led to imagine that these must be true likenesses of the originals, from the circumstance of their having been exhibited at *La Petit Trianon* at Versailles, where they must have been visited by many who could judge of the correctness of the resemblances. They were taken from life in 1790. They are dressed in the costume of the period, and are represented as sitting on a sofa, or chair of state, the dauphin standing beside them. His figure or face must have been taken subsequent to 1790, as he was not born till 1785, and here looks at least eight or ten years of age.

Near this group, on the same side of the room, are Louis Philippe, and the present Emperor of Russia. The King of the French, who is dressed in the uniform of the National Guards, is a decided likeness. This figure and that of the Emperor of Russia were taken from life. Again, amongst the crowned heads may be noticed Henry IV. of France, in a suit of chevalier armour, and Charles II. of England, also wearing a suit of magnificent armour. On the right-hand side, the attention is arrested by the majestic figure of Mrs Siddons, in the dress and attitude of Queen Catherine, in the play of *Henry VIII.*; and near her is her celebrated brother, John Kemble, in the character of Hamlet. The faces of both are fine, and singularly expressive—such countenances as one looks for in vain in the every-day world. At a little distance, in a sitting attitude, is Shakspeare, but for whom, it is possible, the talents of the last-mentioned personages might not have been brought so conspicuously forward.

On this side of the room, in the centre, we are gratified with a representation of the marriage group of the Queen: Prince Albert is in the act of holding the ring, preparatory to placing it on the finger of her Majesty, while the Archbishop of Canterbury is performing his part of the ceremony with a look of great solemnity. The Queen is dressed in white satin, with a beautiful lace robe over it, and a train bordered with orange flowers. A wreath of the orange blossom encircles her head, from the back of which a white lace veil is arranged with great elegance. Across the breast her Majesty wears the order of the Garter. Prince Albert is dressed in a field-marshal's uniform—scarlet coat, &c., with the order of the Garter round his leg, over stockings of white silk.

On this side, also, there is Lord Byron, as if conversing with Sir Walter Scott, whose likeness was taken by Madame Tussaud, while in Edinburgh in 1828. There is a substantial respectability in Sir Walter's appearance, which, on a first glance, almost leads one to suppose that he is out of place, the scene around being one of intense brilliancy and glitter. He is dressed in a plain suit of black. Lord Byron's, I should suppose, is not what might be considered a fine likeness. The face is not so expressive or intellectual in its character as one is led to expect, in seeing a representation of this distinguished poet. His dress is partly concealed by a cloak thrown over his shoulders. The face is modelled from a bust of Lord Byron executed in Italy while he resided there. Another group, comprising the King of Hanover, Lord Brougham, Sir Francis Burdett, and Daniel O'Connell, occupies a position on this side of the room; as also the Earl of Leicester, a fine venerable-looking personage, Earl Spencer, and Lord Durham. At the upper end of the room is a fine commanding figure of the King of the Belgians, taken from life in 1817; and at a little distance apart is Queen Caroline, in a court dress of black velvet, and a hat with white feathers. This brings us to the upper end of the room, where a still more gorgeous scene opens up, showing a spacious recess or anteroom, the whole of which is seen at one glance, magnificently fitted up. The walls are hung, in the richest manner, with crimson silk velvet, and the floor laid with crimson; the whole got up in the most tasteful and superb style.

The sole occupant of this grand apartment is his late Majesty George IV., in his coronation robes. The figure is said to have been modelled from life; the attitude is at once easy and commanding. The king is decorated with the order of the Bath, the order of the Garter, and the Guelphic order. The principal robe, which is the identical one worn at the procession to Westminster Abbey on the day of the coronation, measures seven yards in length, by three in width; is of crimson velvet, splendidly embroidered with gold; and, with the parliamentary robe, and the imperial robe, which is of purple velvet, both of which are also exhibited, contains 567 feet of velvet and embroidery, and cost, along with the ermine lining, eighteen thousand pounds! The throne is also introduced on which the king received the allied monarchs. The crown, orb, and sceptre, which are arranged on a table, are correct copies of those used at the coronation. The jewels, of course, are imitation, but so dazzlingly brilliant, that it would take a good judge to discover the deception. After looking on this, and turning to the comparatively humble figure of Queen Caroline, the effect is painful. She is, as it were, standing a spectator of that splendour in which she was not allowed to participate. Beyond this opening, on the other side, is the Princess Charlotte, in a velvet dress, taken from a bust for which her royal highness sat on the day of her marriage. Near to this is the late Duke of York, in the robes of the order of the Garter, said to have been taken from life.

A fantastically dressed figure of Baron Swedenborg next attracts the attention. The costume is that of a senator of Sweden. This individual, you perhaps have heard, was the founder of a small religious sect of extraordinary opinions. The next objects of consequence are his late Majesty William IV., in an admiral's uniform, remarkably well executed; and Queen Adelaide, in a court dress of dark silk velvet, her countenance more distinguished for gentleness and mildness of expression than queenly dignity.

A little farther on is another of the royal brothers, the late Duke of Kent, in the robes and orders of the Bath and Garter; but the most conspicuous group on this side of the room exhibits a cluster of six persons, arranged with good effect. The centre figure represents Mary Queen of Scots, in a sitting attitude, enduring the withering and bitter rebukes of her censor, John Knox, who is backed by John Calvin and Martin Luther, in their black gowns and bands, with black caps. The introduction of these two latter gentlemen is not in accordance with historical facts, but they add to the effect *pictorially.* On the other side of Mary are figures of Queen Elizabeth and her father, Henry VIII. Henry, I must observe, is not in the least like the bluff Harry with whose face every one is familiar—it is the only failure in the room. The dress is quite correct, but the resemblance is not in the least like the portraits of Henry VIII. Queen Elizabeth does not appear to advantage by the side of her beautiful victim, Mary; her dress, however, is very good. Mary is dressed in a robe of black velvet, with a profusion of splendid old white lace—her look expresses patient submission.

On this side of the room there is a figure of Voltaire, as if addressing an old coquette, in the dress of the period—high-heeled shoes, powdered wig, ruffles, and buckram. A little farther on is a group of eminent personages, the most striking of whom is Mohammed Ali, in a Turkish costume, and which includes Lord Palmerston; Commodore Napier, in the uniform of an admiral; Joseph Hume, MP., Lord John Russell, and Sir Robert Peel, the three last-named gentlemen said to have been taken from life. Here we have Paganini playing on his violin, and near him a fine figure of the late Princess Augusta, in a splendid court dress of velvet and white satin, with a fine set of brilliants. Nearer to the door is an interesting figure of Madame Malibran, in a black velvet dress and black lace scarf; and underneath the pedestal on which she is placed, there is a humorous figure of Mr Liston, in the character of Paul Pry, with his everlasting umbrella under his arm; and beside him, sitting at a desk as if writing, with the pen in his hand, is Frost, the Chartist leader. It was some time before I discovered that this was

not a real person—I thought him a check-taker, or some official connected with the establishment.

I must now turn your attention to the middle of the spacious room. We have been all this time pushing our way along the sides; the crowd has become more dense, and it is only by manœuvring that we can make our way along. The centre is occupied by two distinct groups, both of them interesting in no small degree. The first represents the most celebrated characters of the late war, with the members of the Holy Alliance. Opposite, on a raised platform, is a pedestal, surmounted by an eagle, the favourite emblem of Napoleon, who is standing at a little distance pointing towards it. Behind him stands Marshal Ney. On the floor, by the side of Napoleon, are the Duke of Wellington, Lord Hill, and the Marquis of Anglesea. At the foot of the pedestal is seated the Emperor of Austria, in the white coat and uniform of the Austrian guards. His face is singularly mild and benevolent in its expression. Behind the emperor are the King of Prussia and Marshal Blucher. The Emperor of Russia, in the uniform of the Russian guards, occupies a conspicuous place, and is understood to be offering, on behalf of the allied monarchs, the kingdom of France to Napoleon. Next to the pedestal, behind, is Murat, King of Naples; and between him and Ney is Roustan, a favourite Mameluke, in an Egyptian costume, who is said to have saved Napoleon's life while in Egypt.

On the floor, on this side, is Prince Talleyrand, as if conversing with Bernadotte, King of Sweden; and next to him is Lord Nelson, in an admiral's uniform, from a cast taken from his face. Napoleon is dressed in the uniform of a chasseur of the Guard—a white kind of surtout-coat, with long boots—and bears the star of the Legion of Honour. His face is said to have been taken from life in 1815. This is a striking group altogether; bringing before you, as if living and breathing, those celebrated men with whose names every one is more or less acquainted. I know, my dear Jane, that your love of history will have enabled you, long ere this, to become familiar with not only their names, but with the parts which they played in the great transactions of their time.

Between this and the next group stands a figure of Madame Tussaud herself, dressed in a neat black silk cloak and bonnet. This is a capital deception. You would not for a moment suppose the figure to be artificial, did you not, perhaps, in the crowd, come up against it rather rudely, and having turned to apologise, you see that the eye is fixed as if looking upon a female who appears reclining on a couch asleep. There is a black lace veil thrown over the latter figure; and, to your amazement, you see the chest heaving, as if breathing gently in sleep. This is ingeniously contrived by springs, but looks so perfectly natural, that you can scarcely turn away. This sleeping beauty represents a young Frenchwoman, who was the widow of a lieutenant-colonel of the body-guard of Louis XVI., killed in defending the palace of the Tuilleries, in the attack of August 1792. This lady was so unfortunate as to incur the vengeance of Robespierre, was condemned by him to the guillotine, and perished at the age of twenty-two.

The second group exhibits the coronation of the Queen, who is seated on a throne in her crimson velvet robes. The crown has just been placed on her head by the Archbishop of Canterbury, who is standing behind, as if imploring a blessing. The Queen is holding in her hand the orb and sceptre, the insignia of royalty. The archbishop is supported by the Archbishop of York on his right, and the Bishop of London on his left hand. Next the Queen, on the right, stands the Duke of Cambridge; then the Duchess of Kent, in a full coronation robe of velvet: next in order stands Lord Melbourne; next to his lordship is the Duke of Newcastle; and last, on this side, is Lord Lyndhurst, all robed as peers. At the other side of her Majesty is the Duke of Sussex, wearing the robes of a peer, and the collar of the Bath and star of St Andrew; next to him is Earl Grey; then the Duke of Sutherland, all of these being also in their robes; Earl Mulgrave comes next, followed by the Marquis of Londonderry, in the uniform of the 4th Hussars, wearing the order of the Guelph; and, lastly, the Duke of Devonshire, in a court dress, wearing the order of the Garter.

At the upper end, overlooking this scene, are three female figures, raised on pedestals, representing the three kingdoms, holding the appropriate emblems of the three countries—England, Ireland, and Scotland. They are dressed fancifully with helmets and white plumes.

There is one figure more, which I had almost forgotten, and he is not the least celebrated person in the room; this is Mr Cobbett, who is sitting on a form, as if admiring the scene around him. He is dressed in a plain grey suit, with his hat on. He wears spectacles, and holds a snuff-box in his hand, as if inviting his neighbours to partake. His head moves from side to side, and you might sit by him for an hour without discovering that he was not like yourself—a visiter. This, my dear Jane, closes my rambling account of Madame Tussaud's famed exhibition, which you must not allow yourself to associate in your mind with those tawdry and tinselled spectacles which are often to be seen in provincial towns; there is nothing paltry or mean, or got-up looking about it, but, on the contrary, every thing bears evidence of the excellent judgment and liberality of the indefatigable conductor, Madame Tussaud, who, I believe, changes the linen, laces, &c., every week or two, so that they are all beautifully clean and neat. Nor is there that stiffness or awkwardness in the figures that one might expect in things so purely artificial, the face and hands only being composed of wax, the rest of the person, I believe, is stuffed so as to resemble nature as closely as possible. Besides the apartments I have mentioned, there is a room which is shown separately, an extra charge being made for admission. This apartment is allotted to such personages as Burke, Robespierre, Courvoisier, &c.; but as the contemplation of these gentlemen could not be productive of any thing but horror, I thought it a pity to destroy the very pleasing impression which was left by the more interesting exhibition in the large saloon, and so I passed them over.

OCCASIONAL NOTES.

A MAP OF RACES.

Dr Kombst of Edinburgh has published a map of Europe, in which the locality of the various races is pointed out by means of colouring.* The idea is a good one, and the execution stamps the author as a man of ample knowledge and philosophical judgment. We could only wish that the colouring were executed with somewhat greater pains, and that the patches below, designed to serve for reference to the colours of the map, were on a larger scale, so as to ensure greater distinctness. The political history of European *countries* has long occupied a sufficient share of attention. It is now beginning to be discovered that a knowledge of the *race* to which the people of a particular country or district belong, is a much readier key to their character. We would therefore say, that a careful perusal of Dr Kombst's map, and the information condensed along its margins, would give more illumination than the reading of many volumes. It is instructive to see at a glance into what a narrow space (comprehending central Ireland, the north-west of Scotland, Wales, and Brittany) the Celtic aborigines of Europe have been pushed by the races of higher endowment and civilisation which came after them—and what comparatively large spaces are occupied by the Teutonic and Sclavonian tribes. Nor is it less so to observe the results of race characters in the institutions, civil and religious, of various countries.

Dr Kombst joins Dr M'Culloch and Dr Prichard in a theory which, we believe, has not as yet attracted much attention—namely, that the ancient Greeks were fundamentally a mixture of the Celtic and Teutonic branches of the Caucasian variety, the Teutones predominating in the Doric, and the Celts in the Ionian states. He believes the Heraclidæ to have been a later and additional body of Teutones thrown in upon the previously mixed inhabitants. He adduces, in support of this doctrine, various terms descriptive of persons which are only appropriate to the Teutones, as *xanthos*, fair-haired, applied by Homer to Menelaus; *glaukopis*, blue-eyed, applied to Minerva; *euknemides*, straight-legged, used by Homer with regard to the Achaians generally. Such terms, he says, could only exist in a country where the peculiarities they described were common, and where the opposite peculiarities were also prevalent, being in reality analogous to our names, Reid, Black, Brown, and the German Roth, Schwarz, Braun, &c. Not to speak of language, Dr Kombst points to resemblance of dispositions and manners, as shown in Ottfried Müller's work on the Dorians. Skulls found in ancient Greek tumuli exhibit a great resemblance to the skulls of the Germans. He adds—"An accurate study of Greek statuary, made in different capitals of Europe, especially at Paris, has given me the most evident proof that the sculptors themselves were aware of a difference of race amongst the Greeks, as far as exhibited by a different bodily appearance. We find there models of the Celtic and of the Teutonic variety; Hercules, for example, and Jupiter, are every inch of them Teutonic figures. Not to speak of what would probably be called ideal portraits, let us look at real ones, and we shall find that the most distinguished Greek philosophers, poets, orators, statesmen, had Teutonic heads." "I could likewise show that a great deal of Teutonic blood flowed in the veins of the Romans." After this, no one can be surprised to hear that "the Teutonic variety has every where conquered and trampled under foot, nay exterminated, the other varieties with which it met in its progress towards the west.

Amongst a number of general propositions, stated by the author, with regard to the varieties of mankind, we find the following:—"The different species and varieties have an instinctive consciousness of their natural physical difference, which may to a certain extent be overcome by a great degree of mental culture, but which in primitive conditions is expressed by a mutual aversion and disinclination for marriage. This peculiarity has often been denied by well-meaning but one-sided and abstract-thinking philanthropists; but the whole history of all ages shows it most distinctly to exist."

COMMERCIAL TRAVELLERS.

A knight of the whip, who seems to have a leaning to the temperance cause, addresses his brethren in a little pamphlet* respecting the customs of the Travellers' Room. He sets out by describing how, as an isolated class in the community, they "have made less progress in the melioration of their condition than perhaps any other, compared with the valuable opportunities they possess, and the sphere in which they move. How is this?" asks the knight of the whip; and, if the proposition be correct, we ask the same thing. The answer which casts up in the sequel is, that commercial travellers generally, though often disposed to enter on a course of improvement, are placed at a serious disadvantage, by being obliged to attend to certain usages with respect to their mode of living at inns. We shall allow the writer to explain his meaning by an extract from the works of Mr Dunlop. The travellers are met in the room appropriated to their use, and the solemn duty of dinner is in the act of performance.

"'When (proceeds Mr Dunlop, quoting from a previous writer on the subject) fish is leaving the table, the president inquires of the *vice* and the company what wine will be agreeable. The wines generally used in the commercial room are port and sherry. Sometimes other wines are introduced, but in such cases the party is a small and select one. The result of the president's inquiry is, usually, his desiring the waiter to bring in a bottle of sherry. This is placed on the right hand of the president, who takes wine with the vice, and afterwards with the other gentlemen at table. Should the party exceed eight in number, two bottles of sherry are ordered to come in both together. Pastry is paraded, succeeded by cheese, which is the signal for the president's ordering port wine. When the cloth is removed, clean glasses are placed before each person; and the president, filling his glass, passes the decanters to the gentleman on his left, who, after filling, pushes them to his neighbour, and so on, till they again arrive at the head of the table. When they have completed this tour, the president drinks 'The Ladies,' an act of gallantry which each gentleman immediately imitates. The bottles then describe the same circle as before, and then the health of the reigning sovereign is proposed. After these toasts, it depends upon the president whether each succeeding glass shall be consecrated by a toast or drunk in silence. If the former be the plan adopted, the vice-president is called upon by the president to give a toast, and after him every gentleman present, in succession. When the bill is called for, any person can rise and leave the table, *without any apology for his thus leaving; he has fulfilled his share in the proceedings, and can now quit the table sans reproche.* When you dine alone, you are expected to order a pint of wine. It is a usage of the room to order a glass of wine, or spirits and water, in the evening. The expenditure of one shilling in this way every night, is considered to be one of the claims of the innkeeper upon the frequenters of his commercial room, and the liquor is generally ordered, whether used or not.' It is not unusual, among some parties, to treat with drink those who give mercantile orders; and one informant has known of a traveller, who, having been supposed to have lost orders by not sufficient treating, was, in consequence, turned off by the house which employed him. The first time a traveller visits a particular town or county, he is fined in a bottle of wine to the company; and a certificate is given by the chairman that the fine has been paid. Not only are customers, in some cases, to be treated at or after giving orders, but also at settlement of accounts. In short, this class is as much fettered and enslaved by drinking usage as almost any among the working ranks; and it would evidently require an exertion of moral courage which few possess, to travel a large part of the year, and to controvert, single-handed, all the drinking usages of all the commercial rooms within the traveller's beat, or journey."

The knight of the whip of course arrives at the conclusion, that habits of intemperance are the ruin of commercial travellers. They spend much precious time worse than uselessly, injure their health, and empty their pockets; and all for what?—*the good of the house.* Such is the presumed and ostensible cause; but our knight thinks that the evil is also in no small measure owing to the inclinations of the travellers themselves. "Is a traveller cold with his outside ride?—he calls for a glass! Is he fatigued with carrying his bag from shop to shop?—he takes a glass! Are orders scarce, and his mind depressed?—he still calls for the other glass!! Is the dinner good?—then it ought to be enhanced by an extra glass!!!" The usages are therefore to be considered as chains not unwillingly borne. "Think," he adds, "of the personal example of these men; what attraction would it exhibit, and what good disseminate, were it uniformly marked by intelligence, sobriety, and the nobler virtues of human nature! In place of this, however, 'the road' is marked by puerile monotony, relieved only by eating and drinking, and the eternal, ever-present, ever-soothing idea—'I think I'll pull the bell, and have a glass of ——.'"

Our Knight endeavours to impress his brethren with the idea that they would do themselves much good and no small honour, by reforming the habits of the travellers' room, pulling the bell less frequently for their own gratifications, avoiding on all possible occasions to give treats, and organising such regula-

* Ethnographic Map of Europe. By Dr Gustaf Kombst, F.R.N.S.C., &c. Edinburgh: John Johnstone, and W. and A.K. Johnston.

* Our Commercial Travellers. By a Knight of the Whip. Glasgow: Gallie. 1841.

tions as to payment for food and lodging, as would "place the landlord on a right footing," not forgetting "a more seemly way of remunerating waiters." We possess no means of judging how far it would be possible to effect these reforms; but the subject is surely worthy of the attention of this numerous and respectable body of men. Certainly, there is no class of the community who have so much in their power in the way of improving the customs connected with inns and travelling.

SPENCER T. HALL, THE SHERWOOD FORESTER.

We are always glad to make our pages the vehicle of conveying to the world the history of merit and perseverance struggling against and overcoming the obstacles of fortune. What we most desire to see is the working-classes adopting for themselves—taking into the economy of their lives—a virtuous and patient endeavour to extract the greatest possible amount of good out of the toil and privation, more or less severe, which is the lot of their existence. We want to teach them that they can do infinitely more for themselves than any outward aid can accomplish for them. We want them to feel their responsibility to act with energy and forethought under their circumstances—to accustom them more and more to meet the hardships of life by virtuous and patient resolution—to bring them to think and reason correctly—and to induce them to cherish as patterns those of their own class whose lives attest the power of virtue and effort. "Diligent self-culture" is a phrase which must become a household word, and must be understood as practically as the commonest household duties.

About a twelvemonth since, a small neat volume, entitled "The Forester's Offering," came under our notice, purporting to be the production of Spencer T. Hall, a self-taught young man, pursuing the craft of an operative printer. Its contents are prose sketches of Sherwood Forest, of which its author is a native, and pieces in verse. The merits of the book would have claimed our attention, quite independently of the history of its composition; but author and volume taken together, we became considerably interested by it. The prose, which is divided into four chapters, relative to Sherwood Forest, its appearance and legends, is perhaps the least meritorious part of the production. Like most young authors, Mr Hall writes in too high-flown a style, and with too little regard to precision and brevity. We notice this circumstance, however, for Mr Hall's benefit. Should there be a subsequent edition of his volume, we recommend him to set out with telling where Sherwood Forest is—what is its extent and general character at the present day—is it all trees, or only patches of woodland intermingled with open fields—what roads are there through it—what are the occupations of its inhabitants—is the village of Edwinstone its capital, and what sort of a place is it—and so on, with various other interesting matters, which Mr Hall's knowledge of the district would easily enable him to give. Of his poetical efforts we can speak more favourably. From the poem "My Native Cottage," we copy these two stanzas. He is speaking of his mother.

"Oft, too, would'st thou describe my country's ports,
Crowded with gallant ships from every clime;
Her smiling palaces and frowning forts—
Whate'er of her was beauteous or sublime,
The fruit of modern taste or ancient time—
From domes remote that through old woodlands rise,
To cities crown'd with spires, that proudly climb,
And flash the sunlight back through summer skies—
Until my young soul swell'd with gladness and surprise.

And much I wish'd, as in my mind would grow
A sense of Britain's grandeur and her might,
That in her sons a warm desire might glow
To use their matchless power and skill aright,
And in the ways of love and truth delight.
For, oh! an early consciousness was mine,
That power misguided operates but to blight
All that is glorious, beautiful, benign—
And glooms a world with woe which else in bliss might shine."

We also very much admire the following verses, addressed to the sons of one of his friends on their return to school after vacation time:—

"Once more in vigour turn, dear boys,
To your scholastic duties;
From knowledge spring life's noblest joys,
Its comforts and its beauties.
Away, then, for the days of youth
Ye cannot spend more cheerly,
Or nobly, than in wooing truth,
Which, winning, prize most dearly.

For though youth's budding hopes may bloom,
In manhood but to vanish;
Time cannot learning's stores consume,
Nor care its pleasures banish.
Oh, no! its joys still round us glow,
When we through life have striven;
Since only blossoming below,
They ripen but in Heaven.

Then onward press with purpose true,
With ardour never-failing,
Since slighted chances late to rue
Is surely unavailing.
Your *means* of learning, strength, and skill,
And wit, I do not doubt them;
But having these, and not the *will*,
You'd better be without them.

Away, away! and ever may
Your tasks be light and pleasant,
As are your uncheck'd sports to-day,
While with your parents present.
And when ye to their arms return,
Fresh flowers of promise bringing,
No weed of vice be theirs to mourn
Among your virtues springing.

Oh! ever love them, and obey;
For as through life ye wander,
Most true you'll find this lowly lay,
Which oft and deeply ponder:
Hard hearts and false we meet and rue,
That rightly ne'er regard us;
But parents still are kind and true,
Though all beside discard us.

Farewell, then, for the days of youth,
Ye cannot spend more cheerly,
Or nobly, than in wooing truth,
Which, winning, oh prize dearly!
For learning's joys will round you glow,
When ye through life have striven;
Since only blossoming below,
They ripen but in Heaven."

Mr Hall's book has obtained for him great popularity in his native district of Sherwood. In a Sheffield newspaper now before us, we find a report of a meeting of the inhabitants of the Forest (Nov. 3, 1841), to the number of above a hundred, at the village of Edwinstone, to present to him a carved oak walking-stick; and as Mr Hall's speech, in returning thanks for the present, contains a history of his mind and fortunes, we shall conclude this notice by extracting the most material passages.

"It has been requested," said Mr Hall, "that on this occasion, for the encouragement of others in circumstances like my own, I should give a natural history of my mind, to the cultivation of which, under what the world generally calls *difficulties*, but which I only call *stimulants*, is to be attributed the gratifying position I now occupy among you. I was born on the 16th December 1812, and I am consequently near upon twenty-nine years of age. My mother is dead; but all the rest of the family, seven brothers and sisters, still live in or near my birthplace, which is a little thatched cottage, only one storey high, at Sutton in Ashfield, a small town three miles within the ancient western boundary of the Forest. One of the principal tributaries of the river Mann, that runs so beautifully through this village, passes by my father's door, and I have sometimes heard its murmurs when sitting on the hearth. The first deep poetical impression I recollect receiving, was when so young that my father was carrying me in his arms. It was from seeing the gardens all covered with white, and, in a breezeless morning, the snow falling slowly and solemnly, flake by flake, from a calm dim sky upon them. This was the early awakening of my mind to the sublimity of simple and common nature, which, because it is simple and common, we so little perceive and enjoy. I once received another impression akin to this, but from different causes. It was one bright February morning, when I was seven or eight years old; it was in a lane at Fulwood, about a mile from Sutton. The whole landscape was sparkling with gems of frozen dew—not hoar-frost, but that bright powdery scattering which is next akin to it. A little cluster of rustic cottages were sending up their smoke-wreaths just by, and a green holly-bush, the only green object to be seen, was sweetly glowing at a bend of the lane beyond them, making me feel, as if by stepping as far, I should be all that nearer to the coming spring. Well, it is a very wide landscape that spreads away from that spot, cut into diamonds by hedgerows, and dotted with cottages, farms, churches, villages, corn-stalks, windmills, villas, and all the other indications of quiet rural life, up to where the North Peak of Derbyshire brings its blue hills in a semicircle, and hems in the prospect. All this, in the sunshine, was very delicious; and quietly pondering over it, the love of rural beauty bewitched my heart, almost like the sweet and silent joy of the love of a young maiden. Such, with me, was the beginning of poetry.

I will now tell you the way in which I learnt to read. My father being a shoemaker, and having several tiers of last-rails in his workshop, got the alphabet printed in large and small characters, and had it pasted at intervals along the rails. As soon as I could begin to scramble about, I tried to walk by holding on these rails; the letters caught my eye; and so I learnt to read and walk together—thanks to the ingenuity of my father. I am free to attribute all my learning to this source; for though I never went to a charity school in my life, my whole education, books included, never cost so much as a pound. I began to work at seven years of age, being employed from that to eleven at winding cotton for the stocking-makers, and nursing a poor brother who could not help himself, and whom I partially cured by wandering out with him into the fields, where the fresh air strengthened him, whilst the scenery gladdened me. At eleven, I began to weave stockings myself; and to show you the sort of life we now led, take one illustrative anecdote, of which I could give a hundred. In addition to our cottage garden, we had then a one-acre field, which we used to plant alternately with potatoes and barley. One spring day, when I and my brothers had been getting on faster than usual in the stocking-frame, my mother came to us, and said, "Good lads, go on; and if you get your work done soon, you shall go with your father to roll the barley after drinking" (meaning tea-time). So away we went, and harnessed ourselves by shifts to a large stone roller, two at a time, our father taking his turn with the weakest of us; and so, after a good day's work in the stocking-frame, we *amused* ourselves at night by rolling the barley field.

At this time I had, through the kindness of a pawnbroker, the privilege of reading such books as had been pledged with him and not redeemed, of which I make this public acknowledgment with thankfulness. I had also access to the library of the national schoolmaster, Mr James Jennings, a highly respectable and kind man, who is now dead. I mention his name with gratitude and reverence. My leisure hours were often spent at a candlemaker's melting-house, where a merry and intelligent exciseman, of the name of Helston, who had seen something of life through his residence in various parts of the country, gave me a good deal of information. Mr Barrott, the chandler, was an affable and well-informed man, and was fond of conversing with me. He lent me the Life and Works of Dr Franklin, the reading of which gave my mind a new impulse, and determined me on running away, with a view to returning at some future time as a printer. The burning, the languishing, and occasionally the maddening sense of my rustic enthralment, at length broke bounds. [He proceeds to say, that when sixteen years of age, upon a cold evening in January 1829, with one shirt, one pair of stockings, a volume of voyages and travels, which he had purchased in sixpenny numbers, together with a few numbers of the "Dictionary of Arts and Sciences," all tied together in a bundle, and dressed in the plain and rustic fashion of a country Quaker, with only thirteenpence half-penny of cash in his pocket, he privately left the paternal mansion, determined at all hazards to push his way in some new field of industry.]

I will not tell you of all the hardships, and insults, and kindnesses, I met with; it would detain you too long. Three nights I lay without sleeping; the first in a damp bed in an inn at Nottingham; the second on the floor of a cold workshop in Loughborough, where I heard the watchman's half-hourly cry throughout the whole night, and found at day dawn that the snow had drifted under the door to the very sack I lay upon; the third night again at Nottingham, in the house of a poor but hospitable friend, where, though the bed was soft and dry, I could scarcely get a wink of sleep for intense thinking. The adventures of the next five weeks would fill a great book if written. At the end of that time, I called one day at the *Mercury* office in Nottingham. Mr Shaw, then one of its proprietors, had previously given a complimentary call on my father, and had seen me working in the stocking-frame, when I explained to him with great earnestness its mechanism and history, with which he seemed pleased. I now thought he would in turn show me how printing was performed. On entering the office, the workmen were highly amused with my rustic appearance. But rustic as I was, I had read Dr Franklin, and made myself master of many of the technicalities of the business, and Mr Shaw was surprised at the facility with which I used them. Determined not to return home, and having nobody to depend upon but myself, I called at the office again to ask if they could tell me of any situation that had been advertised. Mr Shaw told me they could not, but said if I would walk with him towards his house, he would have some talk with me. He said, he was sorry I was not younger, as there was a vacancy in the *Mercury* office for a lad, which in some respects might suit me. I asked why age should be an obstacle; he replied, it was not my age, but my size and the stiffness of my fingers from rustic occupations, which would prevent me succeeding as a compositor. I believe at that moment my heart swelled considerably beyond its usual size, as I eagerly answered, that "application alone could soon remedy that." He said, he was afraid that it would not; and I left him embarrassed with conflicting emotions. Next morning, however, he sent for me, and made proposals—that I should serve him for seven years, beginning with the lowest situation in the office; that I must be an out-door apprentice, and have four shillings a-week for the first year, five shillings a-week for the second, and so on to the end. He also said, that though that should be the stipulation, if I merited it, something better might be done in time. The engagement seemed hazardous; but I was anxious and hopeful, and accepted it. Shaw's advice on the occasion was very shrew and sound; he said, to make it tolerable, I must consider myself two years younger to begin with.

For one year I made four shillings a-week find me in food at Nottingham, with an occasional cake or lump of bacon from my mother at Sutton, and my father paid my lodgings and washing. At the end of the first year, my master was so well satisfied with me, that instead of giving me five shillings a-week, he said he would let me eat and sleep in his house. I accepted his offer, and had no cause to repent it. If all I earned had been for myself, I could not by any possibility have worked harder than I did. After I had been with him a few years, it was stipulated, that all I earned above four and twenty shillings a-week, independently of proving the columns, and helping to work off the second edition of the paper, should be my own for clothes and pocket-money. At this time, too, Mrs Shaw, who was a very kind woman, undertook that my washing and mending should be done in her house. I was well fed, and my extra work sometimes amounted to half-a-crown a-week. But working once, and often twice, a-week almost all night, soon seriously injured my health; and I lost half my eyesight, and one-third of the power of my lungs, at Not-

tingham. Yet still, God be thanked, I had many joys and comforts. Rural life and scenery never lost their charm, and on the banks of the Trent, or on Mapperley Hills, in reading, or in the society of good and intelligent men, my spare hours were seasons of pleasure and gratitude. At seventeen, I one day by accident picked up Bloomfield's "Farmer's Boy." On reading its very invocation, a new fire was kindled in my heart—the fire of poetry—the power of expressing my thoughts and feelings. The spirit which had struggled to express itself in painting rough sketches found vent; I shed tears of gratitude, and hastened to put in practice my new faculty, by attempting some lines descriptive of Clifton Grove, the beloved haunt of Henry Kirke White. From that time, I found the society of more important people. The Howitts were then all living at Nottingham, and honoured me with their notice and friendship.

When I was twenty-one, Mr Shaw suddenly lost his sight, and soon after his interest in the paper. I engaged to complete my term of service with Mr Bennett, the new publisher. Under my new engagement I had ten shillings a-week for the first year, and twelve for the second; but bad health often prevented me from working, when, of course, I got little or nothing. When my apprenticeship was ended, my master expressed himself so well satisfied with my conduct, that he offered, if I could raise a printing-office at my native place, to supply me on credit with materials for commencing business. Several kind and generous friends who knew me advanced the necessary capital, and little more than seven years from running away, I drove past my native cottage with a new printing-press and with a loved and loving wife." Owing to various causes, Mr Hall relinquished his printing business at Sutton, and became foreman in the office of Messrs Hargrove at York, the publishers of the *York Herald* and *York Courant*. He soon after published the volume we have noticed above.

He concluded his narrative thus:—"With regard to my future efforts, though uncertain in their course, their result must be good in the end, because I have laid down two unerring principles. The first is taught me by the great lesson of *circumstances*, which are the language of God; it is, that every act, and every word, dishonest or insincere, must inevitably defeat its own intent; and the other is that beautiful sentiment of John Galt, "That whenever we do a good action to another, it is the benevolence of heaven directing us to achieve some good for ourselves."

THE SOLDIER'S RETURN.

AN IRISH STORY.

It was about the close of the year 18—, when, in consequence of the apparent tranquillity which prevailed in Europe, the allied sovereigns had determined upon recalling the army of occupation from France, although the time stipulated for its remaining in that country had not yet expired. Many of our soldiers were returning to the respective places of their birth—some to spend among their friends the short period afforded by leave of absence, and others, who had obtained discharges, to pass the remainder of their days in peace. Anticipated joy cheered their homeward way; but, alas! in many instances, they were doomed to bitter disappointment: numbers returned only to find the grave closed over their dearest kindred—a parent, a wife, or a child. More than one veteran had passed scathless through the battle-field, to stand a stranger in the place of his nativity. All that he had once loved had ceased to live, and the only desire which remained to him was to be with them and at rest. Others, however, were less unfortunate; and many joyous greetings took place of husbands long parted from their wives, and of fathers, for the first time, perhaps, permitted to embrace their children, or to behold a grown-up lad or blooming girl where he had left but a baby at its mother's breast.

It was about the period of these events, when, on the afternoon of a fine autumnal day, two Irishmen of the lower order were in the act of separating for their homes. Just at the moment their attention was attracted by a stranger who was approaching; his air and appearance were at that period most likely to excite observation—his dress plain, but evidently new; a small bundle, suspended from a stick, hung over one shoulder; while his bold upright carriage and manly step indicated the practised soldier: a good judge would have pronounced him about thirty years of age.

"There," said one of the persons above alluded to, "goes a fine cliver fellow, Paddy. I'll engage it's returnin' from the wars he is, now that Bony's down. The sodgers 'll be gettin' lave to see their friends, you know, and it's well for them as has such smart chaps as that to boast of."

"He's a nice clane boy indeed, Mikey," replied the other, "and looks as if he hadn't been abroad for nothing; though it's not much, I'm thinkin', a sodger can save."

"That's the truth, Paddy; but, poor or rich, he'll be a welcome sight to them he's goin' to. It's not many the likes of him the bullets spared. Many a fine fellow lies cowld and stiff beyant the wather there: but he's just goin' your road, so he'll be company for you, and tell you all the news beside."

The subject of these remarks had just left the high road where the friends were conversing, and now continued his course in the same direction which Paddy was about to take; the suggestion of his companion was not lost on this person, the natural curiosity of whose disposition was also roused.

"Troth," he rejoined, "I believe I'll take your hint; it's a long road, you know—so, good-night."

Here the two parted; but to the latter we are now to request the reader's attention. Having overtaken the stranger, he accosted him with the usual salutation, and observed, that if he wished to hear of a resting-place for the night, he would be glad to serve him.

The stranger, though apparently little inclined for conversation, replied, that he had few relations alive, but wished to reach the house of a comrade's mother, which, as he had been informed, was in this neighbourhood, and where he had no doubt of obtaining lodgings.

"What's the name of the place?" asked the other; "maybe I could put you in a short road."

"——," returned the soldier; "and, if I was told right, it can't be very far off now."

"That's thrue enough," replied Paddy; "but it must be a long time since your friend left these parts, for nobody has lived there for many years back, since Peggy Marks was forced to lave it."

"That's his mother's name," rejoined the stranger, in a more hurried tone; "do you know any thing of her?"

"Sorra much of late," he replied; "but I was thinkin' it must be the same, for a son of hers, by a first marriage, listed ten years ago; a fine fellow he was, too; but we heard tell he was kilt in the wars."

"No such thing," said the soldier; "he's alive and well, and will soon get leave to come down and see his friends."

"Why, then, it's myself that's glad to hear that same," remarked Paddy. "I only hope thim that are his flesh and blood may say as much."

"Do you doubt it?" interrupted the other, earnestly.

"There's no answerin' for thim that's hardened in sin," he replied; "it wasn't long after her first husband died that Peg tuck to drink: she married a pedlar fellow that used to be rovin' about the country, gettin' a livin' nobody knew how; for though he carried a pack, sorra mortal ever saw him sell any thing. Poor Bill was quite a child then, and, you may be sure, hadn't an aisy life of it; he got the worst of usage—scouldin's and beatin's. But all didn't change his forgivin' heart; and when he grew up, he laboured hard for thim that never thanked him or said well he did. If it wasn't for him, I don't know what they'd have done, for you may be sure it wasn't much the pedlar worked. But such a state of things couldn't last; they druv the poor boy out in the end, on the wide world, to seek a shelter where he might. He came to me then, for a reason he had. He used to be lookin' at a little girl, you see, that was stoppin' with me at the time—a wife's sister's daughter. There was a recruitin' party in the country at the time, and, to make a long story short, he listed. It's myself that'll never forget the day he was marched away, with the red, and blue, and white ribbons in his hat, and the merry music playin' to keep up the crathurs' spirits. He needed something to cheer him, for his heart was aching, and the grief was heavy upon him. It was a sorrowful day to us all, and the tears were nearer to my own eyes then than now. But where's the use in talkin'?—he went away, and we never heard more about him. As for the mother, she and her husband went to the bad intirely, and at last were turned out of the farm; they went thin and lived in a bit of a place on the moor; but misfortune wasn't long in followin' them. The pedlar was taken up for a murder, and hanged; Peg herself, as the neighbours thought, didn't get out of the business with clean hands; but be that as it may, she escaped the law, and is now livin' on the moor, with the misformed crathur she had by the pedlar."

"I hope she behaves kinder to it than she did to her first son," remarked the soldier; "but what's become of the young woman you mentioned a while ago?"

"That's my niece, Mary Casey," returned the other; "she has been the constant crathur to poor Bill ever since—not that she mightn't have been married over and over again, for she had more than one offer that a girl might be glad to close on."

The soldier grasped the speaker's hand; what he said we shall not here relate; it is sufficient to say, that before they parted all reserve was over. Paddy, indeed, laboured hard to get him home with him that night, but in vain; he determined to seek the residence of Peg Marks; and so, having obtained directions how to proceed thither, exchanged a hearty good-night with his companion, and pursued the way alone.

His path lay along a rugged road, which must have been almost impassable in wet weather, while, under the most favourable circumstances, it was tedious and difficult. After threading its winding and uneven course for about a mile, our traveller at length arrived at the spot he sought; the cabin was easily recognised, for it was the only one in the place. On arriving at the door, he knocked once or twice without obtaining any answer, though he could plainly hear voices within: their exact expression, however, was not distinguishable; one thing alone could be inferred from the tone—whatever was being said did not proceed from satisfaction. This circumstance did not deter the visiter; he repeated his knocking much louder and with more effect. "Who's there?" uttered a hoarse and dissonant voice from within. "One that has travelled a long way, and is in want of a place to rest in for the night, and, besides, has a message for the good woman," was the reply.

"Eh! what's that? who's there?" asked another voice, hurriedly, as if excited by the words which had been spoken.

"One that would be glad of a word or two with Peggy Marks, and would ask a night's lodging, if convenient," was again the reply.

"What can you be wantin' wid me, good man? and who's thim that'd be sending a message to a poor disolate crathur? and, as to lodgings, is it to a poor widdy-woman you'd be comin', that hasn't as much as would buy a morsel of bread for herself and the poor orphan here?"

"I'd take nothing without paying for it," returned the soldier.

Here there was a low murmuring between the persons inside, which lasted for a few minutes, and was at length broken by one of them saying in a louder tone—"Open the door, Jemmy, aghra; let him come in, at any rate."

The command was instantly obeyed, and our traveller admitted. He stood for a moment or two gazing on the inmates of this miserable abode: the younger of the two, having closed the door carefully, resumed the seat which he had doubtless occupied previous to the interruption, at the side of the fire opposite to that at which the old woman was still sitting. The mother and son presented a picture which it was impossible to disregard, although the feelings excited by it must have been any thing but pleasing. There is, however, something in the sight of human degradation, which will often rivet our attention while it gives us pain: no doubt, it was under the influence of such a feeling that the stranger now stood mutely gazing on the two individuals before him. At the side opposite to the door, and crouched upon a low stool, close to the fire, sat the woman so often referred to; the dry furze which had been thrown upon the hearth, though at that moment sinking into embers, still continued to send forth a blaze, which shot a lurid glare around, and imparted to her countenance a most unnatural hue. That was a countenance, indeed, which required no additional circumstance to heighten its deformity—marked not only by the effects of dissipation, but distorted by the worst passions. Directly opposite the woman, as we have already observed, sat that singularly made creature—designated by our friend Paddy "a misformed thing"—with his dark grey eyes fixed with an *inquiring* gaze upon the person of the visiter. To convey an adequate idea of this *outré* being, is beyond the power of verbal description. His full height did not exceed four feet, of which the head formed a considerable part; this, without exceeding the limits of reality, we may say to have been equal in bulk to any two of an ordinary size. The room which they inhabited was truly fitted to be the abode of wretchedness: there was no light except what proceeded from the fire; this rendered horribly visible the living creatures near it, while it brought into shadowy outline the remoter objects of the place. These were in keeping with the poverty of the inmates. A few miserable articles of furniture, such as might barely accommodate them at meals, and a low settle-bed, comprised the whole. It should be observed that this was not the only room; for a partition, running from within about two yards of the door to the opposite wall, effected another, where the woman usually slept, the dwarf occupying the settle-bed just mentioned.

The soldier stood as if entranced, till roused by the voice of the old woman. "And what would ye be wantin' wid the widdy, honest man?"

He made an effort to reply, but so powerful was the effect of what passed before him, that he was for a time incapable of proceeding; and even when he did commence, there was a tremulous motion of the lips, and a faltering expression of the voice, that indicated an extreme degree of agitation. He succeeded, however, in explaining to her that he was the bearer of tidings from her son, who had lately returned from abroad with his regiment, and expected to see her shortly.

"Then it wasn't thrue he was kilt, after all, wasn't it?" she asked.

"No; he was wounded, and suffered very much," returned the soldier.

"Sure, bether couldn't happen him; neither *loock* nor grace ever attind thim that forgets the mother that bore them," observed the hag, in a somewhat louder voice.

"That's the thruth," interrupted the dwarf, who, having surveyed the stranger for a time, seemed to watch with some earnestness what was passing.

"It gave him great trouble that he ever enlisted," remarked the soldier; "but he never forgot his friends, and always intended returning after the war was over."

"But didn't he send any thing to his ould mother, barrin' the message?"

"Why, no, as he intended to be with her himself so soon," was the answer; "but if you're in want, I'll be willing to advance you a little for his sake."

"Eh! what?—did you say you'd give money, man?" she asked, with some earnestness; and again, after a short pause, during which she seemed to be busy with her own thoughts, hurriedly continued—

"But you were wantin' lodgings for the night, weren't you?—it's a poor place, you see, and hasn't much of accommidation."

"For that matter, a soldier isn't very choice at a pinch," he returned; "and it's not hard to please one that's tired with long travelling."

"But then you'd be likin' something to eat and *dhrink*, maybe; and what can the poor widdy and her orphan here spare?" she again observed.

"Indeed, you're right enough in that," he replied; "but if it could be got convenient, here's what'll get enough for all."

"Eh!" ejaculated the hag, with evident delight, as she stretched forth her hand to receive the soldier's money; and then turned to the dwarf: "Look here, Jemmy—look at the silver; it'll do your heart good;

sorra morsel of food has passed the poor crathur's lips today. Make haste, and go down to Mikey Brown's and buy somethin'; you'll know how to lay the money out."

The object of her instructions departed. We shall not follow him in the discharge of his commission. It is sufficient to say, that, after about an hour's absence, he returned amply provided, to the satisfaction of himself and mother. Nor is it necessary to tell how the interval of his absence was passed between the latter and her guest. On the reappearance of her son, however, she rose, and began to busy herself in preparing for the approaching meal. In the performance of this duty, she exhibited the full length of her person, which was considerably above the usual female standard, and presented a striking contrast to the diminutive proportions of her elfish-looking offspring. As she stood heaping fresh fuel on the blazing hearth, she might have suggested the idea of a witch engaged in some work of nocturnal incantation, while, to complete the illusion, the dwarf, like an attendant sprite, stood near, waiting with impatience the conclusion of her task. A candle was lighted, and all being at length arranged, the three partook of the repast. This having been finished, the spirits were produced, and the soldier urged to drink. He did so, but very moderately; and soon after, either from fatigue, or an unwillingness to join the intemperance which was evidently to follow, or perhaps from both causes, declared his intention of going to rest. He rose accordingly; the dwarf accompanied him into the other room, and having pointed to the bed, left him, a malicious grin heightening the deformity of the creature's countenance as he did so. The bed consisted merely of a little straw and a few miserable articles of covering. To one, however, who had been accustomed to lie in the open air, with nothing save the damp green grass of the battle-field for his pallet, this was not now a matter of any consideration. He threw himself down, dressed as he was, and tried to compose himself to rest. It was some time before he succeeded; melancholy thoughts possessed his mind. The voices of the wretched beings he had left were audible, though their expressions were not distinguishable—now louder, as if engaged in drunken altercation, and now sinking to a low and barely perceptible murmuring. More than an hour might have thus passed, when at length, worn out with fatigue, mental and bodily, he sunk into a profound sleep.

We may now return to the occupants of the adjoining room. The dwarf had drawn his stool close to that on which his mother sat; the cup was handed from one to the other; and each, in turn, plied the intoxicating draught, all the time maintaining a low conversation, which, it is almost superfluous to say, bore the most horrible import. At length the woman arose, and approached the door of the room in which the soldier lay, to listen if she heard any sounds that might indicate his being awake. All was still. Satisfied of this, she returned to the table, and taking the candle, proceeded to enter the apartment for the purpose of a closer examination. There was little occasion for fear; the object of her scrutiny lay in perfect unconsciousness of the work of treachery which was being plotted against him. There was, it is true, a heavy breathing, and now and then a convulsive sigh, that bespoke the presence of some troubled dream, and caused the hag to tremble. But no more—it passed, and he was again still. It was a moment not to be neglected: she moved stealthily away, and returning to the dwarf, beckoned him to rise.

But it is full time to make the reader acquainted with certain occurrences in another quarter. It will be remembered that Paddy, after parting with the soldier, had pursued his way home, where he arrived without any further incident. It was no small pleasure to him to hear from one of his younger children, who met him on the very threshold of the door, anxious to be the first to announce the news, that his niece Mary, who was expected on the following day from a situation which she had some time occupied, had already arrived—a pleasure which was considerably augmented by the approach of the girl herself, followed by the other members of the family, to meet him. "Throth, and it's yourself that's welcome, my colleen," cried the warm-hearted man, as he extended his broad arms to embrace her.

The girl so welcomed was in every way worthy of the kindness she experienced. In early life deprived of her parents, she had been taken by her uncle and aunt, and reared as their own child. As she grew up to womanhood, her form developed more than ordinary attractions, while her features displayed a regularity and beauty rarely to be equalled. It was not to be supposed that she should escape attentions from the youngsters of the neighbourhood; and, accordingly, at chapel or fair, she was the constant object of their rivalry. This she disregarded, for her affections had been early engaged; her young heart had been bestowed on one who well deserved the gift. William Molan, the son of Peg Marks by her former marriage, was the object of Mary's first and only love. In his many trials, she was a fond consoler—when harassed by the treatment of his unnatural mother, this excellent girl would cheer him with the hope of better days. And at last, when, driven from his paternal roof, and stung with shame for the infamy of his nearest kindred, he enlisted, her voice whispered the last words of comfort in his ear—she spoke of future happiness, and renewed her vows of constancy. Well and faithfully did she keep her word; for though the report of his death had long since arrived, she was still single, and hoping even against hope.

Mary and her friends were now, as may be supposed, happy in each other's society, the interchange of affectionate conversation passing from one to another. Paddy was evidently charged with a secret, the possession of which seemed to give him, in his own eyes at least, considerable importance. It was plain, however, that the subject, whatever it might be, could not long remain in his exclusive keeping; for, like many other persons burdened with a similar trust, he was determined not to allow the superiority which it gave him to be overlooked, and so kept constantly hovering round the forbidden topic, now slightly touching on it, and again checking the volubility which was near betraying him; until at last, all caution forsaking him, the whole broke forth beyond the power of recall.

"Aye, aye," he exclaimed, "there's the whole thruth for you, my colleen—you have it all now; Willie's alive and well, and will be here in the mornin'."

Sudden joy, like sudden sorrow, may be too powerful for the human frame; the extreme of either will produce a like result. Mary heard the announcement: it was too much—her heart throbbed wildly for a moment—her eyes lighted up, and then her vision became confused—she fainted for a few moments, but rallying under the sudden effort, she falteringly inquired—"And did he say nothing of"——

"Of yourself?" interrupted the uncle; "in troth, he did, my jewel; it's your own sweet self that's nearest to his heart; and if he had known you were here, I'll be bound he wouldn't have stopped where he did; he promised to be here in the mornin', for I tould him you'd be over from the castle thin."

Mary's strength now rapidly returned; and she asked eagerly, "But where did he go?"

"Why, you see," returned the other, "the fond heart is in him still; and he longed to see his ould mother, bad as she thrated him; he thought he wouldn't be known—and, in troth, it's not many 'd be able to tell the poor white-faced boy, that left here ten years ago, in the fine cliver fellow that's come home, with a cheek as brown as the hot sun could make it."

"And do you think she won't know him?" asked the girl, anxiously.

"Not she," he replied.

"Nor the other?" she again urged.

"The dwarf, you mane, I suppose?" said her uncle.

"Yes—yes," she exclaimed, in a more troubled tone; "wouldn't he know him?"

"It's thrue enough he might," replied Paddy. "What a fool I was not to think of it before! I'll set off at once," he observed, turning to Mary; "and rest aisy—you'll soon see him safe and well; it 'd be worth goin', late as it is, if it was only to say you were here."

"Oh, yes—yes!" urged Mary; "go, but not by yourself; you must take me with you—I couldn't stay behind."

Alarm completely overcame her bodily weakness; the purpose she had formed seemed to inspire her with strength for its execution. And though earnestly besought to remain, her resolution was unshaken—she could not be dissuaded. A horse and car, therefore, having been got ready, she and her uncle set off, accompanied by his eldest son, a stout lad of about seventeen years of age.

We shall leave them to pursue their way, while we precede them to the cabin of Peg Marks. But the scene which was there enacting by its vile inmates, under the influence of intoxication and the most malignant passions, cannot endure relation. Ere the friendly party arrived, the unfortunate wayfarer was no more. The terrible deed had just been completed, when a noise was heard outside; there was a sound of voices, and then a knocking at the door. The woman started in evident terror; she looked at the dwarf, and then again at the door. "Who can they be, Jemmy?" she asked—"at this time of night, too." He was silent; fear had completely overcome him, and the light fell from his hand. All was darkness: they could not long remain inactive; the knocking became louder, and the claim for admittance more urgent. "Go aisy to your bed, Jemmy," she whispered, "and let me answer them. Where's the candle?" He groped along the bedside, and, having found it, both crept to the outer room. The dwarf threw himself on the settle-bed, which we have already mentioned was that on which he usually slept, while his mother, approaching the door, exclaimed, in an angry tone—

"Who are ye? and what 'd ye be wantin' at such an hour as this?"

"Just a word or two with the soldier that's stoppin' here," answered a voice, which the reader will guess to be Paddy's.

"There's nobody here, honest man," she returned, "but the widdy woman and her poor orphan, that's lyin' sick there in his bed wid pure hunger."

"Oh, don't believe her, uncle!" exclaimed a female voice outside.

"That I won't," replied her good-natured uncle; and, putting his foot against the door, he drove the frail defence in with a loud crash.

The party entered. The old woman had retreated to the further part of the room—a gloomy light from the few burning embers that remained of the fire just rendering her form visible.

"And now," she exclaimed, "that you have got in, what betther are you?"

"Stir up the fire and make a blaze," said Paddy to his son, without attending to her question.

The boy proceeded to obey, and in doing so, found the candle which the dwarf had brought with him from the other room. This he hastened to light. He had scarcely done so, however, when a loud shriek from Mary called the attention of himself and his father. She was unable to utter a word, but stood pointing to the old woman. The cause of her terror was evident. The hag's hands and arms were profusely stained with blood; a large spot or two also marked her face. Cold horror thrilled to the very hearts of the beholders. "They've murdered him! they've murdered him!" at last cried Mary; and, with a strength inspired by the occasion, she rushed to the spot where the murderess stood—"Where is he? where is he?" she cried, in a frantic voice; "show me where you've put him—my own Willie?"

"Eh! who did you say?" asked the woman, earnestly.

"Willie Molan, your own son," answered Mary, in a wilder tone; "tell me where you've put him?"

The wretched mother heard not the latter part of the sentence; the name was enough. The full extent of her crime flashed horribly on her mind: she staggered a few paces back, and fell insensible to the ground.

We will not relate the sad scene that followed, when the body of the soldier was discovered. Poor Mary! that was the last night of earthly peace for her; she survived it, indeed, but the exertions she had made, and the shock she had received, were too much for a delicately constituted frame. She gradually sunk; and, within a year from that time, was at rest for ever. She lies buried by her lover's side, in the little churchyard of ——.

The old woman lay for some hours in a state of insensibility; when she recovered, the officers of justice had arrived. She raved, and horrible were the utterings of her raving; wherever her eyes turned, the vision of her murdered son seemed present. "There! there he is!" she would cry; "I see him now! Oh, spare me! spare me! Sure I didn't know it was himself." Then turning to the officers, she would ask, "Who are you? What 'd you be wantin' wid the widdy woman?" And then, changing her manner, she would cry imploringly, "Oh, take me to jail! *I* did it—*I* killed him; but let Jemmy go—the poor fatherless boy—won't you?" She had just repeated this request, when footsteps were heard approaching the door. She looked towards the spot; the sounds were nearer and nearer still; then two men entered, bearing between them something that resembled a human body. It was now daylight; the woman gazed intensely at their burden, and recognised the dwarf. "Let him go! let him go!" she exclaimed; "I did it! I did it!" Then rising, she approached the men with a beseeching air; but stopping suddenly, as she caught a closer view of the object which they bore, a wild and piercing cry broke from her, and she fell back again into the arms of one of the men who had been left in the cabin to guard her.

It will be necessary to explain, that, in the confusion which took place on the entrance of Paddy and his two companions, the dwarf had managed to escape. He hurried on through the fields, without any attention to the course he followed—fear, acting as a stimulus, drove him blindly forward. His lifeless body was found, by those sent in search of him, at the bottom of a deep gravel hole, into which it is supposed he fell in his flight.

The wretched mother was soon removed to the neighbouring town of ——, where, having been fully committed for the murder, she was shortly after tried and executed; not, however, without having made a full confession of all the circumstances of her crime.

MR SWAIN'S POEMS.

MR CHARLES SWAIN has republished his poems (Tilt and Bogue, London) in that form of typographical elegance and pictorial embellishment, of which Mr Rogers's "Italy" was, we believe, the first exemplar. Externally, of course, the volume is a most beautiful one; in matter, it has great attractions for all who can appreciate the breathings of the spirit of a gifted and amiable man—as the subjoined specimens will in part testify. The principal poem—entitled *The Mind*—though the topic is apt to appear too abstract for most readers, contains much fine poetry, all of which is harmonised by devout feeling. We observe the imprint of this volume to be that of a Manchester firm: if this be as it appears, we must say that the provincial has here come fully up to the finest productions of the metropolitan press.

BOYHOOD.

The dreams of early youth,
How beautiful are they—how full of joy!
When fancy looks like truth,
And life shows not a taint of sin's alloy:

When every heart appears
The temple of high thought and noble deed;
When our most bitter tears
Fall o'er some melancholy page we read.

The summer morn's fresh hours—
Her thousand woodland songs—her glorious hues
Oh! life's so full of flowers,
The difficulty *then* is where to choose!

The wonderful blue sky—
Its cloudy palaces—its gorgeous fanes;
The rainbow tints which lie
Like distant golden seas near purple plains;—

These never shine again,
As once they shone upon our raptured gaze;
The clouds which may remain
Paint *other visions* than in those sweet days!

In hours thus pure—sublime—
Dreams we would make realities: life seems
So changed in after-time,
That we would wish realities were dreams!

LOVE'S REMONSTRANCE.

What! for a word—an idle word!
And more in jest than earnest spoken?
Were I to note each breath I heard,
My heart would soon be changed—or broken!
'Tis not when words are *sweetest* said,
Love's living flower blooms there to meet us;
The flower of love may still be dead,
Although its fragrance seem to greet us!
Then weigh not thou a word so slight,
Nor keep thy gentle bosom grieving;
The tongue that finds things ever right,
Believe me, love, 's a tongue deceiving.

Oh, if my heart had sought thee less,
Mine eyes loved less to wander round thee,
That word of wounded tenderness—
That hasty word—had never found thee.
The *dew* that seeks the sun's fond gaze,
His golden lips in gladness beaming,
Meets death within his smiling rays—
His gilded fondness is but *seeming!*
Then weigh not thou a word so slight,
Nor keep thy gentle bosom grieving;
The tongue that finds things ever right,
Believe me, love, 's a tongue deceiving.

CONSOLATIONS.

THE ills of life being so numerous and so besetting, it is a matter of great consequence to have a ready access to the magazine of consolations, and be able to apply these to our sores with dispatch and effect. I have long been a careful student of this branch of the economy of life, and therefore believe that I may be able to give some good hints upon the subject. It is, in the first place, above all things necessary to have all the proper consolations at one's finger ends, so that we may never be caught in a mischief that we cannot be readily reconciled to. For this reason, in the present paper, I adopt the plan of putting the various available consolations into an arrangement of almost dictionary-like perspicuity.

That others are as unfortunate as myself. This may be described as one of the cardinal consolations of humanity. It occurs with a facility which may almost entitle it to rank amongst those ideas which philosophers call instinctive. And it has this remarkable quality as a consolation, that, where the circumstances are such as to make it tolerably applicable, it precludes the necessity for all others. I well remember how powerfully it acted at school, when, being myself well thrashed, I had the satisfaction of looking along a whole row of companions, all of them under a perfect parity of cutaneous sensation. Whether it was that the evil, by being participated, was diminished, or that some mysterious sympathy came to soothe us in our distresses, I cannot tell. But of the comfort of having six or eight companions in misfortune there can be no doubt. Just so, when one has the misfortune, in mature life, to get into the Gazette, it is quite restorative to see a good long list of other poor fellows, beginning with the A's and ending with the Y's—or the Z's, if there are any—amidst which one's name takes only its own modest place, according to the situation of its initial in the alphabet. It is the same when one catches any unfortunate ailment, and is laid up by it. Sickness is relieved, pain assuaged, and languor inspirited, when we hear how many other people have taken the same complaint. And, to do mankind justice, there is a great disposition in one's friends to help one to such consolations. At least I can say for my own part, that I never took any ailment, even of the most out-of-the-way kind, not excepting some that I never had before heard of, but I was immediately informed by friends of numberless other people who were then lying ill of the very same malady. People know how agreeable it would be to themselves, were they unwell, to hear of others being similarly afflicted; and they accordingly proffer these consolations with a perfect assurance of their being attended with a good effect. I am not sure but it might be worth the faculty's while to consider how far such intelligence has a medicable property, and to administer it accordingly, in proper doses, as suited the necessities of the case.

If I don't get it nobody else gets it. This is a consolation very much akin to the former, and is calculated to be exceedingly efficacious in cases of disappointment. Like its amiable predecessor, it usually makes its first appearance in our early days. When the whole children of a family are clamouring for some delicacy or treat, or the exclusive possession of some toy or picture-book, decidedly the next thing to getting it one's self is hearing mamma declare that she will give it to none. This looks fair; it does not leave any one a word to say. So, in mature life, when a number of gentlemen are candidates for a particular post, it is really refreshing to the weary souls of those who have lost hope, when they learn that the office is to be suppressed. All must have experienced satisfactions of this kind. Suppose one is not getting on well at the bar, how gratifying at least to know that a hundred other men, quite as good as we, are just as much in lack of practice! Or, suppose a shopkeeper not getting above half the custom he would like to have, how thoroughly it calms his mind to know that not one person in the same line, in the whole street, is getting any more than himself! Despondency in such circumstances is entirely out of the question. There is not a more jocund set of men breathing than those very young barristers who get no business. And this just because no one of their set does any better than the rest. This consolation is therefore to be regarded in the additional character of a promoter of good fellowship and good humour. It keeps men sweet under circumstances which would otherwise be trying to the temper. There would be no such thing as envy in the world, if this excellent species of consolation were more generally applicable.

The thing was not worth having. This is another consolation appropriate to cases of disappointment. History informs us that, in very remote times, a certain fox one day made an attempt to get possession of certain grapes hanging a little beyond his reach, when finding it all in vain, he sagely remarked, that, the grapes being of an unusually acid kind, he was quite as well without them. Though this is the first instance on record of such an observation being made, we cannot doubt that, long before the times of this celebrated fox, men were accustomed to take their disappointments in a similar philosophical spirit. It is to be remarked of this consolation, that it naturally occurs only when the preceding one fails. We first would like to see no one else get it any more than ourselves; but, if destiny so wills that some other person does get it, then we instinctively resort to the consideration that the thing was not worth having. Some writers might be of opinion that, coming thus as a *dernier resort*, it is rather a shabby kind of consolation; but I, for one, cannot see the thing in that light, it appearing to me to be quite as legitimate to take up with one consolation after another fails, as it is for mariners in distress to leave their ship and take to the boat or a raft. Men must be guided in these matters by considerations of expediency alone, and not be deterred from using good and valid consolations by any absurdly piquish notions as to the relations in which they stand to each other. Let it at the same time be understood, that the former consolation is the preferable one, *if it can be had;* but perhaps this is a point on which there is no need for enlarging. The fox himself would have seen the gradation of the two ideas, and never would have thought of calling the character of the grapes in question, if he could have believed that they grew beyond the reach of men as well as foxes.

I am rather glad I did not get it. This is a modification of the above consolation, so slight as scarcely to be entitled to a separate place. Yet it is a very good and available consolation too. As the above proceeds upon an assumption of the worthlessness of the thing sought for, so does this upon an assumption of its being positively disadvantageous. It answers particularly well for a gentleman who has been jilted, the act of jilting affording in itself a sort of presumption that the lady was of a character not calculated to make her lover happy as a husband. Gentlemen may also apply it with advantage, when balked in their application for an office. They have only to satisfy themselves that the duties were irksome, paltry, or something else, and that the emoluments would have been under what they are realising by their profession. The only puzzling thing about the use of this consolation is that regard for consistency which all men are required to have. The jilted gentleman, for instance, may have been pursuing the object with the greatest eagerness, in the eyes of all the world, up to the moment when, unexpectedly, it has eluded his grasp. This is, of course, rather awkward. People may think that he would have gladly had the lady if he could. Yet such things can be got over. A little plausibility will go a great way to make the notion appear feasible, and the courtesy of society, or their indifference to the minutiæ of your affairs, will do the rest. There is, however, a superior plan of passing off the affair favourably to one's self. It takes a form of words such as, either, *Oh, I changed my own mind*, or, *I saw how things were likely to turn out, and gave up in time.* This, being a mere afterthought, designed to deceive others, is of course no consolation to one's self for the actual disappointment. But is it not a great matter at least to make others think that we have not been disappointed?

There are various forms of consolation for failure in securing applause, being the subject of evil-speaking, falling victim to popular delusions, unjust power, and so forth, which a judicious person will take care to be constantly provided with. A poet with three readers knows that he is at least admired by the sage few (the wise have always been a small number), and that posterity will do him justice. A defeated candidate on a parliamentary election may assure himself that he had all the independent voters on his side, and that it was only the overpowering force of corruption which carried the day against him. A gentleman, hearing he has been spoken of in very injurious and depreciatory terms by some person, probably heretofore supposed a friend, has it in his power to jump in a moment to a conviction that the ill-will of such a fellow is rather an honour, and that it only would be painful to be the subject of his praise. A philosopher whose views go a great way ahead of his age, and subject him to ridicule and calumny, the effect of which is to mar his fortune and make him universally shunned—what a glorious consolation he has in the reflection, that about five hundred years hence, mankind will be generally of his mind, and disposed to honour him as one of the greatest geniuses that ever lived! So also when the indiscreet patriot is condemned to exile, the galleys, or death, how more than consolatory must it be for him to know, that in the sentiments of a future generation, the decree will be reversed, and probably a pen drawn through his name in the record of the criminal court before which he now stands, without a single pitying eye around him. As for the young soldier who dies in the field of battle,

> "His king and his country to save,"

we have the authority of all the great lyrists from Tyrtæus to Burns, that it is a positive advantage, when compared with the natural close of the long dull life of a common citizen:

> "When victory shines on life's last ebbing sands,
> Oh, who would not die with the brave!"

He is cut short, it is true, in his career, at a time when he rather enjoyed life; but then his *name*—will not it be inscribed in the proud rolls of fame, where it will live for ever? Even the sad case of a flag-of-truce, seized by a barbarous enemy and hanged as a spy, in contempt of all the rules of international law—he may at least take comfort in the assurance that his death will be amply revenged. This view was strongly put by the most noble Marquis of Montrose, in conversation with Captain Dugald Dalgetty, when it was

thought necessary that that gentleman should proceed on a mission to the great Argyle. When other persons in the royalist army declined the service, on account of the local situation of their estates with regard to that of Argyle, Montrose, we are told, "resolved to impose the danger and dignity upon Captain Dalgetty, who had neither clan nor estate in the Highlands upon which the wrath of Argyle could wreak itself. 'But I have a neck though,' said Dalgetty, bluntly; 'and what if he chooses to avenge himself upon that? I have known a case where an honourable ambassador has been hanged as a spy before now. Neither did the Romans use ambassadors much more mercifully at the siege of Capua, although I read that they only cut off their hands and noses, and suffered them to depart in peace.' 'By my honour, Captain Dalgetty,' returned Montrose, 'should the marquis, contrary to the rules of war, dare to practise any atrocity against you, *you may depend upon my taking such signal vengeance that all Scotland shall ring of it!*'" "That will do little for Dalgetty!" I grieve to say, was the answer of the proposed ambassador—an answer which can only be attributed to the corruption wrought in his nature by his long services as a mercenary soldier. A true hero would have been at once satisfied with the promise of such plenary vengeance as Montrose held out. Yet, we are bound to record, in honour of the captain, that, after all, he did undertake the office, and only escaped the consequences which he apprehended by a very narrow chance.

There are various tastes in consolations, as in most other things. Some take to one, some to another, quite naturally, just as the bent of their minds inclines them. "Others as ill off as myself"—"Nobody else gets it any more than I"—these have charms for a particular class of persons inspired by a strong sense of justice, which makes it appear odious that good and bad fortune should be distributed in a partial manner, to their disadvantage. "The thing was not worth having"—and, "I am rather glad I did not get it," are favourites with a class who have a remarkable power of forgetting their own recent wishes, and a singular knack of practising happy deceptions upon themselves. "I have all the sensible people on my side"—"Posterity will do me justice"—"I at least secure immortality"—and, "The rascals will smart for this yet," these are suitable to persons possessed of a strong power of abstraction, which makes the present seem nothing. There is another set of philosophers who delight in such as—"Well, I know it can't be helped"—"It is just my unlucky destiny"—and, "It will be all the same a hundred years hence." This is a peculiarly happy school. So little are they affected by the turns of Dame Fortune, that my only wonder is she continues to give herself the trouble of trying to annoy them.

There is, lastly, a form of consolation to which I must own I have myself a great attachment, conceiving that it rests upon somewhat larger views of man's position on earth than any of the rest. It consists in a firm reliance on the general good arrangements of a wise and benevolent Providence, which makes evil only an exception from present and apparent good, and often turns even evil to account for what may be called a deferred benefit. Knowing this to be the character of the arrangement of mundane affairs, and that life and all its blessings are held under an obligation to submit to that arrangement, I humbly endeavour to meet the troubles that befall me with composure and resignation. Evils I admit them to be: I see no good in seeking to extenuate them, or in looking complacently to the equal or greater woes of others. But, while the Great Arrangement obviously does not exclude evil, it as evidently comprises a gift to man of the power of bearing it in a rational and proper manner, and also certain moral medicaments of unfailing virtue. One of these is of a nature the very opposite to some of those above described, for it consists in the sympathy of friendly and unselfish natures—those Good Samaritans of the common world, who know not what it is to see suffering without wishing to relieve it—who would at all times pity rather than blame—and who, like surgeons attending a duel, may almost be said to watch for the occurrence of evil, that they may be instant in their endeavours to remedy it. Another is to be found in a firm unflinching spirit of submission—not the dogged teeth-clenched stubbornness of the Stoic, but the patience and meekness of a better philosophy. There is much, too, in the power of our old friend Time. A new day brings round new experiences and new feelings to obliterate the old. Finally, there is the knowledge of a chastening and improving effect from well-borne afflictions. In these considerations, and a few others less of a this-world kind, I respectfully submit that the *best*, because the *truest and least selfish*, consolations are to be found.

CUBA.

This great and opulent Spanish island is approaching a crisis, from the following circumstances:—Notwithstanding the treaty agreed to between the British and Spanish governments for the suppression of the slave-trade, and notwithstanding the orders successively dispatched by the cabinet at Madrid to the captains-general in Cuba, that colony continues to be the great shipping station of the West Indies for carrying on the infamous traffic with Africa; the captain-general denying all knowledge of this state of things, and, as every interested person in Portugal, Cuba, and Brazil is well aware, receiving all the while a capitation-present of about L.20,000 a-year for not seeing that which takes place right under his excellency's nose. Urged by the abolitionists on all sides, the British government is now insisting that the government of Spain shall carry out the treaty of 1835, by the simple plan of preventing any ship prepared for the slave-trade from quitting Cuba; while the British cruisers would prevent any vessel from arriving with a slave cargo. The government of Spain promises to do this: Cuba threatens that if this be attempted, she will either ally herself to the States of America, to which she would prove an invaluable accession, or that she will declare herself an independent country, which it is apprehended the government of Madrid would not be strong enough to prevent. In the mean time, many of the resident colonists are desirous to see the present infamous system broken up; and the slaves themselves, who far outnumber all the rest of the inhabitants, are acquiring dark intelligence of what has been done for their brethren in the neighbouring English islands, and thereupon are interchanging knowledge of power, and sentiments of unanimity and determination, that, though yet unspoken, are already causing the white tyrants to tremble in their sleep. Thus the entire society of Cuba is in a state of painful agitation. Without attempting to predict what may be the issue of this state of affairs, we think the present an opportune moment to inform the reader of the actual state of the slave-trade and of slavery in Cuba, principally availing ourselves of a very interesting work, entitled "Travels in the West, by David Turnbull, Esq.," recently published.

"As if to throw ridicule on the grave denials of all knowledge of the slave-trade, which are forced from successive captains-general by the unwearied denunciations of the British authorities, two extensive depôts for the reception and sale of newly imported Africans have lately been erected at the end of the Paseo or military road, constructed under the former governor-general Tacon, and just under the windows of his present excellency's residence; the one capable of containing 1000, the other 1500 negroes: and I may add, that these were constantly full during the greater part of the time (the close of 1838) that I remained at the Havanna. As the depôts serve the purpose of a market-place as well as of a prison, they have, doubtless for the sake of readier access, and to save the expense of advertising in the journals, been placed at the point of greatest attraction, where the Paseo ends, where the grounds of the captain-general begin, and where passes the new railroad into the interior, from the carriages on which the passengers are horrified at the unearthly shouts of the thoughtless inmates, who, in their eagerness and astonishment at the passing train, push their arms and legs through the bars of their windows, with the cries, the grimace, and gesticulation, which might be expected from a horde of savages placed in circumstances to them so totally new and extraordinary. Those *barracoons*, or depôts, appear to be considered by the foreign residents as the lions of the place. On the arrival of strangers, they are carried there as to a sight which could not be well seen elsewhere. A barracoon was one of the first objects the Prince de Joinville was taken to see on his first visit to the Havanna. On entering one of the barracoons, which are, of course, as accessible as any other market-place, you do not find so much immediate misery as an unreflecting visiter might expect. It is the policy of the importer to restore, as soon as possible, among the survivors, the strength that has been wasted, and the health that has been lost, during the horrors of the middle passage. It is his interest, also, to keep up the spirits of his victims, that they may the sooner become marketable, and prevent their sinking under that fatal home-sickness, which carries off so many during the first months of their captivity. With this view, during their stay in the barracoon, they are well fed, sufficiently clothed, very tolerably lodged; they are even allowed the luxury of tobacco, and are encouraged to amuse themselves, for the sake of exercise and health, in the spacious inner court of the building. I have been assured, also, that after leaving the barracoon, and arriving at the scene of their future toils, the overseer or *mayoral* finds it for the interest of his master to treat them for several months with a considerable degree of lenity, scarcely allowing them, if possible, to hear the crack of the whip, and breaking them in by slow degrees to the hours and the weight of labour, which are destined to break them down long before the period that nature has prescribed. The inmates of these sad receptacles, from their age, demeanour, and appearance, convey to the visiter a lively idea of the well-organised system of kidnapping to which the trade has been reduced, in order to make provision in the interior of Africa for the supply of the factories and slave-markets on the coast. The well-understood difficulty of breaking in men and women of mature age to the labours of the field, has produced a demand at the barracoons for younger victims, so that it is not, as formerly, by going to war, but by the meaner crimes of kidnapping and theft, and the still baser relaxation of social ties and family relations, that these human bazaars are supplied. The range of years in the age of captives, appears to extend from twelve to eighteen, and as the demand for males is much greater than for females, the proportion between the sexes is nearly three to one—I had almost said *in favour* of the masculine gender. In fact, this is very nearly the relative proportion between the sexes in most of the estates throughout the island. The facilities still left for the practice of the slave-trade, and the consequent cheapness of young Bozal, or native Africans, at the barracoons, make it more for the interest of the planter to keep up the numbers of his gang by purchase than by encouraging marriages."

We have next some extraordinary particulars of the mixed commission at the Havanna, of which the chief duty is to adjudicate on the claims of her Majesty's cruisers for the condemnation of the prizes they have captured, in consequence of their infraction of the existing treaties between Spain and Great Britain on the subject of the slave-trade. In the whole framework of this commission, and in the principles on which it is constituted, there is something exceedingly farcical. The tribunal consists of a commissary judge, and an arbitrator for each nation. Those representing Spain are the Conde de Fernandina and Don Juan de Montalvo y O'Farrel, both noblemen of high rank. The English commissary judge is Mr Kennedy, a gentleman who will long be remembered as the only member sent by an English constituency to the British House of Commons, who divided with Mr O'Connell in his celebrated motion for the repeal of the Union. "In the first instance, the two commissary judges hear the evidence adduced by the commander of the British cruiser in support of the claim of condemnation, together with the exculpatory proof of the captain or owner of the prize; but, as might be expected from the materials of which the court is composed, the commissary judges are very rarely agreed in opinion as to the judgment which ought to be pronounced; so that it becomes necessary, almost invariably, to call in one of the arbitrators to settle the difference in the capacity of umpire. To admit the intervention of both would lead to no practical result, as it has been found that the Spanish arbitrator adopts the views of the Spanish commissary with the most edifying uniformity; and the English functionaries are compelled, in self-defence, to follow the example. In this state of things, as often as the court is divided in opinion, since it is by no means a matter of indifference on which of the arbitrators the powers of an umpire shall devolve, the ingenious expedient has been resorted to, of appealing for the choice to a power which, according to the ancient mythology, has one quality in common with justice, that of being blind. The *dice-box is produced; the learned judges draw for the short straw;* or Dame Fortune is appealed to, by some other form of lottery, to determine which shall arbitrate—the Spaniard or the Englishman—between their dissident chiefs; so that it may be fairly said at the Havanna, and perhaps also at the other courts of Rio de Janeiro, Surinam, and Sierra Leone, that the condemnation of a slaver depends not nearly so much on fact, on law, or the merits of the case, as on the doctrine of chances!"

Under the treaty of 1835, vessels carrying the Spanish flag are, when *equipped* for the slave-trade, and proved to be so—which is not difficult, from the unique character of the fittings-up required for this purpose—as liable to capture by our cruisers as if they had slaves on board. Though Mr Buxton and other warm abolitionists were not satisfied with this treaty, Mr Turnbull assures us that, under its operation in 1839, the Spanish flag, as the banner of slave-ships, had already disappeared from the ocean. The Portuguese flag was next resorted to; but that protection is already beginning to be distrusted by slave speculators and captains, as the power given to our cruisers under a recent act of Parliament, embodying the terms to which Portugal had acceded, on receiving an indemnity of L.6,000,000 from England, is almost as effective against vessels using the flag and papers of that nation as in the case of ships professing to belong to Spain. The great shield of the slave-ships now is the flag of the United States. We are told that the refusal of the Americans to sanction a mutual right of search, will make it safer for a slaver to sail under their flag than under that of any of the governments—Spain, Portugal, or the Brazils—most deeply implicated in the crime. Our authorities at Sierra Leone say, that in a short time the American flag will

be the only one flying over the decks of the slave-ship. A famous American ship, built in the very first style of symmetry at Baltimore in 1838, of 460 tons burden, sometimes called the *Venus*, sometimes the *Duchess of Braganza*, but known beyond all question as a slaver, was visited on the coast of Africa by the officers of a British cruiser, who inquired what they were doing there. She showed her American colours, and answered that they were Americans; and that, as for the English, it was no business of theirs. It was matter of notoriety at the Havanna, that the *Venus* had landed two cargoes of slaves on the coast of Cuba. Mr Trist, the American consul at the Havanna, was informed of these facts, and reminded of the degree to which his government was pledged, with the other Christian powers, to suppress the slave-trade. Mr Trist treated the application of the English authorities as an insult on his government, and in a haughty tone declared, that "he would not recognise the right of any agent of any foreign government to interfere in any possible mode or degree in the discharge of his duties, or forbear repelling such interference if offered." This high tone was very much praised at home. Mr Trist, it must not, however, be forgotten, repudiated the interference of the British authorities very much on the ground that the part acting by our nation was but cant and hypocrisy. He declared that British fabrics were made expressly for the coast of Africa, and that great numbers of casks of shackles, of British manufacture, which could easily be traced to the houses from which they came, were every year imported into Cuba. "I have seen," says Mr Trist, "some of these casks passing through the custom-house here, without attracting any more notice from either officers or bystanders than so many boxes of Dutch cheese." We are afraid there is much melancholy truth in this assertion. Soon after this event, it was proved that the partners of the notorious Forcade, of the *Le Havre* slaver, were Englishmen, and that his house had been established by English capital! In short, there is no doubt of the fact, that, amongst the capitalists of London, there are at this moment several English PIRATES.

Our author, in the course of much valuable information, suggests, that while we are waiting to see what can be done with America, another great step towards the suppression of the slave-trade at the Havanna would be effected, if Spain could be prevailed upon to agree to a clause declaring that every Bozal—a newly imported African, whose appearance at once demonstrates the fact—should be declared free; for, under the present treaty, if the slaves can be once *landed*, they may be seized by the consignees without farther interruption. In his opinion, also, the prevention would be more effective if our cruisers were ordered to confine themselves especially to the west coast of Africa, whence all the slaves must come; and if our captains and crews were stimulated by the rewards of head-money and tonnage-money, the work would be more eagerly done. Mr Turnbull differs from the prevailing opinion, in stating that the majority of the native planters of Cuba are desirous that the slave importation should cease, but that the mother country wishes it to continue, as thereby, the fear of an insurrection of the slaves continually hanging over the masters, these would be more likely to preserve their reluctant allegiance to Spain. Amongst the motives actuating the former, are the admitted facts that one freeman will do as much work as any two slaves; and that all the labours of the plantation and of the manufactory might be as safely, and much more effectually, performed by white labourers, as has long been the case in the neighbouring island of Porto Rico. Cuba contains a large number of white peasants, robust and hardy; but it appears that as many as might be wanted could be obtained from the Canaries. The out-of-door part of the question is already admitted to be in favour of the endurance and power of the white man. Respecting the other part, Mr Turnbull says—"It is a very natural mistake that a Negro can support better than a white man a high artificial as well as a high natural temperature. The reverse has been completely demonstrated on board the British government steamers on duty within the tropics, where it has been proved that an African constitution is not so well suited as that of an European to withstand the heat of the furnace, or rather the frequent alternations of heat and cold, to which the stoker of a steam-boat, and the fireman and boilerman of a sugar-house, are equally exposed." Thus, it appears, the suppression of the slave-trade and slavery at this great emporium, is a question of a very mingled character, but which time will soon decide one way or another. At present, Cuba is a most prosperous colony: the population is nearly 1,000,000, more than half of which are coloured; but the island has surface enough to maintain several millions in plenty. Havanna is one of the finest harbours in the world. In a church in the town rest the bones of the great Christopher Columbus; his memory is held in solemn honour, the building being closed the whole year, except on his anniversary. There are valuable coal and copper mines in the island, but the want of roads is so great, that much of the worth of the minerals is lost in the expense and difficulty of a few miles' carriage. The citizens of the Havanna have found it cheaper to import coal from Liverpool, across 4000 miles of ocean, than to fetch it on horseback from their own excellent mine, only ten miles off! However, the spirit of enterprise is arousing the Spaniards of Cuba as well as those of the Peninsula. American speculators have been calculating amongst the creoles, and already forty-five miles of railway stretch from the metropolis into the interior. The Havanna was taken by the English in 1762, after a hard siege; but at the subsequent peace it was given up. Its fortifications have been since much strengthened; but the Americans say that England is determined to have Cuba, by hook or by crook, on the first decent opportunity; "and, therefore," said a late orator in Congress, "we shall begin the war with England by taking possession of Cuba!" But there is no end to speculations on the fate of this valuable island; so, in winding up our paper, we refer the reader interested in the politics of the Carribean Sea to Mr Turnbull's very entertaining work, and, in short, to those publications which make colonies and slavery their chief subjects.

THE LEGACY.

A TALE OF REAL LIFE.

IT would not have been easy—we could almost say impossible—to have found any where a more contented or a happier family than that of David Hunter, at the period when we first take up their history. Yet the Hunters were in but humble circumstances, the father and three sons being merely common workmen in a large bleaching manufactory, at very moderate wages. But what of that? They were contented, and that was enough.

David Hunter, the head of the family, was a truly respectable man for his station in life—quiet, sober, honest, and intelligent. His sons were not behind him in any of these particulars. They, too, were quiet, well-behaved lads. The family consisted, altogether, of a wife, the three sons just alluded to, and two daughters—the latter, like all the rest of the family, being remarkable for their industrious habits and the general propriety of their conduct.

But it was the love that the several members of this happy family bore to each other that formed the most remarkable feature of their communion, and which most particularly attracted the notice and excited the admiration of all who had an opportunity of marking it. And such opportunity had the whole parish in which they resided; for, in going to church, they invariably all went together, brother and sister linked arm in arm, and all talking so kindly, and looking so fondly in each other's faces—it was delightful to see them.

In church, too, it was a pretty sight to see how attentive the brothers were to their mother and sisters in pointing out the text and the psalm. These were trifling matters, indeed, but people of discernment saw a great deal in them. At home, too, it was equally pleasant to see the Hunters of an evening, after the father and the young men had returned from their work—the house clean and neat; the daughters busily employed in sewing; the mother in discharging her household duties; the father seated by the fire in his great wooden arm-chair, and the sons seated around him, engaged in lively and cheerful conversation. Great, indeed, though humble, was the happiness of the Hunters.

Their employer, who had a great esteem for David and his family, was in the habit of looking in upon them sometimes, after work hours, when making his usual rounds to see that all was right about the field. On these occasions, he never could refrain from saying something congratulatory to David, in reference to the quiet, cheerful, and affectionate conduct of his children. He had witnessed the domestic felicity of the family often; but every time he saw it, it struck him as forcibly as the first time.

"It would be no small matter, David," he said on one of these occasions, smiling as he spoke, "that would cause a difference in your family. I hardly think any thing could interrupt the harmony that reigns amongst you."

"Well, I believe," replied David, with a very excusable look of complacency, "that hardly any thing possibly could. There has never been the slightest difference amongst us yet, and I trust there never will." The sons and daughters replied to their employer's remark by raising their heads, and glancing at him with a smile which said as plainly as smile can say any thing—"A difference between us! No, no; such a thing can never be. We love each other too well and too sincerely for that."

Thus stood matters, then, with David Hunter and his family, and thus they remained for several years, with little or no change; only that David and his wife were getting a little older, and their sons and daughters farther on in life. But in their happiness and attachment to each other there was no change, unless an increase of such happiness and attachment can be so called.

David Hunter and his family were surprised one evening by a visit from the letter-carrier. He had not been at their house for two years before; and then it was with a very primitive-looking epistle, most abominably folded, sealed with a bit of resin instead of wax, and superscribed with a vile hieroglyphical sort of direction. It was from a very honest, decent man, however, a brother of David Hunter, who was a weaver in Bridgeton near Glasgow. No letter had they received from any quarter since then till now. But the letter that made its appearance now was of a very different description, being properly folded, carefully sealed, and altogether business-like. On its being handed in, David slowly put his hand into his capacious waistcoat pocket in search of his spectacles. These found and drawn forth, he deliberately opened them, and with equal deliberation placed them on his nose. All these preparatory proceedings gone through with due solemnity, David at length opened the mysterious letter, and, surrounded by his wondering and anxious but profoundly silent family, read as follows:—

"*London*, —— ——.

Sir,—We have much pleasure in informing you that you are named in the will of the late John Pitt, Esq. of Woodvale, Jamaica, for a legacy of L.5000.

We, in the mean time, merely advise you of the circumstance; but shall in a day or two address you again, with instructions as to proceedings necessary for putting you in possession of said legacy, also as to time and manner of payment. We are, sir, your obedient servants, GRESSEY AND GREGSON, *Solicitors*."

It is presumed to be unnecessary to describe the effect this extraordinary and most unexpected communication had upon David Hunter and his family. The reader will himself form a sufficiently lively idea of it, without our troubling him with a description. The legacy had been wholly unlooked for; the testator being a very distant relation, and a person with whom David had never had any correspondence, indeed, of whose existence he was hardly aware.

The news of the Hunters' legacy, notwithstanding the precautions taken by the family to keep the matter quiet for a little time, soon spread amongst the neighbours, who said that David's family, happy before, would surely now be ten times happier. It was reasonable to think so; for, if they were content and happy with very limited means, they would certainly be much more content and happy when these means became abundant. It was reasonable that it should be so—that on becoming richer they should become happier. Did it? We shall see.

In the course of a few days, David heard again from the London solicitors, who now wrote fully on the subject of the legacy, and gave him such instructions as put him in possession of the money in less than three months after. For some time subsequent to this event, no change whatever was observable in the family. Neither pride nor ostentation followed their good fortune. On the third or fourth Sunday, however, the neighbours and others who knew of and had observed their affectionate manner towards each other, were a good deal surprised at the unusual order in which they came to church. Formerly, as already noticed, they used to come in the most loving manner, arm in arm together; now they came in a string, all separate and wide asunder. There was observable, moreover, more or less of an angry and discontented expression on the countenances of all of them, which, contrasting so very strikingly as it did with their former cheerful looks, was very conspicuous, and attracted the notice of the more shrewd observers. Coming to church in this manner, they of course entered their pew in a straggling way, one after the other, at considerable intervals, and not together as formerly—another circumstance, indicative of some change of feeling, which did not escape the notice of the congregation; the report of their sudden acquisition of wealth having rendered them objects of special attention for a time. Neither did a total neglect of those little acts of courtesy to each other in church, of which we formerly spoke, elude the observation of those around them.

People were much surprised at this unusual deportment on the part of the Hunters, and wondered if any disagreement had sprung up among them, and if so, whether the legacy could have any thing to do with it. They said it would be strange if good fortune could do that which bad fortune had been unable to do—namely, destroy the happiness of the family; in this remark, alluding to a period when the Hunters had been in great distress from want of employment and illness together—trials which seemed only to increase their attachment to each other; while now it appeared to be precisely the reverse. But had any change really taken place in their feelings towards each other? By retrograding a little in their history we may ascertain this.

On the third day after the receipt of the legacy, David Hunter called his family around him, and told them that he wished to inform them of certain arrangements regarding the distribution of the legacy amongst them (including a provision for himself and wife), on which he had determined. He then proceeded to name to his sons the respective sums which he intended giving them to begin business with, and to his daughters the sum he intended giving them as dowry in the event of their marriage. Having concluded, David looked around for the approbation which he felt conscious he deserved. But what was his surprise and mortification when he perceived in every countenance the most unequivocal signs of disappointment and discontent! There was not one of his children, sons or daughters, pleased with their allotted portions.

Poor David endeavoured to meet their views by altering, modifying, and even by offering to increase the different sums by reducing the moderate proportion he intended retaining for himself; but to no purpose. No arrangement or distribution he could propose or suggest would satisfy the expectations or wishes of his children. They did not, indeed, complain

openly, much less by either loud or angry expressions; but there was gloom on every brow—sullenness and discontent on every countenance.

From this moment there was no longer any happiness in David Hunter's family. A feeling of jealousy and dislike was now engendered, which could never again be eradicated. Poor David saw and bitterly felt the change, and wished a thousand times that the legacy had gone to the bottom of the sea instead of coming to him, as he deemed it but a poor substitute for the domestic felicity he had lost. Here will be found a sufficient explanation of that difference of deportment which had attracted the notice of their neighbours.

David Hunter, seeing that there was no hope of restoring harmony amongst his children, who were now snapping and snarling at each other, morning, noon, and night, determined, however painful to his feelings it might be, to break up his family. In pursuance of this resolution, he recommended to each of his sons to betake himself to lodgings of his own, and to start in the world on his own account. To enable them to do so, he said, he would instantly pay them down the different sums he had determined on giving them respectively. His sons, though far from satisfied, sulkily acquiesced in the proposed arrangement; and, in a few days after, left their father's house, but in such sullen mood, that they would not tell him either where they were going or what they intended doing.

They never held any correspondence again. Each brother, thinking the others had got more than they ought to have done, and, of course, he himself less, never went near each other, but, on the contrary, continued to the end of their lives to entertain a feeling of the most bitter hostility to one another. Neither did any of them ever again visit their father, whom they all agreed in accusing of unjust dealing towards them.

Such was the consequence of the legacy; and it may be taken as another evidence of the well-known truth, that an accession of wealth is not necessarily, by any means, an accession of happiness.

ENGLISH POPULAR FESTIVALS.

We propose giving in the present volume of the Journal notices of the principal festivals or holidays observed generally by the English people, each notice being introduced into the number published most nearly to the time of the particular holiday in that case referred to. We shall thus have an opportunity of adverting to many curious old customs of the people, and many not less curious old notions of the popular mind, now alike rapidly fading and going into oblivion. We start with

CANDLEMAS DAY.

Candlemas day, a holiday of the Church of England, and the festival of the Purification of the Virgin in the Church of Rome, occurs on the 2d of February. It is observed with great pomp throughout the Catholic world. The name is derived from the ceremony which the Church of Rome dictates to be observed on this day, namely, a blessing of candles by the clergy, and a distribution of them amongst the people, by whom they are afterwards carried lighted in solemn procession. The more important observances were of course given up in England at the Reformation; but it was still, about the close of the eighteenth century, customary in some places to light up churches with candles on this day.

In an ancient English book of monastic rules, it is directed that, on the Purification of the Virgin Mary, the monks "shall go in surplices to church for candles, which shall be consecrated, sprinkled with holy water, and censed by the abbot. Let every monk take a candle from the sacrist, and light it. Let a procession be made, thirds and mass be celebrated, and the candles, after the offering, be offered to the priest."* Old English Catholic prayer-books give the service used on this occasion. The candles being brought to the altar, the priest says over them several prayers, one of which commences thus:—"O Lord Jesu Christ, who enlightenest every one that cometh into the world, pour out thy benediction upon these candles, and sanctifie them with the light of thy grace," &c. Another begins: "Holy Lord, Father Almighty, Everlasting God, who hast created all things out of nothing, and by the labour of bees caused this liquor to come to the perfection of a wax candle; we humbly beseech thee that, by the invocation of thy most holy name, and by the intercession of the blessed Virgin, ever a virgin, whose festivals are this day devoutly celebrated, and by the prayers of all thy saints, thou wouldst vouchsafe to bless and sanctifie these candles," &c. Then the priest sprinkles the candles thrice with holy water, saying "Sprinkle me with," &c., and perfumes them thrice with incense. Some consecratory prayers are then said, as—"I bless thee, O wax, in the name of the Holy Trinity, that thou mayest be in every place the ejection of Satan and the subversion of all his companions," &c. During the saying of these prayers, there are various bowings and crossings; and when the consecration is over, the candles are distributed by the priest to the people, each kneeling, and each kissing the candle as he receives it, and then the hand of the priest who delivers it; the choir meanwhile singing—"A light to lighten the Gentiles, and the glory of thy people Israel!" After the distribution, a solemn procession is made, in which one carries the censor, another a crucifix, and the rest burning candles in their hands.*

At Rome, the Pope every year officiates at this festival in the beautiful chapel of the Quirinal. When he has blessed the candles, he distributes them with his own hand amongst those in the church, each of whom, going singly up to him, kneels to receive it. The cardinals go first; then follow the bishops, canons, priors, abbots, priests, &c., down to the sacristans and meanest officers of the church. According to Lady Morgan, who witnessed the ceremony in 1820—"When the last of these has gotten his candle, the poor *conservatori*, the representatives of the Roman senate and people, receive theirs. This ceremony over, the candles are lighted, the Pope is mounted in his chair and carried in procession, with hymns chanting, round the ante-chapel; the throne is stripped of its splendid hangings; the Pope and cardinals take off their gold and crimson dresses, put on their usual robes, and the usual mass of the morning is sung." Lady Morgan mentions that similar ceremonies take place in all the parish churches of Rome on this day.

It appears that in England, in Catholic times, a meaning was attached to the size of the candles, and the manner in which they burned during the procession; that, moreover, the reserved parts of the candles were deemed to possess a strong supernatural virtue:

> "This done, each man his candle lights,
> Where chiefest seemeth he,
> Whose taper greatest may be seen;
> And fortunate to be,
> Whose candle burneth clear and bright:
> A wondrous force and might
> Doth in these candles lie, which if
> At any time they light,
> They sure believe that neither storm
> Nor tempest doth abide,
> Nor thunder in the skies be heard,
> Nor any devil's spide,
> Nor fearful sprites that walk by night,
> Nor hurts of frost or hail," &c.†

The great antiquity of the festival of Candlemas is unquestionable. Its origin is almost lost in the mists of the middle ages. St Bernard, if we rightly understand Mr Hone's quotation of Butler, speaks of the procession as "first made by St Joseph, Simeon, and Anna, as an example to be followed by all the earth, walking two and two, holding in their hands candles, lighted from fire, first blessed by the priests, and singing." The festival is undoubtedly designed to commemorate the churching or purification of Mary; and the candle-bearing is understood to refer to what Simeon said when he took the infant Jesus in his arms, and declared that he was a *light to lighten the Gentiles*. Thus literally to adopt and build upon metaphorical expressions, was a characteristic procedure of the middle ages. It is alleged, however, that the festival is to be traced to ancient Roman times. An old English writer upon festivals says, that Candlemas was a Christian engraftment upon the festival of the Romans in honour of Februa, the mother of Mars, which was celebrated by women carrying torches and candles. It was, he says, Pope Sergius (a pontiff of the seventh century) who, seeing the Christian people persevering in the old Pagan custom, ordered that that custom should be continued for a Christian object—namely, as a celebration of the churching of the Virgin. Du Cange, again, says that Candlemas was substituted by Pope Gelasius for the candles which, in February, the Roman people used to carry in the Supercalia. Another explanation has been quoted from a sermon of Pope Innocent:—"The Gentiles," he says, "dedicated the month of February to the infernal gods; and, as at the beginning of it Pluto stole Proserpine, and her mother Ceres sought her in the night with lighted candles, so they, at the beginning of this month, walked about the city with lighted candles. Because the holy fathers could not utterly extirpate this custom, they ordained that Christians should carry about candles in honour of the blessed Virgin Mary; and thus, what was once done in honour of Ceres, is now done in honour of the Virgin." Apparently, in consequence of the celebration of Mary's purification by candle-bearing, it became customary for women to carry candles with them, when, after recovery from childbirth, they went to be, as it was called, *churched*. A remarkable allusion to this custom occurs in English history. William the Conqueror, become, in his elder days, fat and unwieldy, was confined a considerable time by a sickness. "Methinks," said his enemy the King of France, "the King of England lies long in childbed." This being reported to William, he said, "When I am churched, there shall be a thousand lights in France!" And he was as good as his word; for, as soon as he recovered, he made an inroad into the French territory, which he wasted wherever he went with fire and sword.

At the Reformation, the ceremonials of Candlemas day were not reduced all at once. Henry VIII. proclaimed in 1539—"On Candlemas day it shall be declared, that the bearing of candles is done in memory of Christ, the spiritual light, whom Simeon did prophesy, as it is read in the church that day." It is curious to find it noticed as a custom down to the time of Charles II., that when lights were brought in at nightfall, people would say—"God sends us the light of heaven!" The amiable Herbert, who notices the custom, defends it as not superstitious. Somewhat before this time, we find Herrick alluding to the customs of Candlemas eve: it appears that the plants put up in houses at Christmas were now removed.

> "Down with the rosemary and bays,
> Down with the mistletoe;
> Instead of holly now upraise
> The greener box for show.
>
> The holly hitherto did sway,
> Let box now domineer,
> Until the dancing Easter day
> Or Easter's eve appear.
>
> The youthful box, which now hath grace
> Your houses to renew,
> Grown old, surrender must his place
> Unto the crisped yew.
>
> When yew is out, then birch comes in,
> And many flowers beside,
> Both of a fresh and fragrant kin',
> To honour Whitsuntide.
>
> Green rushes then, and sweetest bents,
> With cooler oaken boughs,
> Come in for comely ornaments,
> To re-adorn the house.
> Thus times do shift; each thing in turn does hold;
> New things succeed, as former things grow old."

The same poet elsewhere recommends very particular care in the thorough removal of the Christmas garnishings on this eve:

> "That so the superstitious find
> No one least branch left there behind;
> For look, how many leaves there be,
> Neglected there, maids, trust to me,
> So many goblins you shall see."

He also alludes to the reservation of part of the candles or torches, as calculated to have the effect of protecting from mischief:

> "Kindle the Christmas brand, and then
> Till sunset let it burn,
> Which quench'd, then lay it up again,
> Till Christmas next return.
>
> Part must be kept, wherewith to teend
> The Christmas log next year;
> And where 'tis safely kept, the fiend
> Can do mischief there."

There is a curious custom of old standing in Scotland, in connexion with Candlemas day. On that day it is, or lately was, an universal practice in our part of the island, for the children attending school to make small presents of money to their teachers. The master sits at his desk or table, exchanging for the moment his usual authoritative look for one of bland civility, and each child goes up in turn and lays his offering down before him, the sum being generally proportioned to the abilities of the parents. Sixpence and a shilling are the most common sums in most schools; but some give half and whole crowns, and even more. The boy and girl who give most are respectively styled King and Queen. The children, being then dismissed for a holiday, proceed along the streets in a confused procession, carrying the King and Queen in state, exalted upon that seat formed of crossed hands which, probably from this circumstance, is called the *King's Chair*. In some schools, it used to be customary for the teacher, on the conclusion of the offerings, to make a bowl of punch and regale each urchin with a glass to drink the King and Queen's health, and a biscuit. The latter part of the day was usually devoted to what was called the *Candlemas bleeze*, or blaze, namely, the conflagration of any piece of furze which might exist in their neighbourhood, or, were that wanting, of an artificial bonfire. Here we probably have the relic of a different festival, that of St Blaze, whose *day* being the 3d of February, the after part of Candlemas day is of course his *eve*. St Blaze, or Blasius, was an early Bishop of Sebasta, in Armenia, and his name alone seems to have suggested the observances anciently connected with his festival in England. In the latter part of the last century, it was still customary to light fires on the hills upon St Blaze's eve. An old writer says, that on that day, "country women go about and make good cheer; and if they find any of their neighbour women a-spinning, they burn and make a blaze of fire of the distaffe." The woolcombers of Yorkshire have their great festival on this day in honour of St Blaze. There seems no better reason for the observances peculiar to his day or eve, than the jingling resemblance of his name to the word *blaze*. A sound was a reason in the days of our simple fathers.

Considering the importance attached to Candlemas day for so many ages, it is scarcely surprising that there is an universal superstition throughout Christendom, that good weather on this day indicates a long continuance of winter and a bad crop, and that its being foul is, on the contrary, a good omen. Sir Thomas Browne, in his *Vulgar Errors*, quotes a Latin distich expressive of this idea:

> "Si sol splendescat Maria purificante,
> Major erit glacies post festum quam fuit ante;"

which may be considered as well translated in the popular Scottish rhyme—

> "If Candlemas day be dry and fair,
> The half o' winter's to come and mair
> If Candlemas day be wet and foul,
> The half o' winter's gane at Yule."

A German friend at our elbow informs us that in his country there are two proverbial expressions on this

* Fosbroke's British Monachism.

* Hone's Every-Day Book, i. 201.

† Barnaby Googe's Translation of Naogeorgus, in the "Popish Kingdom." Ellis's Edition of Brand's Popular Antiquities.

subject: 1. The shepherd would rather see the wolf enter his stable on Candlemas day than the sun; 2. The badger peeps out of his hole on Candlemas day, and when he finds snow, walks abroad; but if he sees the sun shining, he draws back into his hole. It is not improbable that these notions, like the festival of Candlemas itself, are derived from Pagan times, and have existed since the very infancy of our race. So at least we may conjecture, from a curious passage in Martin's *Description of the Western Islands*. On Candlemas day, according to this author, the Hebrideans observe the following curious custom:—"The mistress and servants of each family take a sheaf of oats and dress it up in women's apparel, put it in a large basket, and lay a wooden club by it, and this they call Brüd's Bed; and then the mistress and servants cry three times, 'Brüd is come; Brüd is welcome!' This they do just before going to bed, and when they rise in the morning they look among the ashes, expecting to see the impression of Brüd's club there; which, if they do, they reckon it a *true presage of a good crop and prosperous year*, and the contrary they take as an ill omen."

A FEW WEEKS ON THE CONTINENT.

BADEN-BADEN TO BASLE.

A MORNING and forenoon's ride in a south-westerly direction brought us to Strasburg. Our carriage, on emerging from the valley of the Oes, entered the broad expanse of country through which winds the current of the Rhine, and which accordingly takes the name of the Rheinstrasse. Far on the right, in a westerly direction, the rugged outline of the Vosges mountains bounded the horizon, while on our left was the similar line of hills which terminate in the dark range called the Schwartz-wald, or Black Forest, of which there absolutely seems to be no end; for you may travel up the country for days, and there are the same dark masses fringing the great flat vale of the Rheinstrasse.

With a range of hills on the eastern and western horizon, the traveller finds not a hillock before him, as he penetrates towards Switzerland. The land is a dead level, partitioned into ill-cultivated fields, and bearing principally crops of hemp. We are, in fact, in one of the great hemp-growing districts of Europe. It grows in tall green stalks, not unlike bunches of hemlock, and apparently requires less assistance from skill or capital than most other crops. This is fortunate, as the peasantry who raise it are seemingly of a poor and toil-worn order. It being the time of hemp harvest, all were busy in their vocation. In every village, women and children sat before the doors stripping the fibres from the husky stalks; while the men were leading home from the fields waggons loaded with materials for their industry. The appearance of these vehicles bespoke the poverty of the people. They were of rude construction, on low wheels, and drawn by cows. Horses, as beasts of husbandry, we had some days ago seen for the last time, and cows had every where been pressed into the service. We see cows ploughing, cows harrowing, and cows drawing waggons in all quarters. I was told that the exercise is beneficial, but still have an opinion that there is something like shabbiness in making cows both give milk and draw carts at the same time, and that, after all, a cow never looks so respectable as when grazing, or chewing its cud in a dreamy contented humour, in a rich green paddock. At all events, much as there is to improve among us, I trust it will be long ere our statisticians, in summing up the amount of animate forces in England, will include the item of so many thousand "cow power."

Shortly after the hour of noon, the spires of Strasburg came prominently into view, at the distance of about two miles; and immediately approaching the Rhine, we crossed by a wooden bridge to the left bank. Here the country is so low and level as to be liable to flooding from the river, which, though hemmed in by artificial banks, has broken into various channels and creeks, making two or three swampy islands, partially covered with bushes and reeds. Passing through a poor-looking small town on the first island, we are again brought to the bank of the second main branch of the Rhine, forming the boundary of Germany. The two sides are connected by a long bridge of boats, anchored in the impetuous stream, the end which we are just leaving being honoured with the attendance of a sentinel in the uniform of Baden, and the other being similarly in charge of a French soldier—of whom there can be no mistake: his small stature, shambling figure, and dirty red trousers, at once mark the country to which he belongs. Another circumstance immediately reminded us we were now within the confines of France. At a custom-house by the wayside, we were brought to a halt, while the carriage and baggage were subjected to the search of a *douanier*. Nothing, of course, was found to justify this official scrutiny; but it would be unfair to complain of what every one must encounter on landing in any part of Great Britain. The French and English custom-house functionaries can claim equal honour in the dexterity with which they turn out the contents of a lady's *sac-de-nuit*.

Strasburg, which is reached at the distance of a mile from the Rhine, occupies a low swampy situation on the river Ill, which, divided into numerous channels, intersects the town in different directions, and forms wet ditches around it. Nothing is to be seen on approaching but heavy bastioned walls, emerging from dead pools of water and moist green meadows. Passports are demanded at the gates; we enter winding, gloomy, and badly paved streets, and are finally hurled into the Grand Place—an open square, in which our hotel is situated, and which possesses only one object of attraction, placed in the centre—a bronze statue of General Kleber, who was a native of the town. Although politically belonging to France, since it was taken by Louis XIV. in 1681, Strasburg is still essentially German. The greater number of signboards, and also the language of the inhabitants, are German; and we had the pleasure of hearing a German sermon in one of the churches, to a congregation composed, as usual, of women. The cathedral is the main, if not the only, object of interest in the town; and it was only to see it that we stayed a night in so abominable a place. The first sight of this remarkable edifice is rather disappointing; but it improves considerably on a closer inspection. Of two tall towers, which were designed to form its western extremity, only one is finished, and the other is docked off half way up—a number of Gothic cathedrals on the continent, however, being equally incomplete. The Strasburg cathedral is likewise by no means singular in being stuck nearly round with parasitical buildings, occupied either as shops of small traders or as a paltry order of dwelling-houses. That part which is free to the eye of the spectator, from the ground upwards, is the most magnificent and vast portion of the structure—the western termination, in which is the chief portal, between the elevations of the two towers. Although time-worn, dingy, and injured by revolutionary mobs, the exterior of the west end is excessively fine—certainly the finest and most gigantic piece of Gothic architecture which I had ever seen; and as we stood in the confined square in front, scrutinising its elaborate carvings and great height, we could not but alike admire the taste of the architects and the patient enthusiasm of the people who raised such a noble fabric. The building is not all of one era. A church which had existed from an early period on the spot, having been destroyed, partly by military violence and partly by an accidental fire, at the beginning of the eleventh century, the present edifice was begun on the ancient foundations in the year 1015, and, after various stoppages, was completed as we now see it in 1439. The first masons in Europe were employed in the great work, and crowds of inferior workmen came from all quarters to assist in the undertaking. The architect who planned and partly executed the grand portal and towers, and the two lateral portals, was the celebrated Erwin de Steinbach, who, dying in 1318, before the completion of his task, was succeeded by his son John and his daughter Sabine, whose genius was of the same high order. Many of the finest sculptures on the portals are the device of this accomplished female architect.

The western extremity, on which has been lavished such immense labour, has the grand portal in the centre, with two lesser doorways on each side. Each of these three main entrances is deeply vaulted, and altogether covered with figures in relief, representing scripture scenes or characters. Above the central and lofty doorway is the *rosace*, or rose window, resembling a richly carved wheel, filled with variously coloured glass, and measuring upwards of fifty feet in diameter. Above the storey in which is the rosace, there is another storey occupied by a row of tall windows in florid Gothic; while the numerous flying buttresses are also highly ornamented and full of historic figures, among which are pointed out Clovis, Dagobert, the Emperor Rodolphe of Hapsburg, and Louis XIV.—a personage who must have been stuck up at a comparatively recent period, after the capture of the town. The turret or spire which is completed is that on our left, in looking towards the entrance, and is therefore over one of the lateral portals.

This lofty spire, as is well known, is reckoned one of the most beautiful specimens of the light Gothic. Seen from the ground, it appears a tall open framework of sculptured stone, with an equally light shaft or buttress at each of its four angles, containing individually a stair, which to our eye appears like a cork-screw of stone winding aloft to the pointed pinnacle. That this elegant object of art has withstood the blasts of four centuries, is a sufficient proof of the skill of its ingenious architect.

Having satisfied ourselves with the exterior of the cathedral, we entered the edifice, and found the inner part equally interesting. The plan is the same as that of the minster at Canterbury, the choir being raised four or five feet above the level of the nave, which adds to the imposing effect. The total length of the interior is about 350 feet. Like most churches in France, the wide expanse of floor, and other parts, are not remarkable for cleanliness; and though in the midst of vespers, when some hundreds were kneeling in all directions, the beadle, a person in a uniform, with a long staff, at once stuck to us on seeing we were English, and piloted us through clusters of worshippers to every place worthy our observation. Lighting a candle at one of the shrines, he opened a wicket leading to certain vaults beneath the choir, which he described by the very appropriate name of the Chapelle de Saint-Sepulchre. At the bottom of a flight of steps, we found it as dark as midnight; but by a free use of the candle, the outlines of the horrid dungeon were perceived to embrace a stone altar, which is used in certain gloomy offices of religion in Holy Week, together with a group of poorly sculptured figures as large as life, representing Jesus and his disciples in the garden, at the moment when Judas, accompanied by Jews and Roman soldiers, enters on the scene. The loquacious official, who explained all these matters, pointed to a stair leading to a still lower depth, where he said we might see the foundations of the cathedral; but declining the invitation to descend to these nether regions, we made the best of our way to the daylight above.

The grand altar in the choir, a splendid erection of marble, constructed in 1763, is reckoned one of the finest things of its kind; but decidedly the most elegant object is the pulpit, resting against one of the lofty pillars in the open nave. We have nothing at all to compare with this work of art in England. It is of stone, richly sculptured in every part, resting on six small columns, with one in the centre, all niched and filled with finely-cut scripture figures; the overhanging roof is of the same exquisite workmanship. The whole is by the architect, J. Hammerer, who constructed it in 1487. In one part of the building is the clock, or *horloge astronomique*, which once rendered the cathedral famous. It is now in disuse, and of no sort of moment.

Leaving the nave, into which streamed the many-coloured rays of the evening sun through the gorgeous rosace, we, by permission, ascended the winding stair in the truncated tower to the platform at which it abruptly terminates. The ascent was quite safe, but so toilsome, that we had no wish to penetrate to the summit of the complete tower, which rises to a height of 474 English feet, or 24 feet higher than the highest Egyptian pyramid, and is therefore the most lofty work of art in the world. The height of the platform which we attained appears to be less than two-thirds of the adjoining tower, yet at this altitude, or nearly 300 feet from the ground, the whole country for fifty miles around lay spread out like a garden before us, with the branching Rhine winding through it like threads of silver. The town immediately beneath seemed a pent-up group of houses, with dingy roofs of brown flat tiles, and we gazed down upon the people as they moved to and fro in the market-place as one may be supposed to look upon the diminutive bustle of an ant-hill. A tolerably strong set of nerves is required to lean upon the stone balustrade which environs the turret; yet a story is told of a certain bold curé, who, in 1522, had the temerity to run round it, without falling. A gentleman, with more courage than discretion, at the beginning of last century, wished to imitate or excel the curé, and declared he would run three times round the top of the balcony. He performed two courses safely, but at the third his foot slipped, and he was instantly precipitated to the ground and killed. A faithful dog which accompanied him, wishing to follow its master, immediately plunged from the platform, and met with the same sad fate. To commemorate the event, the figure of a dog was carved in stone, and placed on the exterior of the edifice. A female, a number of years ago, committed suicide by throwing herself from the platform to the ground. In her descent, one of her shoes came off, and was caught on the point of one of the small projecting pinnacles; and there, as an architectural conceit, the figure of a shoe in stone was afterwards placed.

The view over the town from this lofty station, as well as a ramble through its streets, conveys a forcible impression of the miseries produced by hemming a populous city within fortified walls. Over the expanse of the town, I did not see a single inch of garden or any patch of green behind the houses; and the only little spot devoted to the culture of flowers was the flat roof of a house, to which earth and plants had been carried, doubtless by some lover of nature dwelling beneath. The buildings are generally very tall, and such is the apparent scarcity of room, that

in some streets each house contains a number of distinct establishments—the cellar laid out as tan-pits, the next floor a workshop, the next two or three as dwelling-houses, and the uppermost a drying loft for tobacco. Statistical returns respecting the mode of living in the walled towns of France, of which I think Strasburg must be among the most vile, disclose a state of things too painful to be entered upon.

Besides the monument of Kleber, the town has recently been ornamented with a statue of Guttemberg, the inventor of printing, who produced some of his earliest works here. Nobody can object to these memorials of respect from the inhabitants; but surely the best monument of Guttemberg is a free press, which the French unfortunately have not; and, in the present state of matters with the Strasburgians, it should, I imagine, be drains first, and public embellishments afterwards.

It was with no small gratification, that, at ten o'clock, on a beautiful Sunday morning, we took our seats in the omnibus which was to convey us to the station of the railway for Basle, situated a mile or two from the gates of the town. The road was crowded with parties, bound for holiday excursions; and when we arrived at the terminus of the railway, we found the place literally like a fair, with hundreds of men and women, in their best attire, waiting for the arrival of the train. The *chemin de fer* had been opened only a week or two before, and was highly popular. Extending to a length of between eighty and ninety miles, it is, I believe, the largest work of the kind yet accomplished by the French government; and for such a backward country as France, may be considered a really wonderful undertaking. Whether it will ultimately answer as a pecuniary speculation, I have no means of judging; but as it affords by far the readiest mode of reaching Switzerland, cutting off a tedious voyage in the steamer against the impetuous current of the Rhine, or the equally tiresome journey by voiture, it is likely to meet with encouragement. As is the case with all the railways on the continent, the fares are remarkably low. For three places in a first-class carriage, we were charged, for the whole distance to Basle, no more than 41 francs 85 centimes, or about 11s. 6d. for each person.

The train, after a little delay, having arrived, it was in a few minutes filled with passengers of all classes, and went off at a rapid and steady pace, the confidence of our party in the locomotive not being lessened by perceiving the word *Manchester* engraved on a plate on its side. The line of route proceeds through the ancient district of Alsace, the bulk of which is a broad strip of land between the Vosges mountains on our right and the Rhine on the left. In the course of the journey, the train stopped frequently at villages to take up and set down passengers, a number of whom were dressed in the peculiar costume once prevalent in Alsace. The figures of the women were highly picturesque. The various parts of the attire were of different brilliant colours, and from the fancifully decorated head there generally depended a stream of ribbons or beads. One young female, whose dress we scrutinised, was gaily set out in a scarlet petticoat and blue apron, surmounted by a green body ornamented with gold flowers; she had also a highly embroidered stomacher, a white linen jacket, laid in plaits down the breast, a flashy silk handkerchief round the neck; and on her head was a black cap, embroidered with gold and white beads, tied at the top with an enormous bow of black ribbons. The head-dress was almost universally black, and in most cases thickly sprinkled with golden flowers sewed in the material. The shape and appearance of the women by no means corresponded with these gaieties of attire. Their figures were generally uncouth, probably from severe toil in the fields, and the faces of some of the most aged, ensconced in antique glittering hoods, were so brown and puckered as scarcely to appear human.

As we approached the termination of our excursion, the signs of manufacturing industry became more and more apparent, in the form of factories with tall chimneys; and Mulhausen, which we closely passed, was to all appearance a manufacturing town in the course of rapid extension. Twenty thousand workmen, I am told, are employed in this busy town and its vicinity, chiefly in the preparation of printed calicoes and silks. Mulhausen was at one time the capital of a Swiss canton, but the district has been annexed to France since the year 1795; and thus the French are fortunate in having secured a tract of country animated with the industry and common sense of a Swiss German population.

At the distance of a few miles from Mulhausen, the hills of Switzerland, canton of Basle, begin to make their appearance before us, and we may be said to have arrived at nearly the southern extremity of the great plain which commences in the neighbourhood of Mayence, where the romantic scenery of the Rhine has terminated in the vine-clad eminences of the Rheingau. The Swiss hills which now lie before us, it is, however, necessary to remember, are confined to the left or western bank of the Rhine, the opposite side being still flat, and belonging to the Dukedom of Baden for many miles farther. With this prospect of a speedy conclusion to our trip, the railway train, in the space of five and a half hours from starting, drove up to its terminus at St Louis, a village within the frontier of France, at which an immense concourse of people from Basle were in the height of festivities, the day being the anniversary of the fête of St Louis, and therefore sacred at once to devotion and merriment. The public highway leading to Basle, at the distance of about a mile, was thronged very much, but not a single instance of intoxication came under our notice; and so, in the midst of hundreds of good-humoured excursionists, we were carried forward as in a flood towards the gates of this venerable member of the Helvetic republic. As the Swiss confederation, to its honour be it spoken, has no custom-house to torment travellers arriving within its territory, we were subjected to no sort of stoppage in entering Basle, and were driven at once to our hotel, the excellent and well-known house, the Drei Könige, or Three Kings, placed on the very brink of the green and rapidly flowing Rhine.

HAUNTED HOUSES.

We have found much amusement in a work recently published under the title of "Memoirs of Extraordinary Popular Delusions," the author of which is Mr Charles Mackay, known as a frequent contributor to some of the metropolitan periodicals, and as the writer of "The Thames and its Tributaries," as well as other productions of a light literary kind.* It may be said to consist of an extension of ideas slightly touched upon in the article headed "Moral Epidemics," which appeared in the present Journal. The Crusades, and various other cases of popular frenzy, form the objects of Mr Mackay's notice; and he writes of them in a lively, spirited, and sensible manner. As the "Witch Mania" and other common delusions have been recently discussed here at some length, we prefer to give, as a specimen of his work, a portion of the concluding chapter on "Haunted Houses." The first place, in a selection from cases of this nature, is justly due to the renowned Ghost of Cock Lane, which created a wonderful sensation in London at the period of its supposed appearance:—"At the commencement of the year 1760, there resided in Cock Lane, near West Smithfield, in the house of one Parsons, the parish clerk of St Sepulchre's, a stockbroker named Kent. The wife of this gentleman had died in childbed during the previous year, and his sister-in-law, Miss Fanny, had arrived from Norfolk to keep his house for him. They soon conceived a mutual affection, and each of them made a will in the other's favour. They lived some months in the house of Parsons, who, being a needy man, borrowed money of his lodger. Some difference arose betwixt them, and Mr Kent left the house, and instituted legal proceedings against the parish clerk for the recovery of his money.

While this matter was yet pending, Miss Fanny was suddenly taken ill of the small-pox, and, notwithstanding every care and attention, she died in a few days, and was buried in a vault under Clerkenwell church. Parsons now began to hint that the poor lady had come unfairly by her death, and that Mr Kent was accessory to it, from his too great eagerness to enter into possession of the property she had bequeathed him. Nothing further was said for nearly two years; but it would appear that Parsons was of so revengeful a character that he had never forgotten or forgiven his differences with Mr Kent, and the indignity of having been sued for the borrowed money. The strong passions of pride and avarice were silently at work during all that interval, hatching schemes of revenge, but dismissing them one after the other as impracticable, until at last a notable one suggested itself. About the beginning of the year 1762, the alarm was spread over all the neighbourhood of Cock Lane, that the house of Parsons was haunted by the ghost of poor Fanny, and that the daughter of Parsons, a girl about twelve years of age, had several times seen and conversed with the spirit, who had, moreover, informed her that she had not died of the small-pox, as was currently reported, but of poison administered by Mr Kent. Parsons, who originated, took good care to countenance these reports; and, in answer to numerous inquiries, said his house was every night, and had been for two years, in fact ever since the death of Fanny, troubled by a loud knocking at the doors and in the walls. Having thus prepared the ignorant and credulous neighbours to believe or exaggerate for themselves what he had told them, he sent for a gentleman of a higher class in life to come and witness these extraordinary occurrences. The gentleman came accordingly, and found the daughter of Parsons, to whom the spirit alone appeared, and whom alone it answered, in bed, trembling violently, having just seen the ghost, and been again informed that she had died from poison. A loud knocking was also heard from every part of the chamber, which so mystified the not very clear understanding of the visiter, that he departed, afraid to doubt and ashamed to believe, but with a promise to bring the clergyman of the parish and several other gentlemen on the following day, to report upon the mystery.

On the following night he returned, bringing with him three clergymen, and about twenty other persons, including two negroes, when, upon a consultation with Parsons, they resolved to sit up the whole night, and await the ghost's arrival. It was then explained by Parsons, that although the ghost would never render itself visible to any body but his daughter, it had no objection to answer the questions that might be put to it by any person present, and that it expressed an affirmation by one knock, a negative by two, and its displeasure by a kind of scratching. The child was then put into bed along with her sister, and the clergymen examined the bed and bed-clothes to satisfy themselves that no trick was played, by knocking upon any substance concealed among the clothes. As on the previous night, the bed was observed to shake violently.

After some hours, during which they all waited with exemplary patience, the mysterious knocking was heard in the wall, and the child declared that she saw the ghost of poor Fanny. The following questions were then gravely put by the clergyman, through the medium of one Mary Frazer, the servant of Parsons, and to whom it was said the deceased lady had been much attached. The answers were in the usual fashion, by a knock or knocks:—

'Do you make this disturbance on account of the ill usage you received from Mr Kent?' 'Yes.'

'Were you brought to an untimely end by poison?' 'Yes.'

'How was the poison administered—in beer or in purl?' 'In purl.'

'How long was that before your death?' 'About three hours.'

'Can your former servant, Carrots, give any information about the poison?' 'Yes.'

'Are you Kent's wife's sister?' 'Yes.'

'Were you married to Kent after your sister's death?' 'No.'

'Was any body else, besides Kent, concerned in your murder?' 'No.'

'Can you, if you like, appear visibly to any one?' 'Yes.'

'Will you do so?' 'Yes.'

'Can you go out of this house?' 'Yes.'

'Is it your intention to follow this child about every where?' 'Yes.'

'Are you pleased in being asked these questions?' 'Yes.'

'Does it ease your troubled soul?' 'Yes.'

[Here there was heard a mysterious noise, which some wiseacre present compared to the fluttering of wings.]

'How long before your death did you tell your servant, Carrots, that you were poisoned—an hour?' 'Yes.'

[Carrots, who was present, was appealed to; but she stated positively that such was not the fact, as the deceased was quite speechless an hour before her death. This shook the faith of some of the spectators, but the examination was allowed to continue.]

'How long did Carrots live with you?' 'Three or four days.'

[Carrots was again appealed to, and said that this was true.]

'If Mr Kent is arrested for this murder, will he confess?' 'Yes.'

'Would your soul be at rest if he were hanged for it?' 'Yes.'

'Will he be hanged for it?' 'Yes.'

'How long a time first?' 'Three years.'

'How many clergymen are there in this room?' 'Three.'

'How many negroes?' 'Two.'

'Is this watch (held up by one of the clergymen) white?' 'No.'

'Is it yellow?' 'No.'

'Is it blue?' 'No.'

'Is it black?' 'Yes.'

[The watch was in a black shagreen case.]

'At what time this morning will you take your departure?'

The answer to this question was four knocks, very distinctly heard by every person present; and accordingly, at four o'clock precisely, the ghost took its departure to the Wheatsheaf public-house, close by, where it frightened mine host and his lady almost out of their wits, by knocking in the ceiling right above their bed.

The rumour of these occurrences very soon spread over London, and every day Cock Lane was rendered impassable by the crowds of people who assembled around the house of the parish clerk, in expectation of either seeing the ghost or of hearing the mysterious knocks. It was at last found necessary, so clamorous were they for admission within the haunted precincts, to admit those only who would pay a certain fee, an arrangement which was very convenient to the needy and money-loving Mr Parsons. Indeed, things had taken a turn greatly to his satisfaction; he not only had his revenge, but he made a profit out of it. The ghost, in consequence, played its antics every night, to the great amusement of many hundreds of people, and the great perplexity of a still greater number.

Unhappily, however, for the parish clerk, the ghost was induced to make some promises which were the means of utterly destroying its reputation. It promised, in answer to the questions of the Rev. Mr Aldritch of Clerkenwell, that it would not only follow the little Miss Parsons wherever she went, but would also attend him, or any other gentleman, into the vault under St John's Church, where the body of the murdered woman was deposited, and would there give notice of its presence by a distinct knock upon the coffin. As a preliminary, the girl was conveyed to the house of Mr Aldritch near the church, where a large party of ladies and gentlemen, eminent for their acquirements, their rank, or their wealth, had assembled.

* Memoirs of Extraordinary Popular Delusions. London: Richard Bentley. 1841.

About ten o'clock on the night of the 1st of February, the girl having been brought from Cock Lane in a coach, was put to bed by several ladies in the house of Mr Aldritch; a strict examination having been previously made that nothing was hidden in the bed-clothes. While the gentlemen, in an adjoining chamber, were deliberating whether they should proceed in a body to the vault, they were summoned into the bedroom by the ladies, who affirmed, in great alarm, that the ghost was come, and that they heard the knocks and scratches. The gentlemen entered accordingly, with a determination to suffer no deception. The little girl, on being asked whether she saw the ghost, replied, "No; but she felt it on her back like a mouse." She was then required to put her hands out of bed, and they being held by some of the ladies, the spirit was summoned in the usual manner to answer, if it were in the room. The question was several times put with great solemnity; but the customary knock was not heard in reply in the walls, neither was there any scratching. The ghost was then asked to render itself visible, but it did not choose to grant the request. It was next solicited to give some token of its presence by a sound of any sort, or by touching the hand or cheek of any lady or gentleman in the room; but even with this request the ghost would not comply.

There was now a considerable pause, and one of the clergymen went down stairs to interrogate the father of the girl, who was waiting the result of the experiment. He positively denied that there was any deception, and even went so far as to say that he himself, upon one occasion, had seen and conversed with the awful ghost. This having been communicated to the company, it was unanimously resolved to give the ghost another trial; and the clergyman called out in a loud voice to the supposed spirit, that the gentleman, to whom it had promised to appear in the vault, was about to repair to that place, where he claimed the fulfilment of its promise. At one hour after midnight they all proceeded to the church, and the gentleman in question, with another, entered the vault, and took up their position alongside of the coffin of poor Fanny. The ghost was then summoned to appear, but it appeared not; it was summoned to knock, but it knocked not; it was summoned to scratch, but it scratched not; and the two retired from the vault, with the firm belief that the whole business was a deception practised by Parsons and his daughter. There were others, however, who did not wish to jump so hastily to a conclusion, and who suggested that they were perhaps trifling with this awful and supernatural being, which, being offended with them for their presumption, would not condescend to answer them. Again, after a serious consultation, it was agreed on all hands that, if the ghost answered any body at all, it would answer Mr Kent, the supposed murderer; and he was accordingly requested to go down into the vault. He went with several others, and summoned the ghost to answer whether he had indeed poisoned her. There being no answer, the question was put by Mr Aldritch, who conjured it, if it were indeed a spirit, to end their doubts—make a sign of its presence, and point out the guilty person. There being still no answer for the space of half an hour, during which time all these boobies waited with the most praiseworthy perseverance, they returned to the house of Mr Aldritch, and ordered the girl to get up and dress herself. She was strictly examined, but persisted in her statement that she used no deception, and that the ghost had really appeared to her.

So many persons had, by their openly expressed belief of the reality of the visitation, identified themselves with it, that Parsons and his family were far from being the only persons interested in the continuance of the delusion. The result of the experiment convinced most people; but these were not to be convinced by any evidence, however positive, and they therefore spread abroad the rumour that the ghost had not appeared in the vault, because Mr Kent had taken care beforehand to have the coffin removed. That gentleman, whose position was a very painful one, immediately procured competent witnesses, in whose presence the vault was entered and the coffin of poor Fanny opened. Their deposition was then published; and Mr Kent indicted Parsons and his wife, his daughter, Mary Frazer the servant, the Rev. Mr Moor, and a tradesman, two of the most prominent patrons of the deception, for a conspiracy. The trial came on in the Court of King's Bench, on the 10th of July, before Lord Chief-Justice Mansfield, when, after an investigation which lasted twelve hours, the whole of the conspirators were found guilty. The Rev. Mr Moor and his friend were severely reprimanded in open court, and recommended to make some pecuniary compensation to the prosecutor for the aspersions they had been instrumental in throwing upon his character. Parsons was sentenced to stand three times in the pillory, and to be imprisoned for two years: his wife to one year's, and his servant to six month's imprisonment in the Bridewell. A printer, who had been employed by them to publish an account of the proceedings for their profit, was also fined fifty pounds, and discharged.

The precise manner in which the deception was carried on has never been explained. The knocking in the wall appears to have been the work of Parsons' wife, while the scratching part of the business was left to the little girl. That a contrivance so clumsy could have deceived any body, cannot fail to excite our wonder. But thus it always is. If two or three persons can only be found to take the lead in any absurdity, however great, there is sure to be plenty of imitators. Like sheep in a field, if one clears the stile, the rest will follow."

Well may Mr Mackay express surprise that men capable of a moment's sound reflection should not have seen at once the utter absurdity of the supposition, that a supernatural being, if such had really been permitted to visit the living world, would have come to play the part of an invisible rat, to scratch upon bed-heads, pull down plates, and frighten poor old women, who had done nothing in the slightest degree connected with the mission of annoyance. Mr Mackay cites other instances of alarms scarcely less absurd, one of them of old date. A community of monks established near Paris by St Louis, having cast eyes of affection upon a handsome old palace in their neighbourhood, named Vauvert, commenced playing such pranks about it as caused it to be instantly reputed as haunted. By these means they actually succeeded in their object. We have another instance of a house being deserted, shunned, and finally sold for an old song, merely in consequence of an occasional noise ultimately traced to the clanking of a loose door in the lower storey. We recollect ourselves a house at Slateford, near Edinburgh, which for some weeks was an object of dread to all the country round, for no other reason than a derangement of the water-pipes.

The only other anecdote for which we can find room, is one relating to a remarkable case which also occurred within our recollection, and for some time was a theme of far-spread wonder. Like the Cock-Lane affair, it takes a strong hue of the ridiculous. "On the 5th of December (1828), the inmates of the farm-house of Baldarroch, in the district of Banchory, Aberdeenshire, were alarmed by observing a great number of sticks, pebble-stones, and clods of earth, flying about their yard and premises. They endeavoured, but in vain, to discover who was the delinquent; and the shower of stones continuing for five days in succession, they came at last to the conclusion that the devil and his imps were alone the cause of it. The rumour soon spread over all that part of the country, and hundreds of persons came from far and near to witness the antics of the devils of Baldarroch. After the fifth day, the shower of clods and stones ceased on the outside of the premises, and the scene shifted to the interior. Spoons, knives, plates, mustard-pots, rolling-pins, and flat-irons, appeared suddenly endued with the power of self-motion, and were whirled from room to room, and rattled down the chimneys, in a manner which nobody could account for. The lid of a mustard-pot was put into a cupboard by the servant girl, in the presence of scores of people, and in a few minutes afterwards came bouncing down the chimney, to the consternation of every body. There was also a tremendous knocking at the doors and on the roof, and pieces of stick and pebble-stones rattled against the windows and broke them. The whole neighbourhood was a scene of alarm; and not only the vulgar, but persons of education, respectable farmers, within a circle of twenty miles, expressed their belief in the supernatural character of these events, and offered up devout prayers to be preserved from the machinations of the Evil One. The note of fear being once sounded, the visiters, as is generally the case in all tales of wonder, strove with each other who should witness the most extraordinary occurrences; and within a week, it was generally believed in the parishes of Banchory-Ternan, Drumoak, Durris, Kincardine-O'Neil, and all the circumjacent districts of Mearns and Aberdeenshire, that the devil had been seen in the act of hammering upon the house-top of Baldarroch. One old man asserted positively, that one night, after having been to see the strange gambols of the knives and mustard pots, he met the phantom of a great black man, 'who wheeled round his head with a whizzing noise, making a wind about his ears that almost blew his bonnet off,' and that he was haunted by him in this manner for three miles. It was also affirmed and believed, that all horses and dogs that approached this enchanted ground, were immediately affected—that a gentleman, slow of faith, had been cured of his incredulity by meeting the butter-churn jumping in at the door as he himself was going out—that the roofs of houses had been torn off, and that several ricks in the corn-yard had danced a quadrille together, to the sound of the devil's bagpipes re-echoing from the mountain-tops. The women in the family of the persecuted farmer of Baldarroch also kept their tongues in perpetual motion; swelling with their strange stories the tide of popular wonder. The good-wife herself, and all her servants, said, that whenever they went to bed, they were attacked with stones and other missiles, some of which came below the blankets and gently tapped their toes. One evening, a shoe suddenly darted across a garret where some labourers were sitting, and one of the men, who attempted to catch it, swore positively that it was so hot and heavy he was unable to hold it.

Among the persons drawn to Baldarroch by these occurrences were the heritor, the minister, and all the elders of the kirk, under whose superintendence an investigation was immediately commenced. Their proceedings were not promulgated for some days; and, in the mean time, rumour continued to travel through all the Highlands, magnifying each mysterious incident the farther it got from home. There were, of course, some sensible and educated people, who, after stripping the stories circulated of their exaggeration, attributed all the rest to one or other of two causes—first, that some gipsies, or strolling mendicants, hidden in the neighbouring plantation, were amusing themselves by working on the credulity of the country people; or, secondly, that the inmates of Baldarroch carried on this deception themselves, for some reason or other, which was not very clear to anybody. The last opinion gained but few believers, as the farmer and his family were much respected; and so many persons had, in the most open manner, expressed their belief in the supernatural agency, that they did not like to stultify themselves by confessing that they had been deceived.

At last, after a fortnight's continuance of the noises, the whole trick was discovered. The two servant girls were strictly examined, and then committed to prison. It appeared that they were alone at the bottom of the whole affair, and that the extraordinary alarm and credulity of their master and mistress, in the first instance, and of the neighbours and country people afterwards, made their task comparatively easy. A little common dexterity was all they had used; and, being themselves unsuspected, they swelled the alarm by the wonderful stories they invented. It was they who loosened the bricks in the chimneys, and placed the dishes in such a manner on the shelves, that they fell on the slightest motion. They were no sooner secured in the county jail than the noises ceased, and most people were convinced that human agency alone had worked all the wonder. Some few of the most devoutly superstitious still held out in their first belief, and refused to listen to any explanation."

Though the materials of a great part of the volumes before us are by no means of a very novel character, the agreeable manner in which they are thrown together will amply repay the trouble of perusing the book, as, indeed, our citations will probably have satisfied the reader.

OPIUM-SMOKING IN CHINA.

The following is an extract from the private journal of Dr Hill, late surgeon of the bark *Sunda*, which was lost on the island of Hainan, in October 1839, and whose crew were conducted to Canton under protection of the Chinese government:—

"On the evening of our arrival at the city of Hainan (which is about six miles from the northern extremity of the island of the same name), one of the soldiers who formed our body-guard requested permission to smoke his opium in the apartment allotted to the captain, chief officer, and myself. To this, as we had not previously had an opportunity of properly witnessing the whole process, we cheerfully agreed.

The apparatus, which was contained in a leather-bag, consisted of a small box of opium, a pipe of a peculiar construction, a lamp, and a steel bodkin about six inches in length.

The opium, which was contained in a wooden box not much larger than a lady's thimble, was a clear, dark, semi-fluid substance, resembling tar or treacle, though of rather more consistence, and prepared, so far as I could understand, from the crude drug by boiling, straining, and evaporating.

The pipe, which was made of ebony, was about eighteen inches in length, and three-quarters of an inch in diameter, and had a brass bowl near its further extremity, which was closed. In shape, the bowl resembled a pear, having its upper surface smooth and flattened, with a small aperture in its centre, sufficient to admit a needle of moderate size. The use of the lamp and bodkin, which need not be described, will be seen presently.

Drawing a table with his apparatus to the side of a bamboo couch, upon which he seated himself cross-legged, after the manner of the Turks, our hero began by lighting the lamp, over which he placed a glass shade, so as to render the flame strong and steady, and prevent its smoking. He then took a small quantity of the drug (of the size of a pea) on the point of the bodkin, and held it for a few seconds in the flame of the lamp, when it swelled and took fire, emitting smoke of a strong aromatic and not unpleasant odour. Instantly blowing it out, he rolled it for a short time on the bowl of the pipe (by swiftly twirling round the bodkin between the forefinger and thumb), and again applied it to the flame of the lamp to undergo the same process for two or three successive times. After being sufficiently burned, he next introduced the bodkin into the aperture of the bowl, twisting it gently round, so as to detach from its point the opium which was left adhering to the edges. Lastly, having made a deep expiration, in order to expel the air as much as possible from his lungs, he put the pipe into his mouth, applied the bowl to the flame of the lamp, and took one long inspiration, by which the opium was almost entirely dissipated and converted into a dense smoke, which, after retaining in the chest for a short time, he emitted through his nostrils. The same process was repeated eight times in the course of twenty minutes, when he lay down on the couch and fell into a profound sleep, which lasted nearly three hours. On awaking, which he did of his own accord, he appeared stupid and confused, and seemingly not a little surprised at finding himself in the company of foreigners, when, recollecting himself, he burst into an immoderate fit of laughter.

In the present instance, that of a young man about twenty-four years of age, after the second inhalation of the drug, the eyes became full and sparkling, the face began to flush, and the pulse to increase in quickness and fullness; the breathing likewise became more fre-

quent, and the whole system seemed considerably excited. These symptoms continued to increase until the seventh application to the opium pot (which took place about a quarter of an hour from the commencement), at which time the pulse was full and bounding, and beating at the rate of 120 in the minute.

After the next two applications, which were completed within five minutes more, though much less dexterously than the previous ones, he appeared quite stupified by the drug, and lying down on the couch, instantly fell asleep.

Being desirous of ascertaining how long he would continue in this state, we did not disturb him, although he snored most profoundly, but allowed him to awake of his own accord, which he did in about three hours afterwards.

Considerable depression seemed now to have followed the previous excitement; the eyes, though still full and projecting, being dull and heavy, and the whole countenance having a languid and stupid expression. The breathing was likewise heavy, and the pulse considerably below the natural standard, being full and labouring, and scarcely beating sixty in the minute.

The immediate effect, therefore, of the drug in the present instance, and likewise in any other which afterwards came under my observation, was that of a strong stimulant. This, however, was soon succeeded by a still more powerfully sedative effect, which takes place sooner or later, according to the habits of the individual. An old hand will frequently smoke for hours before being completely under its influence; while a beginner, as we observed in the case of our cook, will sometimes be stupified by two or three whiffs.

Amongst the Chinese, the use of opium is almost universal, at least among the male portion of the community, and is far from being confined to the higher or wealthier classes, being equally prevalent amongst the very lowest, many of whom would rather want their dinner than be deprived of the intoxicating drug. Notwithstanding the severe penalties incurred by those found making use of it, it scarcely ever appeared to be made a secret of, smoking shops abounding in every town and village through which we passed. In addition to a tobacco-pipe, which each carried along with him, amongst our guard of honour (consisting of a head policeman, as he was called, half a dozen soldiers, four palanquin bearers, and three wheelbarrow men), there were generally to be found several opium pipes, which were made use of occasionally in the course of the day's march. Tobacco, however, was principally made use of during the day, the opium being reserved till the evening, when they would commence after supper, and smoke until they could no longer put the pipe into their mouths. As can easily be imagined, the habitual use of opium, at least as made use of by the Chinese, produces the most injurious effects upon the constitution —still more, probably, than that of ardent spirit. The peculiar languid and vacant expression, the sallow and shrivelled countenance, the dim and sunken eye, and the general emaciated and withered appearance of the body, easily distinguish the confirmed opium-smoker. The mind likewise soon participates in the general wreck of the body; and the unhappy individual, losing all relish for society, remains in a state of sottish indifference to every thing around him but the deadly drug, now his only solace, which sooner or later hurries its victim to an untimely grave.

The most inveterate opium-smoker that came under our observation, during a journey of two months through the interior of the country, was the head policeman, under whose charge we were from the island of Hainan to the mainland of China. This individual was evidently an old stager, and went through the operation with great neatness and dexterity. Commencing soon after he came on board (about five o'clock in the afternoon), he continued without intermission until midnight, when, tired with observing him, I fell asleep.

The refuse of the pipe likewise is much prized, especially where a superior specimen of the drug has been made use of, and is generally the perquisite of one of the servants, who forms it into pills by mixing it with a little oil, to which he treats himself while his master is in a state of oblivion."

PILE-DRIVING MACHINE.

A very simple yet very admirable machine for driving a double row of piles, has recently been imported from the United States. It was built at Utica, and has the national name "Brother Jonathan" inscribed on it. It is now in operation at Smith's Timber Wharf, Pedlar's Acre, where it can be seen driving the piles for the causeway and abutment on the Surrey side of the New Hungerford Market Bridge, now in progress. The hammers, or weights, or, as they are more usually called by pile-drivers, the "monkeys," are elevated to a height of thirty-five feet or thereabouts, along grooves in perpendicular leaders, by means of a locomotive steam-engine of ten horse power, fixed on a platform, on which the whole of the machinery is placed. The power of the blow given by each of these hammers exceeds 600 tons, and drives a pile of twenty-seven feet long, and as thick as the thickest piles used in embankments and for cofferdams, nearly its whole length into the earth in about eight minutes, or perhaps less. It drives two piles at the same time. A circular horizontal saw is worked by the engine, which in a few seconds cuts the tops of the piles even, and enables the trucks, or small wheels on which the platform is supported, to come forward as fast as the piles are driven, and cut them even at the top; the platform is propelled by a one-horse power by the engine. The power of this machine is absolutely astounding. It is an important application of steam-power, likely to produce very beneficial results in public works, in the formation of sea-banks, and in all operations on a large scale where rapidity of execution and precision are required. The machine was used in America for driving piles for railroads, and travelled by its own power upwards of two hundred miles, driving piles and making its own road through swamps and districts heretofore impervious. The machine has, moreover, the power of drawing piles out of the earth as quickly as it drives them in, and can be applied to the raising of blocks of stone and all heavy weights that require an extraordinary power.—*Standard.*

CAPTAIN CHARLES GRAY'S POEMS.

Captain Gray informs us, in the preface to an elegant volume entitled "Lays and Lyrics,"* that he has just retired from the marine corps, after a service of thirty-six years. A more cheerful soul or a gentler nature never went upon the half-pay list. He has thought proper to employ some of the first of his leisure in preparing a selection of the occasional rhymes of a lifetime, and pleasant lively verses they generally are—perhaps, in some instances, a little too Anacreontic for these sober times. Some of them are agreeable adaptations to the old melodies of Scotland; others are designed for new tunes. Another large portion of the Lays and Lyrics are of the character of *vers de societié.* We extract a specimen of both departments:—

WHEN AUTUMN HAS LAID HER SICKLE BY.†

When Autumn has laid her sickle by,
And the stacks are theekit to haud them dry;
And the sapless leaves come down frae the trees,
And dance about in the fitfu' breeze;
And the robin again sits burd-alane,
And sings his sang on the auld peat stane;
When come is the hour o' gloamin grey,
Oh, sweet is to me the minstrel's lay!

When Winter is driving his cloud on the gale,
And spairgin about his snaw and his hail,
And the door is steekit against the blast,
And the winnocks wi' wedges are firm and fast,
And the ribs are ryppet, the cannel a-light,
And the fire on the hearth is bleezin bright,
And the bicker is reamin wi' pithy brown ale;
Oh, dear is to me a sang or a tale!

Then I tove awa' by the ingle-side,
And tell o' the blasts I was wont to bide,
When the nichts were lang, and the sea ran high,
And the moon hid her face in the depths of the sky,
And the mast was strain'd, and the canvass rent,
By some demon on message of mischief sent;
Oh, I bless my stars that at hame I can bide,
For dear, dear to me is my ain ingle side!

CHRISTMAS.

A RUDDER-HEAD REVERIE.

In that famed place no longer cruising,
Where William kissed his "black-eyed Susan,"
Driven by the tide, toss'd by the breeze,
Rides our good ship, the Ramilies.
Others may "slumber on the ocean,"
But we've found out "perpetual motion;"
And things shall go a little hard,
If some one claims not the reward.
Some stomachs are so very nice,
Rolling upsets them in a trice;
And pitching gives them such a fit,
Poor souls! they cannot pick a bit!
Let winds pipe loud, let billows roar,
We eat and drink like folks on shore.
But what is this? As I'm a sinner
'Tis Christmas, and we've nought for dinner!
Already lour the distant skies;
The angry white-topp'd billows rise;
O'er head the rack is scudding fast,
And heavy moans the coming blast;
On flagging wing sails slowly by
The sea-mew, with a wailing cry.
What sad portentous signs are these?
How quick they turn our swans to geese!

Four jolly Mids have we invited,
Whose stomachs, no doubt, are delighted;
And shall their fondest wishes *go* out
Like candle-snuff? Shall then no *blow-out*
Delight the maws of hungry fellows?
Must *salt junk* fill our empty bellies?
Shall we have nought but beef and biscuit,
Instead of *soft tack*, fowl, and brisket?
Forbid it! Neptune's watery train,
That live below, or skim the main.

Alas! what will not patience teach;—
The surf is rolling on the beach;
And down comes Lapslie, hat in hand—
"At Deal, to-day, no boat can land!"
And all our hopes of Christmas fare
Vanish, like witches, in the air!
The rich sirloin, all smoking hot,
Like baser shin, has gone to pot:
The goose—oh, name it not!—the goose
Is killed and stuffed for others' use;
Or borne away, on ample pinions,
Regardless of our sage and onions.
'Tis clear our evil stars prevail—
We'll ne'er lay salt upon her tail.
The fowls have all been "bought and sold;"
The curry is too hot to hold!
The mince, so nicely baked in pies,
Is fruitless as a sailor's sighs,
When fast he scuds before the wind,
And leaves his lass and heart behind.
The ham, well dried a month before,
We only *smoke it* from the shore;
And, were we Jews of Abram's line,
On it might be allowed to dine;
But no—at distance here we stand,
And only view the promised land.
The veal—pray, messmates, do not frown—
Not it, but we, are quite *done brown:*
The tongue that tickles every palate,
Is mute within some butcher's wallet;

The pig on which I thought to dine,
Lies grunting with his fellow swine!
And greens uncut adorn the plain—
M———r may *green* for them in vain.
For such "good cheer" we may not look—
We all must dine with *Humphrey's Duke;*
Our Christmas gambols we have played till,
And danced to "Sandy lick the ladle!"
To bear with this is not in nature,
I therefore vote we *cob the cat'er.*

* Menzies, Edinburgh. † Music by P. M'Leod, Esq.

MAXIMS.

Never, unless you are an expert horseman, attempt to show off a spirited animal before your friends, else you may be made to kiss the dust; for the horse is a sagacious brute, and soon discovers the incapacity of his rider. Never sign an accommodation bill, for when once "on the *ice,*" it is impossible to predict the result. Never laugh at your own jokes, at least until the risibility of the company has been excited, when etiquette may perhaps permit you to give a gentle guffaw by way of accompaniment. Never, in talking to your next neighbour, vociferate as if you were "hailing a ship at sea;" it is the custom of uneducated boors, with whom you stand a chance of being identified. Never condemn your neighbour unheard, however many the accusations which may be preferred against him: every story has two ways of being told, and justice requires that you should hear the defence as well as the accusation; and remember that the malignity of enemies may place *you* in a similar predicament. Never, if you are in the habit of giving recitations, allow yourself, from the indiscreet and hyperbolical encomiums of friends, to suppose that you are a Roscius; and keep in mind that you may be flattered to be laughed at. Never get into a passion because others will not agree with you in opinion; you are not infallible, and moreover, diversity of opinion is the very life and soul of conversation; at the same time, we confess there are some dogmatists who never speak "rhyme nor reason," and who sadly try the temper. Never trouble others with the recital of your misfortunes: communications of this description are never pleasing; and, at all events, sympathy cannot counteract the decrees of fate; and, moreover, if you are given to such disclosures, you will be dubbed "knight of the rueful countenance"—a personage who is no favourite at convivial meetings, or, indeed, any where. Never refuse, if it be in your power, to aid the unfortunate; a generous act is always followed with a glow of happiness, far surpassing any mere animal gratification. Never harbour animosity towards a friend for a mere hasty expression; forgiveness is a godlike quality, and a true friend is so scarce a commodity, that he should not be repudiated on slight grounds; but those who injure you from "malice prepense," should be shunned as you would avoid a tiger.—*Edinburgh Observer.*

PEOPLE OF COLOUR AT BELIZE.

By this time I had twice passed the whole length of the principal street, and the town seemed in the entire possession of blacks. The bridge, the market-place, the streets and stores, were thronged with them; and I might have fancied myself in the capital of a Negro republic. They are a fine-looking race, tall, straight, and athletic, with skins black, smooth, and glossy as velvet, and well dressed; the men in white cotton shirts and trousers, with straw hats, and the women in white frocks with short sleeves and broad red borders, and adorned with large red ear-rings and necklaces; and I could not help remarking that the frock was their only article of dress, and that it was the fashion of these sable ladies to drop this considerably from off the right shoulder, and to carry the skirt in the left hand, and raise it to any height necessary for crossing puddles. On my way back, I stopped at the house of a merchant, whom I found at what is called a second breakfast. The gentleman sat on one side of the table, and his lady on the other. At the head was a British officer, and opposite him a mulatto; on his left was another officer, and opposite him also a mulatto. By chance a place was made for me between the two coloured gentlemen. Some of my countrymen, perhaps, would have hesitated about taking it, but I did not; both were well-dressed, well-educated, and polite. They talked of their mahogany works, of England, hunting, horses, ladies, and wine; and, before I had been an hour in Belize, I learned that the great work of practical amalgamation, the subject of so much angry controversy at home, had been going on quietly for generations; that colour was considered mere matter of taste; and that some of the most respectable inhabitants had black wives, and mongrel children, whom they educated with as much care, and made money for with as much zeal, as if their skins were perfectly white.—*Stephens's Incidents of Travel in Central America.*

SUPERSTITION IN THE NINETEENTH CENTURY.

A lad, about eighteen years of age, on Wednesday night, a few weeks ago, disappeared under strong excitement; and it is supposed threw himself off the bridge at Melksham, into the Avon, and was drowned. To recover the body, his friends on Saturday were firing a gun along the banks of the river, believing that the report would burst the caul and raise the corpse to the surface. On Monday, they beat a drum along the bank, believing that the drum would cease sounding when opposite the corpse! Of course, both methods failed.—*Newspaper paragraph.*

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 523. SATURDAY, FEBRUARY 5, 1842. PRICE 1½d.

THE STORY OF A PICTURE.

In the year eighteen hundred and something, Henry Cummins awoke one morning and discovered—what very much surprised "the world" when they heard it, and almost astonished himself, namely—that he was penniless! In three years he had run through the savings of a life; for his father, a plodding man of business, had bequeathed above thirty thousand pounds to his only child, having previously given him what is called "a good education"—a term which is, alas! too often a sad misnomer. What is commonly called a "good" education, sometimes turns out to have been a very "bad" one. Although a tradesman, old Mr Cummins had an amiable weakness (if weakness it must be called), yclept family pride, and his anxious hope was, that Henry would resuscitate the honour of the family. Yes, he belonged to a family which had been renowned through several generations; but as virtue and honour do not always fill the purse, and as in this unromantic age it is found absolutely necessary to pay butchers and bakers, it was thought advisable for a younger branch of the genealogical tree to strike fresh root in the plebeian but extremely invigorating soil of trade. Mr Cummins had been the younger branch destined for this healthful process, and Henry had been intended for the bar, the father's dreams of course picturing him on the woolsack. But a lavish allowance for his pocket, and the gratification of every wish not absolutely vicious, while yet in his teens, were not precisely the means to render him a steady or a studious man. He was twenty when his father died, and he came into uncontrolled possession of his property a year afterwards; so, considering that he found it quite impossible the first year to live on four times the sum that his trustee allowed him, and that he did contrive, and not very mysteriously, to borrow some thousands during that period, it is not surprising that at the end of three years, as we have said before, he awoke one morning and found himself without a penny. He made other discoveries, too, at the same moment. He found that, paying the price of his whole fortune, he had not, after all, purchased happiness; and when the first stunning sensation of extreme *un*happiness and affliction which his different discoveries occasioned had a little abated, there sprung up in his mind a wonderful growth of good resolutions for the future, and some sort of inward assurance, which was better than all, that told him he had energy enough to carry them out.

But the question was, what first should be done? After a little while, all visionary plans and speculations melted into the one strong sense of the necessity of selling at once horses and carriages, house, furniture, and every species of available property, with the proceeds of which he hoped to discharge debts still outstanding, and have perhaps a trifle to begin the world with. Now, abstractedly, a chair is but a chair, a table but a table, yet every one will allow the power that even inanimate objects possess of twining themselves around the heart, until a final separation is absolutely painful. Henry Cummins was perfectly aware of this fact, as on the morning of the sale he walked through every room of his house, for the last time, among his household gods. There they were, every one ticketed, and standing uncomfortably forward, as if they had already taken leave of their master, and were inviting themselves to the notice of the strangers who walked through the rooms. Had the weather been dull and cloudy, nature would have seemed in unison with the spendthrift's feelings; but the sun streamed in most unsympathisingly, as if to mock his anguish, and (what perhaps he also observed) to throw a very unbecoming degree of light upon faded damask, cracked china, and tarnished gilding. It is possible that he might have given a rough guess at the different prices which might have been expected had a cloudy sky veiled such imperfections, yet it was not that which made his cravat feel something too tight, or produced the nervous twitches which might have been remarked about his mouth; for though tears—those exhalations of intense agony, a *man's* tears—did rise to his eyes, pride drove them back. It was very strange that his father's arm-chair, or his mother's work-table, should produce such emotions, and yet they oppressed his heart most strongly when he observed a stranger pause, with all the assurance in the world, to examine a certain old picture. Now, it chanced that this was about the only thing to which the sunshine was favourable, for, without streaming upon it, a flood of light nevertheless illumined the apartment, and, coming from the right direction, brought out beauties that might otherwise have remained unobserved.

It was, indeed, an exquisite painting—no matter by which of the old masters; and it had belonged to the Cummins' family for several generations. It was a landscape scene with figures; the season bright gorgeous summer; and the picture was among Henry Cummins' earliest recollections and associations. In the days of frocks and pinafores he had played before it, looking up sometimes, and almost wondering if the shadows would ever grow longer, or the knot of harvest people ever finish the day's labour. And in years later than those of frockhood, he had tried his daring hand in copying the great original, only, it must be confessed, to throw palette and brushes away in disgust; and in recent times he had pointed out its beauties to admiring visiters, while it had been the silent witness of his follies—silent, surely, because he would not listen, for now to the mind's ear it spoke trumpet-tongued reproaches. There it hung, in its old-fashioned frame, ticketed No. 27. Had that ticket supernatural powers?—for, verily, to the vision of Henry Cummins, the figures seemed starting to life, as they looked down sorrowfully and reproachfully at him. The stranger, whose glance the picture had arrested, was a little old gentleman, dressed in brown, who held by the hand a beautiful girl of about twelve years old. The fairy-like child was soon satisfied with looking at the picture, and slipped her hand from that of her grandfather, the better to observe a China monster, which had caught her attention; and then the little old man drew out his spectacles, stepped somewhat nearer to the painting, and putting his arms behind his back, and clasping with one hand the wrist of the other, stood for full five minutes in a dream of delight. He was aroused from it by a joyous laugh of the child, for the grotesque image had been irresistible. The child's laugh grated on the heart of Henry Cummins almost as much as the bright sunshine had done; and though he gazed at her full in the face, as she shook back the thick curls which shaded it, and besought "grandpapa" to buy the green and purple monster, he certainly did not perceive she was the most beautiful object in the room—if the truth must be told, he thought her a noisy troublesome child.

The little old gentleman promised to buy the monster, and telling Julia that the sale would commence in half an hour, he led her down stairs, and put her into a carriage which was waiting, and which quickly drove off. All this Henry Cummins beheld from a window, though he could not hear what directions were given to the coachman. However, in another minute the little old gentleman had returned to the drawing-room, but he passed by the picture without noticing it again, and after giving rather an indifferent glance to some other objects, seated himself within a few paces of the auctioneer's desk. Henry Cummins wondered if he meant to bid for the picture, and felt almost decided to buy it in himself; but he did not wish to make himself known to the auctioneer, and so determined to bid as a stranger. The sale began, and the china monster, which was in the first page of the catalogue, was knocked down to the little old gentleman. It had been run up to a sum far beyond its value, for the purchaser had shown he was determined to have it. Perhaps he took a hint from this circumstance, or, perhaps, he was in reality an experienced bidder, and had only from some accident been off his guard in a trifling matter; however this might be, when the picture was put up for sale the old gentleman's voice was not heard at all. It is true the auctioneer must have received, from time to time, telegraphic dispatches from somebody, as, without the bidders being always heard, "going—going"—was followed by higher and higher offers. At last, as if himself out of patience, the auctioneer sharply let fall his mystical symbol, even before Henry Cummins could determine on an advance, and a nod of the head proclaimed that the picture belonged to the little old gentleman. He looked remarkably happy, for he would willingly have given hundreds for that which he had purchased for thirty-five pounds. Once more he approached the painting, gazing now with a sort of parental admiration; but this time Henry Cummins was at his elbow. A quick beating of the heart had superseded the thickness in his throat as the latter exclaimed—"Sir, I will give you twenty pounds for your bargain!"

"Sir, I would not take fifty," returned the other.

"What will you take?" rejoined Henry.

"Nothing you can offer. Sir, I mean to keep the picture;" and the old gentleman clasped his arms behind his back, in his favourite attitude of determination.

"I was deputed by Mr Cummins," exclaimed Henry, after a moment's pause, "to buy in this painting; it is much prized by him, having many old family associations, and at the last moment he repented having offered it for sale. You would not have had it, sir, had the auctioneer been a second less quick in his decision."

"Lucky for me, lucky for me, that he was so sharp; and I have nothing to do with the repentance of such a young scapegrace as Mr Henry Cummins."

"Do you know him, sir?"

"Enough to know that the picture is much safer in my possession than in his. I suppose he is going to turn shoe-black, or something of that sort; he can't be fit for any thing better, I should think."

"They say he is going to India—a friendless, moneyless adventurer."

"Eh! what!—well, it is never too late to reform; but I can't let him have the picture for all that. Good morning, sir; my carriage is waiting"

There are mysterious chords in our nature, which trifles may sometimes awaken to the holiest purposes; and the feelings which this incident drew forth formed the key-stone to the strong arch of Henry Cummins' good resolutions—an arch which spanned his future life. He had hitherto, like thousands of young men in similar circumstances, lived a life of pure heedlessness—taking no thought of the morrow—ignorant of the value of money—and concerned only in the paltry and fleeting enjoyments of the senses; but while his long, and fond, and earnest farewell gaze rested upon that picture, he understood, for the first time, that we have duties in this world to perform, beyond mere

enjoyment or the maintenance of one's own existence, and he turned away calmer, more collected, almost happier, than he had felt for many a day.

Ten years passed away, bringing about their strange revolutions; ripening youth to manhood, and tainting the pride and vigour of maturity with decay—sweeping many a loved one from our hearth, but weaving fresh ties around the heart, as a ruin that is supported by the sweet young flowers which twine there; and yet the older we grow, the more stubborn are such tendrils, though, if they do enwreath themselves, it is with ties that can scarcely be severed. Ten years, then, working their wondrous changes, had passed away, when, on a bright sunshine morning, a stranger arrived at one of London's regal-looking hotels. He was a passenger from India, by the good ship Ariel, and there came in his train a due proportion of those ponderous packages and chests with which the Anglo-Indians very properly encumber themselves—perhaps as containing a sort of ransom money with which to buy back the regard and affection of which absence may have robbed them. The stranger at the ——, however, had few friends in England, although he brought home several chests; one especially the *cognoscenti* would have selected at a venture, as containing the most precious deposits, though its solid black leather exterior might have seemed unpretending to the inexperienced. Now, if the truth must be told, the stranger had returned to England for three especial reasons; two will be told presently, the other was to find a wife. Whether he was of opinion that, as second-rate goods are manufactured for exportation, so, speaking generally, they are not first-rate *parties* which find their way to the Indian market of matrimony, the chronicle of his life declareth not, though the fact of his not having "suited himself" while abroad, would suggest the idea that he might be a little fastidious, and that, although a successful man of business, and a thorough man of the world, there might still exist in his mind a belief in the divinity of love—call it, if you will, a vein of romance, but in some natures it can never be worked out, and does almost ever exist with the loftiest order of minds. Well, then, the "black chest" contained gifts for this imaginary being—for, of course, she would be worthy to be robed with the delicate filmy muslins of Dacca (fit for Titania and her court), or to move beneath the graceful folds of the soft and peerless Cashmere.

But we must return to the little old gentleman, mentioned long ago. Ten years seemed to have passed him by with a very slight and friendly greeting. There sat Sir James Howard, so very like his former self that one might have fancied the suit of brown he wore was the identical apparel alluded to before; perhaps a very keen observer might have remembered that, ten years ago, there were a few dark hairs amid the snow-drifts of time, whereas now all were white; perhaps, too, his habitual stoop was a little more remarkable, and his hand (that great test of age) a little more wrinkled; but the bright, intelligent, good countenance, seemed just the same as ever. His house was a short distance from London, and he sat in a favourite morning room, the walls of which were decorated with gems of art; books, also, were there, not *too* formally arranged; and the French windows opened into a flower-garden, admitting the summer breeze laden with sweets. A servant entered with the card of "Mr Henry Cummins," and Sir James desiring him to be admitted, the stranger entered the room. Simultaneously with offering his apologies for intruding, the latter glanced round the apartment, while an anxious expression gathered upon his countenance.

"I fear, Sir James, I am scarcely remembered," exclaimed Henry. And Sir James put his finger to his brow as if to invoke recollection, before he replied, "The name is familiar to me, though I cannot exactly tell how."

"You—you—Sir James, you purchased a picture that once belonged to me."

"You! Are you *that* Mr Cummins?" rejoined Sir James, eyeing his visiter from top to toe, with a look that plainly indicated he remembered Henry's early career, and the circumstances which had led him to predicate that the "scapegrace" must turn shoe-black. That could not have been the occupation of the gentlemanly, indeed distinguished-looking, person now before him; and Sir James recollecting, with the lightning flash of thought, every particular connected with the sale, gave a shrewd guess at the object of Henry Cummins' visit, and—grew a little out of temper. Yes, as faithful historians, we must confess he felt cross; for, as the sun has spots, so the dear, good, little, old gentleman had one fault—he was, on particular subjects, of an irritable temper. The picture he still retained, and prized highly. Inclination was at war with the promptings of his own kind, warm, fresh, evergreen heart, and the more the former succumbed, the more peevish in manner did he grow.

It is almost needless to hint that the object of Henry Cummins' visit was to regain it at any pecuniary sacrifice. He was a proud young man, and yet he bore the reproaches with meekness which Sir James could not help insinuating, and owned his errors frankly. "I can assure you, Sir James," he said, "when I sought for and accepted a situation in India from an old friend of my father, it was with the most anxious desire to redeem past errors—errors which, I may take leave to say, were of the heart not of the head; and in all my exertions in that distant field of enterprise, I was not less animated by repentant feeling than by the hope and belief of regaining the picture which fortune had made yours; in short, *that* picture has been the soul of my reformation. I am now blessed with the means of independence; and here, then, I appear with the wish to gain back the object of my long-cherished desires."

Sir James was not unmoved by the ingenuous appeal; but he was inexorable. Henry, in some respect, felt himself to be ill-used; yet of what should he complain? Surely, a man has a right to retain the purchase he has lawfully made. Although continuing obdurate to all offers, Sir James had the condescension to ask his visiter to walk into the drawing-room to look at the picture. Henry followed, trembling; for while it was unredeemed, he felt the painting would gaze upon him like a reproving spirit. There it was, in the centre of one side of the room, and provided with a new and gorgeous frame; the light, too, was most favourable. What memories did it bring back to the spendthrift's mind! His mother's gentle touch, her loving kiss—his father's counsel—the voices of early friends—and the forms of all—and scenes of long, long ago—seemed vividly to pass before him. Like the buried cities which lay for centuries at the volcano's foot, so there are thoughts and feelings which rest entombed beneath, not destroyed by, the lava ashes of time and circumstances. To his heart and fancy the figures did not look at him reproachfully as he had expected them to do, but seemed to wear an expression more of sorrow than of anger, and he felt that he would have given much to be alone with the picture for an hour, for Sir James stood by him, with his arms clasped behind as formerly, muttering audibly, "No, I will never sell this picture."

Poor Henry was summoning his courage for the leave-taking, and gazing like a lover at a mistress who could never be his, when a joyous laugh, evidently proceeding from the adjoining room, fell upon his ear; it jarred upon his spirits, and seemed almost as discordant as that he well remembered ten years before. The voice and laugh were peculiar, and he felt certain the tiresome child was near. Of course, a moment's thought convinced him that the child must be now a woman; but he felt almost sure she had red hair, had a strong impression that she squinted, and associated her as well, in some incongruous manner, with a laughing hyæna. One more appeal before he departed; it was this:—"Sir James, if I survive you, will you direct your executors to sell me the picture? or will you give me the power, in case I should die first, of willing it into my family, by any pecuniary arrangement with my heirs and yours which you may like to make?"

"Well, perhaps, it may be yours after my death."

And so they parted.

Poor Henry Cummins returned to his hotel vexed and disappointed. He had taken the precaution of leaving his address with Sir James, in case the latter should change his mind, which did not, however, appear a very probable event. Out of spirits, and perhaps a little out of humour, the day dragged wearily on. In the evening he strolled out for an hour, and bethought himself of walking down the street in which was his former home. The old house, which he had left bare and tenantless, was now lit up for a party; it seemed as if every thing that day were destined to assume an uncongenial unsympathising air; and he bent his steps homeward more desponding than ever. On his arrival he found a huge packing case in his apartment, and a note from Sir James Howard. The eccentric old gentleman kept his word—he did not *sell* the picture, he *gave* it to a reformed spendthrift! Yes, there it was, and in the old frame too. To be sure, some people might have hinted that the handsome one was reserved for another favourite, but they would have done Sir James injustice. He knew human nature well, and he knew that the kindly feeling displayed in the preservation and recollection even of an old picture-frame would not be lost on the heart of Henry Cummins.

Our space forbids us to describe minutely Henry Cummins' second visit to Sir James Howard; how the cheerful aspect of the different apartments failed now to oppress or deject him; or how even a certain laugh seemed musical. But the second visit was not the last, for the reformed spendthrift had won an eccentric but sincere and lasting friend. He was introduced to Julia, and assuredly there was nothing about her to recall his former unfavourable impression. Her eyes were as straight as his own (and *they* were rather handsome ones), but of the deep blue of a violet, and her hair of that sunny brown that even "an enemy" would call auburn. They became intimate, and Henry grew to delight in the rich voice and joyous laugh; and Julia had a heart, and could weep sometimes:

> "For the heart which is soonest alive to the flowers,
> Is always the first to be touched by the thorns."

One day he sat beside her at the piano, and remarking (not for the first time) that her hands were whiter than the ivory, he bethought him of a certain diamond which was in the "black chest" among other unset gems, and he was sure it could never find so fit a home as on one of those snowy fingers. It was presented—accepted; and as the chest was opened, he found, among other half-forgotten treasures, an ivory work-box, looking as if it belonged to her; there was room for her name on it, and he thought of having Julia Howard engraven, but he recollected she might marry, and so the blank space remained. In another week some other thought caused the black chest to be again inspected; but when he came to close it, the contents had been so much disturbed, that without removing an embroidered cashmere, the lid *would* remain obstinately gaping. He took out the cashmere, paused for a moment, smiled, as if some agreeable thought occurred for the first time—and—and Decea muslins, cashmeres, boxes, fans, card-cases, attar, chains, rings, unset diamonds, &c. &c., found but one mistress. In less than three months from that day, more pretty things than one were engraved—Julia Cummins. Thus were two of the ardent wishes of Henry Cummins accomplished, and the third was in his own power to fulfil. Although the career in India, which had blessed him with an ample fortune, had unfitted him to pursue the study of the law, he understood that *conduct* sheds as much lustre on a family as the display of *talents: that* was in his power; and if vanity is sometimes pained by the recollection of the name he might have won, he owns that the punishment is just, though, while he regrets the past, he feels gratefully happy that he has redeemed it. So true is it that "there is a future to all who have the virtue to repent and the energy to atone."

CATACOMBS OF PARIS.

The origin of the great catacombs, or receptacles for the dead, attached to the French capital, is in every point of view curious and interesting. Previously to the latter end of last century, the burial-places of the city were in a condition at once disgusting and destructive to human health. One of the early French kings had bestowed a piece of the royal suburban grounds on the inhabitants as a place of interment; and this spot, the site subsequently of the church of the Innocents, continued for nine or ten centuries to serve as the sole or principal receptacle for the dead in Paris. Not only was this the case, but the cemetery was also applied to its purposes in a manner unusually dangerous. Large pits were formed, each about thirty feet deep and twenty feet square, and into these coffins were lowered, one tier above another, without any intervening earth, until the pits were filled. Each was then covered with a thin layer of soil. The common number of bodies cast into every excavation amounted to from twelve to fifteen hundred; and, in the thirty years preceding 1780, nearly ninety thousand bodies had been thus deposited in the charnel-holes of the Innocents. Once in every thirty or forty years, it had been customary to execute the frightful task of opening and emptying these pits; but, in the case of great numbers of the older ones, this task had long ceased to be fulfilled, and they accordingly remained unmoved, though so choked up with the matter of corruption as to rise above the level of the adjoining streets, and seriously to affect the air in the ground-flats of the houses. It was supposed that, from the time of Philip Augustus, more than 1,200,000 bodies in all, had been interred in the cemetery of the Innocents; and as the mouldering bones, even when the pits were cleaned out, were merely conveyed to an arched gallery surrounding the burial-ground, it might be said that some portion of all that had ever lain there still remained.

When all men of science and sense were beginning to recognise the necessity of remedying this evil, another cause of peril and alarm chanced to agitate the city of Paris; but, fortunately, the one was found capable of serving as a remedy for the other. Quarries of stone had been opened in the immediate vicinity of Paris at an early period of its history, and had been wrought to a large extent in the course of successive ages, to supply materials for the increasing city. In consequence, a vague notion existed among the inhabitants, that the city was considerably undermined. Little attention was paid to the matter till 1774, when some alarming shocks and falls of houses aroused the fears of the government. A regular survey took place, and the result was the frightful discovery, that the churches, palaces, and almost all the southern parts of the city of Paris, rested upon immense irregular excavations, and stood the greatest risk of ere long sinking into them. A special commission was immediately appointed to take the proper steps for averting such a catastrophe; and the necessity of such a commission was made strikingly apparent on the first day of its operations, by an accident in the Rue d'Enfer. A house in that street sunk down in an instant, eight-and-twenty metres below the level of its court-yard.

When all the labyrinths of the quarries were inspected, and plans taken of them, the alarm of the Parisians was far from being abated. Every quarrier had habitually worked, it appeared, where he chose or where he could; and, in many cases, excavation was found *below* excavation, the whole running to almost interminable lengths, while the pillars that had been left were found in almost all cases to be totally insufficient to bear permanently the enormous weight above. In various instances, the roof had sunk considerably, and in others, large masses had actually fallen, rendering it almost marvellous that the city should not long before have become a mass of ruins. The great aqueduct of Arcueil, which passed over this scene of hidden peril, had in reality suffered some shocks, and if the risk had not been timeously discovered, it can scarcely be doubted that the ultimate issue would have been the charging of the quarries

with water and the sapping of the city. The commission began its work of cure, aided by a very large body of workmen. Great pains were taken in cutting galleries from labyrinth to labyrinth, to ascertain the extent of the mischief, and in vaulting and propping every part that seemed to require such support. The extent of the quarries, however, rendered the labour gigantic, and, long ere matters were permanently put in order, the happy idea of converting these excavations into receptacles for the refuse of the charnel-house of the Innocents, had occurred to M. Lenoir, the inspector of the city police. The suggestion was made public, and approved of by the Council of State, who, in 1785, decreed the opening of the charnel-pits of the Innocents, and the removal of the bones of the dead to the quarries. The first step was to make an entrance into the quarries by a flight of seventy-seven steps, and to sink a shaft from the surface, down which the relics of mortality might be thrown. At the same time, the workmen below walled off that portion of the excavation designed for the great charnel-house, and properly supported the roof. On the 7th of April 1786, all the preparations being completed, the new catacombs were consecrated with much solemnity, and on that same day the work of removal began. Bones and partially preserved coffins were brought by night to the shaft in funeral cars, followed by robed priests chanting the service for the dead. The nature of the task, the glare of the torches, and, above all, the hollow rattling and echoing of skeletons, bones, and broken wood, in their fall down the shaft, sent back as the sounds were by the vaults below, rendered the whole scene peculiarly impressive and awful.

But the relics of human beings, in their ordinary condition, were not the most remarkable part of the materials transferred from one site to another on this occasion. The pits of the Innocents exhibited immense masses of the soft white substance called *adipocire*, into which the bodies had been converted, and which had been noticed under similar circumstances at former periods. Adipocire had some of the mingled qualities of wax and tallow, being capable of use in the manufacture of candles. Respect, however, for what had once been the human body, of course dictated the consignment of the masses of adipocire found in the pits of the Innocents, to the new catacombs under the Plaine de Mont-Rouge.

The catacombs of Paris received in succession the contents of the smaller cemeteries of Saint-Eustache and Saint-Etienne-des-Gres, after those mentioned. There, too, the victims of the revolution found a ready and roomy abode; and when the popular fury demolished a number of the churches, the bones lodged in them after the old fashion were removed to the same great receptacle. Between 1792 and 1808, the catacombs received the exhumations of twelve other minor cemeteries in and around Paris. Between 1808 and 1811, new excavations, made in the cemetery of the Innocents for the passage of a canal, rendered it necessary to convey a large quantity of additional relics to the catacombs; and a few other churches and cemeteries were emptied into them in the course of the next few years. Having thus made use of the quarries, and poured into them in all an immense quantity of human remains, the Parisians did not adopt the catacombs, as perhaps they might wisely have done, as their general burying-place. On the contrary, they created various new cemeteries above ground, though under comparatively excellent regulations, as the famous Père la Chaise and Montmartre sufficiently testify.

The revolutionary disturbances impeded the operations still requisite to render the vast quarries and catacombs of Paris stable and safe. The ordinary vaults became, consequently, full of cracks, water filtrated through the roofs, and fresh downfalls seemed impending. The air was rendered noxious by the want of circulation. In 1810, M. de Thury, the architect, began to make new repairs. He built new pillars, and formed channels for removing the water. Air was introduced simply but effectively, by luting the upper half of a broken bottle, with the neck outermost, into the wells which supply the houses above with water, and which had been made to descend through the quarries to the ground below, like so many round towers. By uncorking these bottle-necks, air is let in at will. As regarded the catacombs, the bones lay in heaps thirty yards high in some places, and the workmen had to make galleries through them, and pile them along the walls in regular order. Such as exhibited disease were arranged into an osteological cabinet. In short, order and security were, for the first time, truly introduced into the arrangements of this subterranean world.

The catacombs of Paris remain, generally speaking, nearly in the same condition as left by M. de Thury, though various minor improvements have been added, to render the place more interesting to visitants. Three staircases, of which the best known is that of the *Barrière d'Enfer*, conduct the modern visiter into the vaults. On entering, a black line is to be noticed traversing the centre of the passages, and forming a guide through them, which the most familiarised visiter cannot safely neglect. On the right and left of the first gallery, that of the Rue St Jacques, several others are seen stretching away under the plain of Mont Rouge. The visiter cannot penetrate far, until he sees startling marks of the fall of rocks, and beholds stalactites hanging down in abundance from the walls. In the gallery under the street St Jacques, is also seen the great aqueduct of Arcueil, with its supporting columns. By various sinuosities, the visiter arrives at the gallery of Port Mahon, so called from a sculptured view of the taking of that fort executed by Decure, an invalid soldier. He perished there by a fall of the rocks, while the chisel was yet in his hand. A fountain was here discovered by the workmen, and a basin made for their use, with a small subterraneous aqueduct. It was first called the Well of Lethe, and was inscribed with a couplet from Virgil; but a Scriptural quotation, more appropriate to the place, now marks its site—"Whosoever drinketh of this water, shall thirst again; but whosoever drinketh of the water I shall give him, shall never thirst; but the water that I shall give him, shall be to him a well of water springing up into everlasting life." It contains a few gold-fish, which seem to bear that dark abode very well, as we find them mentioned by visiters both of 1818 and 1832. A few other inscriptions are to be found here, such as Dante's famous line—

"Leave hope behind, all ye who enter here."

A fire is also kept burning, in an antiquely-shaped vase, to purify the air of the vaults.

A mineralogical collection of some interest has been formed from the various strata composing the sides of the galleries. But the most interesting collection here is the Museum of the Dead. On approaching the catacomb galleries, the visiter finds the vestibule to be in the form of an octagon. Its gate is flanked by two pillars, and is inscribed above with some lines of poetry. The interior of the catacombs is arranged with propriety and decorum. The crypts holding the divisions of piled bones have each of them different names, some of which are appropriate, others absurd. There is the crypt or niche of Eternity, for example, that of Death, and that of the Resurrection, each marked by corresponding inscriptions. There is also a niche for the victims of the Revolution, with some Latin lines above, which may be rudely Englished—

"These, when fierce Discord had usurp'd the throne,
Prompter of crimes—and law and right were scorn'd—
By bloody ruthless men were done to death."

Among the inappropriately named crypts may safely be reckoned those to which the names of Ovid, Anacreon, and some others, have been applied. An album, as might have been anticipated, is among the other appendages of the catacombs.

The other galleries of these great excavations need not be named or described in detail. One general feature marks them all, and it is worthy of mention, as reminding us most forcibly that these vaults are not simple objects of curiosity, or to be thought of merely as pleasant spectacles, but are to be lamented as the possible sources of calamity and ruin to the great city under which blind neglect allowed them to be formed. Constant attention to them is imperatively demanded to secure the safety of the capital of France, and the provision adverted to consists in every subterranean street being numbered precisely like the one occupying the ground above. This is necessary in order to apply new supports, on the slightest indication of danger, to the exact point where they are required.

CATLIN'S WORK ON THE NORTH AMERICAN INDIANS.

Of all the works yet published on the subject of the aboriginal inhabitants of North America, no one, it seems to us, can be compared in point of accuracy and extent of research with that of Mr George Catlin, newly reprinted in Great Britain from the American edition.* A surprising amount of time and labour has been devoted by the author to the collection of materials for his task. Born on the banks of the Susquehannah in Wyoming, Mr Catlin was originally set to the study of the law; but, unable to resist the strong bent of his genius, he turned aside from the legal profession, and became a painter in Philadelphia. A few years afterwards, a deputation of noble-looking Indians came to the city, and made so deep an impression on his fancy, that he resolved not only to visit these "beautiful models" of the human form in their native wilds, but also to devote his lifetime to the task of illustrating, by pictorial representations, the history and customs of this people, destined, it would seem, to be known to future ages only by such records, timeously formed. Sacrificing to this great object the society of a beloved family, and all the comforts of home, Mr Catlin set out in 1832 for the Upper Missouri, with the fixed resolve that nothing short of the loss of life should prevent the full completion of his purpose. In the course of the succeeding *eight* years, he traversed North America almost from end to end, saw and mixed with forty-eight Indian tribes, composing a large portion of the two millions of red people yet in existence, examined personally into all their peculiarities, and, finally, accumulated a noble gallery of portraits and a rich museum of curiosities, calculated to form at once a lasting monument to himself, and an invaluable record of Indian persons, manners, and habiliments.

This is a long exordium, but Mr Catlin, combining all the qualities of the traveller, artist, and historian, merits no sparing notice. His two volumes, large octavo, and closely printed, are full of most interesting matter, and contain, besides, not less than *four hundred* beautiful illustrations, engraved from the original paintings. From the large stores of varied matter which Mr Catlin presents to us, we shall take leave to lay before the reader, in the first place, one of the author's experiences as a wandering traveller. He was one day riding across an Upper Missouri prairie, where the grass is seven or eight feet high, with three companions, one an Indian guide of the name of Pah-me-o-ne-qua, or the *red thunder*. Three of the party sat down to their mid-day meal, but the Indian stood aloof, sad and thoughtful. "This is the plain of *fire grass*," said he, "where the fleet-bounding wild horse mingles his bones with the red man, and the eagle's wing is melted as he darts over its surface." Notwithstanding these ominous words, after gazing long around, he gracefully sank down on the grass, and his relieved companions chatted cheerfully by his side. But on a sudden "Red Thunder was on his feet—his long arm was stretched over the grass, and his blazing eyeballs starting from their sockets. 'White man,' said he, 'see ye that small cloud lifting itself from the prairie?—he rises! the hoofs of our horses have waked him! The Fire Spirit is awake—this wind is from his nostrils, and his face is this way.' No more; but his swift horse darted under him, and he gracefully slid over the waving grass as it was bent by the wind. Our viands were left, and we were swift on his trail. The extraordinary leaps of his wild horse occasionally raised his red shoulders to view, and he sank again in the waving billows of grass. The tremulous wind was hurrying by us fast, and on it was borne the agitated wing of the soaring eagle. His neck was stretched for the towering bluff, and the thrilling screams of his voice told the secret that was behind him. Our horses were swift, and we struggled hard; yet hope was feeble, for the bluff was yet blue, and nature nearly exhausted. The sunshine was dying, and a cool shadow advancing over the plain. Not daring to look back, we strained every nerve. The roar of a distant cataract seemed gradually advancing on us—the winds increased, the howling tempest was maddening behind us—and the swift-winged beetle and heath hens instinctively drew their straight lines over our heads. The fleet-bounding antelope passed us also; and the still swifter long-legged hare, who leaves but a shadow as he flies. Here was no time for thought; but I recollect the heavens were overcast—the distant thunder was heard—the lightning's glare was reddening the scene—and the smell that came on the winds struck terror to my soul. * * * The piercing yell of my savage guide at this moment came back upon the winds; his robe was seen waving in the air, and his foaming horse leaping up the towering bluff.

Our breath and our sinews, in this last struggle for life, were just enough to bring us to its summit. We had risen from a *sea of fire!* 'Great God!' I exclaimed, 'how sublime to gaze into that valley, where the elements of nature are so strangely convulsed!' Ask not the poet or painter how it looked, for they can tell you not; but ask the naked savage, and watch the electric twinge of his manly nerves and muscles, as he pronounces the lengthened 'Hush—sh—,' his hand on his mouth, and his glaring eyeballs looking you to the very soul.

I beheld beneath me an immense cloud of black smoke, which extended from one extremity of this vast plain to the other, and seemed majestically to roll over its surface in a bed of liquid fire; and above this mighty desolation, as it rolled along, the whitened smoke, pale with terror, was streaming and rising up in magnificent cliffs to heaven.

I stood secure, but tremblingly, and heard the maddening wind, which hurled this monster o'er the land—I heard the roaring thunder, and saw its thousand lightnings flash; and then I saw behind the black and smoking desolation of this storm of fire."

Another adventure, illustrative of life on the prairies, occurred to Mr Catlin when travelling alone. Alarmed at the violence of an epidemic at Fort Gibson on the Arkansas, he resolved to leave the baneful spot, and ride across to the Missouri, over a nearly desolate tract, five hundred miles in breadth. Though much dissuaded, he started on his journey, with no companion but his old friend *Charley*, a clay-hued horse of the Camanchee wild breed. After twenty-five days of perfectly solitary travelling, Mr Catlin had an adventure when he rested for the night. "I generally halted on the bank of some little stream, at half an hour's sun, where feed was good for Charley, and where I could get wood to kindle my fire, and water for my coffee. The first thing was to undress Charley and drive down his picket, to which he was fastened, to graze over a circle that he could describe at the end of his lasso. In this wise he busily fed himself until nightfall; and after my coffee was made and drank, I uniformly moved him up, with his picket by my head, so that I could lay my hand upon his lasso in an instant, in case of any alarm that was liable to drive him from me. On one of these evenings when he was grazing as usual, he slipped the lasso over his head, and deliberately took his supper at his pleasure, wherever he chose to prefer it, as he was strolling around. When night approached, I took the lasso in hand and endeavoured to catch him, but I soon saw that he was determined to enjoy a little freedom; and he continually evaded me until dark, when I abandoned the pursuit, making up my mind that I should inevitably

* Letters and Notes on the Manners, Customs, and Condition of the North American Indians. By George Catlin. London: Published by the Author at the Egyptian Hall. 1841.

lose him, and be obliged to perform the rest of my journey on foot. He had led me a chase of half a mile or more, when I left him busily grazing, and returned to my little solitary bivouac, and laid myself on my bear skin, and went to sleep.

In the middle of the night I waked, whilst I was lying on my back, and on half opening my eyes, I was shocked to the soul, by the huge figure (as I thought) of an Indian standing over me, and in the very instant of taking my scalp. The chill of horror that paralysed me for the first moment, held me still till I saw there was no need of my moving—that my faithful horse Charley had 'played shy' till he had filled his belly, and had then moved up, from feelings of pure affection, or from instinctive fear, or, possibly, from a due share of both, and taken his position with his forefeet at the edge of my bed, with his head hanging directly over me, while he was standing fast asleep."

Intending to take another glance at the comprehensive contents of these volumes, we shall go on with extracts taken almost at random on the present occasion. Reaching the country of the Camanchees, on the upper parts of the Red River, he found this large tribe to be one of those whom the introduction of horses by the Spaniards had totally altered in character and position. Great troops of wild horses, small, but strong and delicately limbed, traverse the prairies here, and the Camanchee almost lives in the saddle. He wars on horseback, and his main sports are equestrian. "Racing horses, it would seem, is a constant and almost incessant exercise, and their principal mode of gambling; and, perhaps, a more finished set of jockeys are not to be found. The exercise of these people, in a country where horses are so abundant, and the country so fine for riding, is chiefly done on horseback; and it 'stands to reason,' that such a people, who have been practising from their childhood, should become exceedingly expert in this wholesome and beautiful exercise. Amongst their feats of riding, there is one that has astonished me more than any thing of the kind I have ever seen, or expect to see, in my life; a stratagem of war, learned and practised by every young man in the tribe, by which he is able to drop his body upon the side of his horse at the instant he is passing, effectually screened from his enemies' weapons, as he lies in a horizontal position behind the body of his horse, with his heel hanging over the horse's back—by which he has the power of throwing himself up again, and changing to the other side of the horse, if necessary. In this wonderful condition, he will hang whilst his horse is at fullest speed, carrying with him his bow and his shield, and also his long lance of fourteen feet in length, all or either of which he will wield upon his enemy as he passes; rising and throwing his arrows over the horse's back, or, with equal ease and equal success, under the horse's neck. This astonishing feat, which the young men have been repeatedly playing off to our surprise as well as amusement, whilst they have been galloping about in front of our tents, completely puzzled the whole of us, and appeared to be the result of magic, rather than of skill acquired by practice. I had several times great curiosity to approach them, to ascertain by what means their bodies could be suspended in this manner, where nothing could be seen but the heel hanging over the horse's back. In these endeavours I was continually frustrated, until one day I coaxed a young fellow up within a little distance of me, by offering him a few plugs of tobacco, and he in a moment solved the difficulty, so far as to render it apparently more feasible than before; yet leaving it one of the most extraordinary results of practice and persevering endeavours. I found, on examination, that a short hair halter was passed around under the neck of the horse, and both ends tightly braided into the mane, on the withers, leaving a loop to hang under the neck, and against the breast, which, being caught up in the hand, makes a sling into which the elbow falls, taking the weight of the body on the middle of the upper arm. Into this loop the rider drops suddenly and fearlessly, leaving his heel to hang over the back of the horse, to steady him, and also to enable him when he wishes to regain his upright position on the horse's back.

Besides this wonderful art, these people have several other feats of horsemanship, which they are continually showing off; which are pleasing and extraordinary, and of which they seem very proud. A people who spend so very great a part of their lives actually on their horses' backs, must needs become exceedingly expert in every thing that pertains to riding—to war or to the chase; and I am ready, without hesitation, to pronounce the Camanchees the most extraordinary horsemen that I have seen yet in all my travels, and I doubt very much whether any people in the world can surpass them."

The Indians, again, who live farther north from Mexico, and who are compelled to live as their fathers did, far excel the Camanchees in all ball-plays, games, and sports performed on foot, and these form much of the business of Indian life. To entertain our readers, we quote one scene which Mr Catlin saw at a great Indian dance at St Anthony on the Upper Mississippi. "During this scene, a little trick was played off in the following manner, which produced much amusement and laughter:—A woman of goodly size, and in woman's attire, danced into the ring (which seemed to excite some surprise, as women are never allowed to join in the dance), and commenced sawing the air, and boasting of the astonishing feats of bravery she had performed—of the incredible number of horses she had stolen—of the scalps she had taken, &c. &c.; until her feats surpassed all that had ever been heard of—sufficient to put all the warriors who had boasted to the blush. They all gave assent, however, to what she had said, and apparently credence, too; and to reward such extraordinary feats of female prowess, they presented to her a kettle, a cradle, beads, ribbons, &c. After getting her presents, and placing them safely in the hands of another matron for safe keeping, she commenced disrobing herself; and, almost instantly divesting herself of a loose dress, in the presence of the whole company, came out in a soldier's coat and pantaloons, and laughed at them excessively for their mistake. She then commenced dancing and making her boasts of her exploits, assuring them that she was a man, and a great brave. They all gave unqualified assent to this, acknowledged their error, and made her other presents of a gun, a horse, of tobacco, and a war-club. After her boasts were done, and the presents secured as before, she deliberately threw off the pantaloons and coat, and presented herself at once, and to their great astonishment and confusion, in a beautiful woman's dress. The tact with which she performed these parts, so uniformly pleased, that it drew forth thundering applause from the Indians, as well as from the spectators; and the chief stepped up and crowned her head with a beautiful plume of the eagle's quill, rising from a crest of the swan's down."

At another opportunity, we shall present a further notice of these highly interesting volumes.

LETTERS FROM A LADY IN LONDON TO HER NIECE IN THE COUNTRY.

STAFFORD HOUSE.

My dear Jane,—As my last letter appears to have afforded you some degree of gratification, I am again tempted to address you, in the hope that this epistle may prove equally amusing to you. Since I last wrote, I have been making the best use of my time, to dispose of which judiciously in London requires no small degree of management. Some days ago, I was fortunate enough to procure a note of admission to Stafford House, the town residence of the Duke of Sutherland. This is not one of the common sights of London, no one being admitted without an order from the Duke or Duchess of Sutherland. Along with two friends, I availed myself of the privilege which had been obtained, on Friday last, and what I saw on that occasion will be the subject of my present communication.

Stafford House is next to St James's Palace, the back looking towards St James's Park, and the front entrance looking in the same direction as the front of the palace; the side windows command a view of the door of St James's, which is not in the front of the building—at which door, I believe, the Queen always enters. The drive or carriage-road leading to the park, divides Stafford House from the Palace of St James's. The house is a large, handsomely built, square edifice, possessed originally by the Duke of York, after whose death it became the residence of Mrs Coutts, afterwards Duchess of St Albans. It was ultimately bought by the late Duke of Sutherland; but the furnishing and arrangements internally were not completed until after it came into the possession of the present noble proprietor, who has spared nothing that could add to the effect of the internal decorations.

The main entrance to Stafford House is surmounted by a stone pediment supported on pillars. On entering the lobby, which is laid with black and white floor-cloth, you find yourself reflected in the opposite doors, which are entirely composed of mirror glass. There is a small apartment on the right and another on the left side of the door, for the accommodation of the porter, I suppose. You ascend one or two steps, and by a side door are admitted into a long corridor, lighted by a window looking to the front. This gallery is hung with pictures, and along each side there are close cabinets, painted cream colour, containing books. The tops of these cabinets, which were about four feet high, are of white marble, surmounted with busts, vases, and various kinds of ornaments. There are, besides a fine portrait of the present duke by Sir Thomas Lawrence, marble busts of the duke and duchess, beautifully executed, the one on the right and the other on the left hand in walking along. At the extremity of this corridor, we were admitted to a moderately sized apartment, in which there were some of the finest landscape paintings I ever saw—what made them so singularly pleasing was their appearing *perfectly natural*. We were led from this into an apartment on the right, where there is a bronze statue of the present Marquis of Stafford, the eldest son of the duke, in a Highland dress. The walls of this room are of green satin damask. We passed again through the first room to another, the walls of which are graced by some of Wilkie's paintings. On one side is a fine portrait of Lady Grosvenor, which had had the effect of at one time inspiring a groom of the chambers with a passion for painting, which he indulged by making a very tolerable copy. The Countess-Duchess of Sutherland took the picture, and rewarded the aspiring groom handsomely. This house appears to be favourable to the development of genius, for we were told of another person, a boy, who acted as a kind of supernumerary in the butler's pantry, and who tried to copy a portrait of the duke. He was also taken notice of and encouraged. Next to this is the drawing-room, a fine large room, with two handsome fire-places, the mantel-pieces being of white marble, beautifully carved. The walls are hung with yellow satin damask; the sofas, chairs, &c., of yellow and blue satin damask. In the middle of the room there is a raised pillar, of some kind of white composition, with a thick wreath of gilding twining round it. This pillar supports a globe or ball of bronze, encircled by a belt of gilt, with numerical figures round it. Under the ball there are little bronze figures, holding up a serpent, and the head of the serpent acts as a hand of a clock, the machinery being within the ball, which revolves, the figures indicating the time: round the base of the pillar is a circular sofa. In the next room, over the mantel-piece, is a splendid full-length portrait of the Duchess of Sutherland, with a beautiful child seated on her knee. Opposite to this is a picture by Martin—the Assuaging of the Waters of the Deluge. This is the last of the suite of rooms on the ground-floor to the back, all of which look into St James's Park. You issue from this into another long corridor, corresponding exactly with the one on the other side by which we entered, also filled in the same tasteful manner with some very fine paintings, vases, &c. There were two pictures, so beautiful that we could have lingered before them for hours. These represented the children of the Duke of Sutherland—lovely little creatures, elegant in form and feature, and gracefully grouped together.

I find myself obliged to allude so frequently to members of the family, that it seems necessary I should acquaint you with a few particulars respecting it. You are aware of an immense county in the north of Scotland, called Sutherland, which is composed entirely of mountains, valleys, and lakes. This wholly belonged, from the latter part of the twelfth century, to a family supposed to be of Flemish origin, who took their name from it, and became its earls, as a title inferring the possession of and dominion over the land. The Earls of Sutherland continued to exist in an unbroken line of succession for many ages, taking part in most of the great transactions of their time. I may mention, for instance, that the Earl of Sutherland was the first person who signed the National Covenant, on its being brought before the people in the Old Greyfriars' Church in Edinburgh, in the year 1638, the object of the document being to unite the Scottish people in resistance to Charles I. A numerous clan and following recognised the Earl as their chief, calling him, in their own language, *Morar Chat*, or the great man of the Clan Chattan. At length, after an unbroken line of seventeen earls, the late countess succeeded, when an infant of fifteen months old, notwithstanding a powerful legal opposition from two male relatives. She was called by the Highlanders the *Banie Morar Chat*, or Woman Morar Chat. She was one of the cleverest peeresses of her day, being in particular a remarkably good draughtswoman. It was her fortune to marry an English nobleman of ancient lineage, and property immense as her own, though perhaps not covering so large a piece of the globe's surface—George Earl Gower, afterwards Marquis of Stafford. In the latter part of their lives, this couple, by the favour of William IV., became Duke and Duchess of Sutherland, a title which has now descended to their eldest son. It used to be said of the Duke of Sutherland, that his income was equal to a thousand pounds a-day. Some years before you knew the world, he executed upon the Countess's Highland estates a change of a most remarkable nature, converting what had formerly been an enormous cluster of small farms, where the people in general lived very miserably, into a series of large sheep-farms, where the people are few but comparatively affluent and comfortable, the superfluous people being mostly removed to villages on the coast, where they practise fishing and other industrious arts. The change was productive of great discontent, and not in every case effected without somewhat strong measures; but it is every where acknowledged that the views of the marquis (for such was then his title) were good, and that he himself meant that no one should suffer in any respect; and, while Sutherlandshire now sustains as large a population as ever, it cannot well be doubted that the individuals composing it are much better off, in all essential points, than they ever were before. You may believe, as I was walking amidst the splendours of Stafford House, I was constantly thinking of the connexion of the family with various scenes in my native country of a very different kind—from ancient Dunrobin on the Sutherlandshire coast, where they once lived in a single lofty tower, to Leven House in the suburbs of Edinburgh, where the late Duchess-Countess was born in 1765—a mansion then considered a neat villa for a nobleman's residence,

but now fallen into a very poor condition, and generally occupied by a very humble class of people.

In the corridor last mentioned, we found a bronze cast taken from the face of Napoleon after death. The features are sharp and angular, although the outline of the face is that with which every one almost is familiar. From one side of this gallery we were led into the grand hall and magnificent staircase, which exceeds any thing I have ever seen or imagined. There is a similar entrance from the opposite gallery, so that you can approach from either side. This hall is 73 feet high, and in space 79 feet by 50. The proportions are on a noble scale, and every thing is in keeping with the grand plan. The floor is black and white, and the walls are of variously coloured scagliola, inlaid with a transparent kind of spar, and highly polished, so that one might mistake it for some precious kind of stone. To relieve the great expanse of the walls, which would otherwise meet the eye with a tame effect, parts are raised in such a manner as to appear panelled. A spacious gallery runs round three sides of this hall, supported by bronze figures; and on one side, in the lower hall, stands a superb table of porphyry. The ceiling is white, richly gilt; and under the dome is a row of windows, each divided from the other by a figure (of which there are twelve), the upper half being of bronze, and the lower part terminating in a gilt scroll. The figures appear to support the dome on their heads. The effect of this at night, when brilliantly illuminated, must be very grand: we were told that there are a hundred lights in the hall and staircase, besides a row of jets *outside* the windows in the roof, which pour in a flood of softened light—like brilliant stars, I should suppose.

We were now taken up the grand staircase, which branches off on each side; that on the right leading to the private apartments of the duchess, and the left taking us to the public rooms. The gallery is very spacious, with a massive balustrade running round, the effect heightened by beautiful pillars of grey marble, of immense height. The doors opening out on the gallery are all panelled with mirror-glass; and by one of these, on the right hand, we were conducted through a small room purposely fitted up as a stove-room, for heating plates, &c., adjoining the grand dining-room. The latter is a beautiful apartment indeed, and evinces more than any thing the exquisite taste of the proprietor of this princely mansion. I think the length was 80 feet by 50; but I may mistake in this. The floor is of inlaid oak, highly polished; the walls are white, with an elegant gilt scroll. At each end, the room is contracted, forming a recess, supported with massive pillars of white, fluted with gold; at the upper end is the sideboard for the display of plate—all above and behind it being of mirror-glass, which will reflect not only the plate but the company. The ceiling is superbly decorated, being divided into compartments of white, and richly ornamented with gold; from the centre depends one large chandelier, lacquered with gold. There are two fireplaces, of richly carved white marble, and opposite to them a window, the only one in the room, looking to the front of the house. The dining-room was used, for the first time, last year, on the occasion of the Queen and Prince Albert visiting the Duke and Duchess of Sutherland. The entertainment was laid here, and a splendid one it would be, I have no doubt. Unknown to her Majesty, the band of the Guards was concealed somewhere about the gallery, and when she had entered, struck up the national anthem; this appeared to gratify the royal visiters not a little. A small, curiously-formed chamber or ante-room, leads from the dining-room to the grand saloon, the largest apartment in the house, being 124 feet long, by 33 feet in the centre, where it widens, contracting to 24 feet at each end. The floor is polished oak, the walls a sort of cream colour, and the furniture crimson velvet and gold. In the centre stands a semicircular sofa, at least 20 feet long, covered with crimson velvet, the back high, and covered with the same rich material; a sort of broad ledge or finish, of white marble, runs all the way along the top, and terminates in an elegant scroll and figure at each end. The ceiling is lofty, and is in the same style as that of the staircase; windows of ground glass, surmounted by a sort of oblong pediment supported by fanciful pillars of gilt. On each side of the fire-place there is a splendid painting by Murillo—one representing the Prodigal Son, and the other the Angels appearing to Abraham.

There are various portraits in the room, all more or less interesting, most of them by the old masters. The windows in the side of this room look towards St James's, and that at the end looks into the Park, and commands a view of Westminster Abbey. The use of this beautiful room was kindly given by the Duchess of Sutherland, a year or two ago, to some of the most distinguished musical performers in London, who combined their respective talents in aid of the Polish refugees. The saloon was fitted up as a concert-room, and had the effect of drawing a crowded audience, for the opportunity of seeing the interior of Stafford House was itself a powerful attraction. The state drawing-rooms lead off from the saloon; but neither these nor the private apartments were shown. We had no reason to complain, however; we had seen enough to impress us with gratified wonder at the exquisite taste and refined ingenuity which have been displayed by the duke in the fitting up of this splendid mansion. In descending the stairs, we found on the wall opposite a series of mirrors: this, we were told, is the grand door of entrance leading from the outer lobby; so that, when this splendid door is thrown open, the staircase is seen from the lobby. These glass panels, we were told, were fitted up at the cost of L.700. So much, dear Jane, for the "sight" of Stafford House, than which I could scarcely wish you a greater treat; but, until such time as you can accomplish this, I hope you will rest contented with this gossiping description from your affectionate aunt.

PROVISION AGAINST THE EVIL DAY.

One remarkable feature of the social condition of this country, is that, while the upper classes have real and well-secured funds to depend upon in all contingencies, and while the middle classes have generally business funds not to be exhausted in a short time, and by life-assurance can and to a great extent do secure their widows and orphans against want, the working-classes in general live from hand to mouth, not only making no provision for those they may leave behind them, but scarcely assured of having the means of putting over a week's sickness, without being obliged to have recourse to some humiliating expedient. This is a deplorable state of things; for, while the competitive system lasts, he who is always on the verge of dependence is necessarily the slave of those to whom he looks for succour. A right condition of the working-classes would, we apprehend, include the idea of their being perfectly self-dependent.

To this end it seems absolutely necessary that they should husband their gains in such a manner as to enable them to provide against the usual evils of life. Their gains are either sufficient for this purpose, or they are not: if they are, it is an obvious duty that they should be used for that amongst other purposes; if not, then the predicament of the working-classes is in some way wrong, and should be amended. Assuredly, while this large portion of the community has to look to the middle and upper classes for succour in every kind of distress, to however small an extent that succour may be required, in so far do they forfeit their independence and suffer a moral deterioration. They ought to be enabled, by the correctness of their views on these points, and by the amount of their gains, to ensure themselves against every casualty, even the temporary failure of employment. All who are acquainted with the doctrine of probabilities, know that to ensure against even that last peculiar casualty would be merely a matter of calculation, and easily practicable if a sufficiently large number were to unite.

Passing in the mean time from the general question, let us consider the means which at present exist to enable working-men to provide against the evils of their lot. We once showed (No. 357) by what simple means a union of working-men could provide themselves and their families with medicines and medical attendance, thereby rendering themselves quite independent of infirmaries and dispensaries—institutions which, though necessary in the present state of society, and creditable to the good feelings of the wealthier classes, are in reality a degradation to the classes benefited by them. Let us now see by what means an association of working-men could provide that each, during sickness, should have an independent means of support, and also enjoy an income when the days for toil are past.

It is well known that institutions for these objects have long existed under the name of *Friendly* or *Benefit Societies*. A disposition to enter into and support such societies may be said to be general amongst the labouring portion of the community; yet not by any means so general as could be wished, while it is equally to be lamented that many of the societies which do exist, are founded upon no certain calculations, so that their permanence cannot be depended on, and many of their members must be disappointed of the object they have in view.

We cannot sufficiently impress upon all who have to do with friendly societies, that, if these have not been founded on calculations, and calculations of a proper kind, no good is to be expected of them. Supposing a friendly society to contemplate a weekly aliment in sickness and an annuity in old age, the points to be ascertained for its right foundation, are—first, what is the amount of time per annum in the ensuing life of each member, which may be expected, from the average of a vast number of like cases, to be spent by him in sickness?—and, second, how many out of each set at a certain age, may be expected to survive sixty, and for how long? A wide range of experience makes it possible to calculate these things with some degree of precision. That patriotic body, the Highland Society of Scotland, obtained returns from a great number of friendly societies, from which tables were compiled for the purpose of showing the true probability of sickness and mortality amongst the working-classes. It is now acknowledged that, from the imperfection of the returns, these tables give too favourable a view of the case, and would be an unsafe basis to ground upon in practice. Yet we may enter a little into them for the sake of illustration. It appeared that, between twenty and thirty years of age, a man has the chance of being a little more than half a week per annum indisposed. For each year there is an exact amount—as, for instance, at the age of twenty-eight, he has the chance of being just about six-tenths (0·603) of a week sick; but we need not here specify so closely. Between thirty and forty, the probable annual duration of sickness is a little higher, or about two-thirds of a week overhead (strictly from 0·621 to 0·758 parts of a week). At forty-six, his chance is a-week per annum. At fifty-seven, it rises to two weeks. A man's whole chance of sickness, from his twenty-first to his sixtieth year, inclusive, is nearly forty-two weeks. Above that period of life, the days of disability multiply fast. At seventy, he is nearly eleven weeks out of the fifty-two seriously unwell.

Since the Highland Society made these observations, the Society for the Diffusion of Useful Knowledge has exerted itself in a similar way, and a theoretical table has been compiled by Mr Edmonds. We shall present the results of all the three investigations in a tabular form, showing the proportion of sick out of 100 persons living at certain intervals of age:—

Ages.	Scotch Benefit Societies.	English Benefit Societies.	Mr Edmond's Theoretical Table.
20 to 30	1·14	1·54	1·72
30 to 40	1·32	1·83	2·30
40 to 50	1·97	2·56	3·10
50 to 60	3·60	4·32	4·51

In these three tables there is, it will be observed, a considerable difference. We may mention, that some societies in Edinburgh have found their experience of sickness exceed the Highland Society rate by, at an average, 87 per cent.; a result which we find accounted for in a very intelligible way by a report of the Edinburgh Compositors' Society. In the societies from which the Highland Society obtained returns, the extension of relief was considered as a kind of charity, and applications were therefore only made in extreme cases. But in the societies in question, the pension during sickness is regarded as a right, and therefore freely taken.

A few years ago, some interesting observations were made with respect to the large body of men employed as artisans and labourers in the dockyards at Woolwich, Chatham, Portsmouth, &c. In the three years included in the observations, 1831, 2, and 3, there was that general uniformity of result which tends to give confidence in the arrangements made in consequence of such inquiries. We shall give the results for 1831 and 2, as the number of men was nearly the same in those years, namely, 2079 and 2002. The cases of diseases in the two years were, respectively, 697 and 888; of hurts, 357 and 325; the total days of sickness, respectively, 15,072 and 14,225. If we might be justified in taking this body of working-men as a criterion, it would appear that, in the year, every 1 man in 6 of this class is seriously hurt, and that 2 in 5 fall ill. Each man is liable to have an attack of illness, either spontaneous or caused by external injury, every two years; and at an average each disease lasts 14 days. *When we see these painful contingencies presented in so distinct and certain a form, the necessity of providing against them becomes strikingly apparent.*

Amongst the East India Company's labourers in London—men selected at first as sound and strong, but working and also dwelling in somewhat unfavourable circumstances, in the centre of a crowded city—it was found, by a calculation made a few years ago, that, between the ages of 20 and 30, there were sick 1·36 per cent.; between 30 and 40, 1·38; between 40 and 50, 1·46; between 50 and 60, 1·91; being a less rapid advance of sickness with advancing age than has been observed in other cases.

From the difference observed in these and other cases, it would appear necessary, in forming a friendly or benefit society, to look to data adapted to the special class who are to form it.

What, in a general view, are the proper principles for forming a benefit or friendly society, which shall include a provision for both sickness and old age? It is clear, in the first place, from what we have seen, that the contributions of the various members should have a respect to their different ages. We may have an idea of a benefit society in its simplest form, if we suppose a hundred men, of exactly 33 years of age, to associate, and make such a payment at first as may be sure to afford each man that shall fall sick during the ensuing year one shilling a-day during the term of his sickness. Taking (for the sake of illustration) the Scottish tables, we find that, amongst such a body of men, there will be about 66 weeks of illness in the course of the year. This, multiplied by 7, gives the whole sum required, L.23, 2s., or a little more than 4s. 6d. each, which, less by a small sum for interest, will accordingly be the entry-money of each man. A society of individuals of different ages, each paying the sum which would in like manner be found proper to his age, would be quite as sound in principle as one on the above simple scheme. It is only a step further to equalise each man's annual payments over the whole period during which he undertakes to be a paying member.

We shall suppose that the superannuation allowance or pension is contemplated as commencing at 60 years of age. It is necessary to consult tables of mortality, in order to ascertain how many may be expected to reach that age, and how long each of these has a chance of surviving it. We have so recently treated of tables of mortality (under the article Rates for

Life Assurance, in No. 505), that we shall not say much on this subject. The table presented by the Highland Society, as proper for friendly societies, is a mean of the Northampton, Carlisle, and Swedish tables, and may be regarded as tolerably safe for both life-assurance and annuity schemes. It shows, that of 1005 persons of 21 years of age, no fewer than 528 reach the age of 60, 336 that of 70, and 127 that of 80; thus making it evident *how absurd it is for a working man to think that he has an extremely small chance of growing old, so as to need a provision.*

Another point for consideration is the rate at which the funds of the society may be improved. In most cases, we believe, it is best for such societies to rest content with taking advantage of the privilege which they enjoy by act of parliament, to deposit their money in the savings' banks, in which case they obtain for it (considering the half-yearly payment of interest) about L.3, 17s. 6d. yearly.

The scheme of a right benefit society may be further illustrated by the actual arrangements of one of approved character, which happens to be well known to us. We allude to the Edinburgh School of Arts' Friendly Society, established about thirteen years ago. This society, although originating with certain of the members of and friends to the School of Arts (a species of mechanics' institution, and taking its name), is not otherwise connected with that institution, but is open to all persons, male and female, residing in Edinburgh. It has three separate funds or schemes—namely, a *Sickness Fund*, *Deferred Annuity Fund*, and a *Life Assurance Fund*. *One share* of the sickness fund entitles the member during sickness to 10s. a-week for 52 weeks, 7s. 6d. a-week for other 52 weeks, and 5s. a-week for all future period of sickness until the age of 60 or 65, according to the age of superannuation fixed at entry; and thereafter his contributions cease, and he enters to the enjoyment of the *Deferred Annuity Fund*, one share of which entitles the member to an annuity of L.8 a-year, commencing at the age of 60 or 65, as fixed at his entry. One share of the Life Assurance Fund is a sum of L.10 payable at the member's death. In this case, as in the others, the contributions cease at the age of 60 or 65.

The rates are calculated from the Highland Society's sickness table, increased by 50 per cent., which in this case may be considered as sufficient (seeing that only sound healthy men are admitted), and a mortality table compounded of the Northampton, Carlisle, and Swedish, assuming the rate of interest at 4 per cent. accumulated yearly; and the only charges for management are 2s. 6d. entry-money to each fund, and 1s. a-year payable by each member of each fund.

The following is an example of the payments required for *one share* in all the three funds; namely—

Payments to Cease at the age of Sixty.

Age.	Annual Payment.	Monthly Payment.
25	£1 10 5	£0 2 6½
30	1 17 3	0 3 1½
35	2 6 3	0 3 11½

Payments to Cease at Sixty-five.

Age.	Annual Payment.	Monthly Payment.
25	£1 5 9	£0 2 2
30	1 10 7½	0 2 6½
35	1 17 5	0 3 1½

So that a person of the age of 25, for an entry-money of 7s. 6d., and a payment of 2s. 2d. a-month until the age of 65—or L.1, 5s. 9d. a-year—may secure an allowance of 10s. a-week during sickness for 52 weeks—7s. 6d. a-week for other 52 weeks—and 5s. a-week during the whole remaining period of sickness, until the age of 65, an annuity of L.8 a-year during life after 65, and a sum of L.10 at death.

Or, for 4s. 4d. a-month, or L.2, 11s. 6d. a-year, double of these allowances.

At an examination of the society's transactions and funds in December 1840, it was found that, after twelve years of business, when the deaths of unfree members, or persons who died in the first year of membership, were deducted, the mortality was within that allowed for by the tables, and that all the three funds were in a good condition, each showing a surplus over what was necessary to make good the claims to which it was liable, when the value of the future contributions was taken into account against the value of the promised benefits.

This society numbers 250 members, which is far below what might be expected in so large a city, even making every allowance for other existing means of provision.

We would hope that the present paper will be of some little service in calling the attention of the working-classes to the benefits which they have it in their power to confer upon themselves by means of rightly constituted benefit societies. To make themselves independent during sickness and old age, and to ensure that their wives and children shall have something to look to in the event of their decease—what objects of a merely this-world kind can be nobler! It costs money and a little restraint on immediate desires to accomplish these ends, but it does not cost, upon a right system, nearly so much as might be supposed; and though it were to cost more, would it not be worth while? We verily believe that the working-classes are not generally informed as to the principles of benefit societies, or they would take much more extensive advantage of them than they do. Every one who resorts to such a society makes an advance in a true moral condition, and gives incalculable strength to his position in life, and the peace of his own mind.

POPULAR ENGLISH FESTIVALS.

SHROVE-TUESDAY.

Shrove-Tuesday may occur on any day between the 2d of February and the 8th of March, being the day antecedent to that commencing Lent. [In the present year it falls on the 8th of February.] Throughout Christian Europe, it has been customary, from early times, to preface the solemnity and sober living of the forty days of Lent with one, two, or more days of unlimited merriment, sport, feasting, and playing of practical jokes, as if men were anxious to season themselves for what they felt to be a period of dullness, by giving themselves the disgust of satiety with every thing cheerful. In Rome, as is well known, this merry prologue to Lent is called the Carnival, meaning the farewell to flesh—no such food being used during the ensuing forty days. In England, the same period is styled Shrove-tide, from its being customary, in an early age, for the people to confess their sins, and be *shrived*, or *shrove*, at that time. They also had the name of Collop-Monday for the day before Shrove-Tuesday, while Ash-Wednesday was the title of the first day of Lent. In Scotland, where no religious observance of this season has been in use for centuries, Shrove-Tuesday is slightly known as St Fasten's Eve or Fastren's E'en.

Collop-Monday, it may be remarked, got its name from a custom all over England of dining on collops (steaks of salted meat) and eggs on that day. The boys on that day went about in bands, singing,

> "Shrove-tide is nigh at hand,
> And I am come a-shroving;
> Pray, dame, something,
> An apple or a dumpling,
> Or a piece of truckle cheese
> Of your own making,
> Or a piece of pancake."

On this day it is a regular practice of the boys at Eton to write Latin verses, in all kinds of metres, in praise of Bacchus, and fix them to the college doors. Perhaps this is a vestige of a supposed connexion between the Christian festivals of this season with the Gentile rejoicings and festivities of the same period of the year in honour of the god of wine.

Shrove-Tuesday has been from time immemorial in England a day of unusual merriment, feasting, and sport. "Welcome, merry Shrove-tide!" sings gentle Master Silence. At an early period of the day, the bells were set a-ringing, generally by the people themselves, and it was from that time till a late hour in the evening held allowable to indulge in an unlimited preparing and devouring of pancakes. So conspicuous was this fare on the occasion, that the day was sometimes called Pancake Day. Shakspeare makes his clown in "All's Well that Ends Well" speak of something being "as fit as a pancake for Shrove-Tuesday." It will be recollected that the parishioners of the Vicar of Wakefield "religiously ate pancakes at Shrove-tide." Hear also our quaint old friend, the Water Poet—"Shrove-Tuesday, at whose entrance in the morning all the whole kingdom is inquiet, but by that time the clock strikes eleven, which (by the help of a knavish sexton) is commonly before nine, there is a bell rung called Pancake Bell, the sound whereof makes thousands of people distracted, and forgetful either of manners or humanity. Then there is a thing called wheaten flour, which the cooks do mingle with water, eggs, spice, and other tragical, magical enchantments, and then they put it by little and little into a frying-pan of boiling suet, where it makes a confused dismal hissing (like the Lernian snakes in the reeds of Acheron), until at last, by the skill of the cook, it is transformed into the form of a flip-jack, called a pancake, *which ominous incantation the ignorant people do devour very greedily.*" It is curious to learn from old Hakluyt, that pancakes were also eaten in Russia at this time. A poem published in 1634,* thus speaks of the custom in England:—

> "It was the day whereon the rich and poor
> Are chiefly feasted with the self-same dish;
> When every paunch, till it can hold no more,
> Is fritter-filled as well as heart can wish;
> And every man and maid do take their turn,
> And toss their pancakes up for fear they burn;
> And all the kitchen doth with laughter sound,
> To see the pancakes fall upon the ground."

It was customary to present the first pancake to the greatest slut or lie-a-bed of the party, "which commonly falls to the dog's share at last, for no one will own it their due."† Some allusion is probably made to the latter custom in a couplet placed opposite Shrove-Tuesday in Poor Robin's Almanac for 1677:

> "Pancakes are eat by greedy gut,
> And Hob and Madge *run for the slut.*"

In the time of Elizabeth, it was a practice at Eton for the cook to fasten a pancake to a crow upon the school door; and, till a recent period, the under-clerk at Westminster School was accustomed on this morning to enter in solemn wise, preceded by the beadle and other officers, and throw a pancake over the screen which divides the forms of the upper from those of the under scholars.

The revels of Shrovetide were of a very miscellaneous order—some being innocent, and others, we grieve to say, much the reverse. We shall first advert to those of an innocent character. The chief of these seems to have been foot-ball, which was conducted with great spirit, the old looking delightedly at the feats of the young. At Alnwick, the ball is thrown to the populace from the walls of the castle. The apprentices of London, all of whom were let loose from serious occupation on this day, enjoyed the sport in Finsbury Fields. The sport continues to be practised with great vigour at the villages of Kingston and Teddington, in the vicinity of London, where the people have to put hurdles and bushes over their windows to protect them from the balls. But we are not aware of any part of the kingdom where this Shrovetide sport is kept up with so much energy as at the village of Scone, near Perth, in Scotland. The men of the parish assemble at the cross, the married on one side and the bachelors on the other; a ball is thrown up, and they play from two o'clock till sunset. A person who witnessed the sport in the latter part of the last century, thus describes it:—"The game was this: he who at any time got the ball into his hands, ran with it till overtaken by one of the opposite party; and then, if he could shake himself loose from those on the opposite side who seized him, he ran on; if not, he threw the ball from him, unless it was wrested from him by the other party, but no party was allowed to kick it. The object of the married men was to *hang* it, that is, to put it three times into a small hole on the moor, which was the *dool*, or limit, on the one hand: that of the bachelors was to *drown* it, or dip it three times in a deep place in the river, the limit on the other: the party who could effect either of these objects won the game; if neither won, the ball was cut into equal parts at sunset. In the course of the play, there was usually some violence between the parties; but it is a proverb in this part of the country, that 'A' is fair at the ba' o' Scone.'" A similar foot-ball play took place at Inveresk in the county of Edinburgh.

Taylor, the Water Poet, alludes to the custom of a fellow carrying about "an ensign made of a piece of a baker's mawkin fixed upon a broom-staff," and making orations of nonsense to the people. Perhaps this custom may have been of a similar nature and design to one practised in France on Ash-Wednesday. The people there "carry an effigy, similar to our Guy Faukes, round the adjacent villages, and collect money for his funeral, as this day, according to their creed, is the burial of good living. After sundry absurd mummeries, the corpse is deposited in the earth."‡ In the latter part of the last century, a curious custom of a similar nature still survived in Kent. A group of girls engaged themselves at one part of a village in burning an uncouth image, which they called a *holly boy*, and which they had stolen from the boys; while the boys were to be found in another part of the village burning a like effigy, which they called the *ivy girl*, and which they had stolen from the girls; the ceremony being in both cases accompanied by loud huzzas.† These are fashions, we humbly opine, smacking of a very early and probably pagan origin. At Bromfield, in Cumberland, there used to be a still more remarkable custom. The scholars of the free school of that parish assumed a right, from old use and wont, *to bar out the master*, and keep him out for three days. During the period of this expulsion, the doors were strongly barricaded within; and the boys, who defended it like a besieged city, were armed in general with guns made of the hollow twigs of the elder, or bore-tree. The master, meanwhile, made various efforts, by force and stratagem, to regain his lost authority. If he succeeded, heavy tasks were imposed, and the business of the school was resumed and submitted to; but it more commonly happened that all his efforts were unavailing. In this case, after three days' siege, terms of capitulation were proposed by the master and accepted by the boys. The terms always included permission to enjoy a full allowance of Shrovetide sports.‡

Of a similar jocular character is a custom kept up at Leicester. There is in this ancient town an open space called the Newarks, of a cross form, accessible by three gates, and surrounded by tall buildings. In the afternoon of Shrove-Tuesday, three men take possession of this place, armed with waggon whips, and each attended by another man carrying a bell. These fellows, who are called Whipping Toms, claim a right to flog every body entering or passing through the Newarks whom they can catch, and this as long as the attendant bellman can keep ringing his bell. The amusement consists in surrounding the bellman and silencing his bell, for during the cessation of ringing the whipper is powerless: this, however, is a service of some hazard, and requires the combined address and activity of the young men who take part in the frolic. As soon, however, as a Whipping Tom finds his companion silenced, and subject to the laugh of the spectators, he hurries with his attendant bell to the rescue, and the scene becomes one of considerable mirth and animation, and many daring attempts are made to capture the succouring bell and increase their amusement on the one hand, and to liberate the captured bell and get both whips into action on the

other. By the three outlets from the place escape is easy; in a nook called Little London, if you can attain it, you are entitled to sanctuary. The bustle, activity, and address, elicited by the whole affair, and the merriment of the spectators as bells are captured or luckless wights subjected to whipping, render it an afternoon of great excitement, which the young especially talk of for months before and after.*

We have now to advert to some of the sports of this day, which cannot be considered as of an innocent character. The chief and most conspicuous of these was the practice of *throwing at cocks*. It seems to have been universal in England a century ago, and perhaps still lingers in some of those places which William Howitt calls nooks of the country, where modern refinements have not yet penetrated in great strength. It will be recollected that Hogarth makes this sport the first subject in his series of pictures entitled the *Four Stages of Cruelty*. The poor animal was tied to a stake by a short cord, and the unthinking men and boys, who were to throw at it, took their station at the distance of about twenty yards. Where the cock belonged to some one disposed to make it a matter of business, twopence was paid for three *shies* at it, the missile used being a broomstick. The sport was continued till the poor creature was killed outright by the blows. Such tumult and outrage attended this inhuman sport a century ago, that, according to a writer in the Gentleman's Magazine, it was sometimes dangerous to be near the place where it was practised. Hens were also the subjects of popular amusement at this festival. It was customary in Cornwall to take any one which had not laid eggs before Shrove-Tuesday, and lay it on a barn-floor to be thrashed to death. A man hit at her with a flail; and if he succeeded in killing her therewith, he got her for his pains. It was customary for a fellow to get a hen tied to his back, with some horse-bells hung beside it. A number of other fellows, blindfolded, with boughs in their hand, followed him by the sound of the bells, endeavouring to get a stroke at the bird. This gave occasion to much merriment, for sometimes the man was hit instead of the hen, and sometimes the assailants hit each other instead of either. At the conclusion, the hen was boiled with bacon, and added to the usual pancake feast. Cock-fights were also common on this day. Strange to say, they were in many instances the sanctioned sport of public schools, the master receiving on the occasion a small tax from the boys under the name of a *cock-penny*. Perhaps this last practice took its rise in the circumstance of the master supplying the cocks, which seems to have been the custom in some places in a remote age. Such cock-fights regularly took place on Fasten's E'en in many parts of Scotland till the middle of the eighteenth century, the master presiding at the battle, and enjoying the perquisite of all the runaway cocks, which were technically called *fugies*. The greatest of our alarmists must surely allow that in some small particulars we have improved upon the customs of our forefathers.

Latterly, an idea seems to have prevailed that the cocks martyred upon Shrove-Tuesday were typical, from the identity of their name in Latin (*Galli*), of our great national enemies the French. And we can easily imagine some country justices being led by this notion to encourage the sport, thinking that every *shy* taken at the unfortunate cock was fostering a salutary hatred of the French in the breasts of those who were yet perhaps to fight their country's battles. There was even a supposition, to which Hearne the antiquary gave some countenance, that the practice took its rise at the time when Henry V. was pursuing his wars in France, being designed to show that the English could as easily overthrow the Galli of their own species as the Galli of the farm-yard. A writer in the Gentleman's Magazine of 1737, suggests that perhaps we find a trace of this notion in the architectural conceit placed over the portal of Blenheim House, where a monstrous lion is seen tearing to pieces a harmless cock. And he adds a just sentiment with regard to the Shrovetide cock-throwings, supposing them to have the above object in view—"'Tis a low mean expression of our rage, even in time of war." But the idea of a reference to the French is totally inadmissible, when we find that the custom existed long before the commencement of our wars with France. Another popular notion is, that it took its rise in consequence of a very early incident in our history. "When the Danes were masters of England, and lorded it over the nations of the island, the inhabitants of a certain great city, grown weary of their slavery, had formed a secret conspiracy to murder their masters in one bloody night, and twelve men had undertaken to enter the house by stratagem, and, seizing the arms, surprise the guard which kept it; and at which time, their fellows, upon a signal given, were to come out of their houses and murder all opposers: but when they were putting it in execution, the unusual crowing and fluttering of the cocks about the place they attempted to enter at, discovered their design; upon which the Danes became so enraged, that they doubled their cruelty, and used them with more severity than ever. Soon after they were forced from the Danish yoke, and to revenge themselves upon the cocks, for the misfortune they involved them in, instituted this custom of knocking them on the head on Shrove-Tuesday, the day on which it happened. This sport, though at first only practised in one city, in process of time became a national divertisement, and has continued ever since the Danes first lost the island." Such is the story told, it seems, by an old German author named Cranenstein, who writes of the customs observed by Christian nations.* We need scarcely remark that it seems insufficient to account for a sport of so peculiar a nature and so universal.

The other Shrovetide observances were chiefly of a local nature. The old plays make us aware of a license which the London prentices took on this occasion to assail houses of dubious repute, and cart the unfortunate inmates through the city. This seems to have been done partly under favour of a privilege which the common people assumed at this time of breaking down doors for sport, and of which we have perhaps some remains, in a practice which still exists in some remote districts, of throwing broken crockery and other rubbish at doors. In Dorsetshire and Wiltshire, if not in other counties, the latter practice is called *Lent Crocking*. The boys go round in small parties, headed by a leader, "who goes up and knocks at the door, leaving his followers behind him, armed with a good stock of potsherds—the collected relics of the washing-pans, jugs, dishes, and plates, that have become the victims of concussion in the hands of unlucky or careless housewives for the past year. When the door is opened, the hero, who is perhaps a farmer's boy, with a pair of black eyes sparkling under the tattered brim of his brown milking-hat, hangs down his head, and, with one corner of his mouth turned up into an irrepressible smile, pronounces the following lines:—

> 'I be come a-shrovin,
> Vor a little pankiak,
> A bit o' bread o' your biakin;
> Or a little truckle cheese o' your own miakin.
> If you'll gie me a little I'll ax no more,
> If you don't gie me nothin, I'll rottle your door.'

Sometimes he gets a bit of bread and cheese, and at some houses he is told to be gone; when he calls up his followers to send their missiles in a rattling broadside against the door."† It is rather remarkable that, in Prussia, and perhaps other parts of central Europe, the throwing of broken crockery at doors is a regular practice at marriages. Lord Malmesbury, who in 1791 married a princess of that country as proxy for the Duke of York, tells us, that the morning after the ceremonial, a great heap of such rubbish was found at her royal highness's door.

NOTICE TO AN HUMBLE CLASS OF EMIGRANTS.

A CORRESPONDENT who was desirous of receiving some distinct information on the subject of Canadian emigration, which unfortunately we had it not in our power to afford, lately made application to the Emigration Agent at Montreal, and has been favoured with a reply which he has placed in our hands to make public. The reply is written on the back of a printed document, which we present first. It is entitled—"Notice to persons desirous of settling at the Owen's Sound Settlement, situated in the upper part of the province of Canada," and is dated "Crown Lands' Office, 1st November 1840."

"Notice is hereby given, that a road through the crown land from the north-west angle of the township of *Garrafraxa to Owen's Sound, upon Lake Huron*, is opening at the expense of government. Lots of fifty acres of land each will be laid out on each side of the road.

Settlers who have never obtained a grant of land from government, may obtain a lot of fifty acres on the following conditions:—

1st, They are to make application to the commissioner of crown lands, or to the agent on the ground, whenever they shall be ready to become resident on the tract to be granted. 2d, Upon giving a satisfactory account of their means of providing for themselves, until a crop can be raised from the ground, they will receive a ticket from the commissioner at the Crown Lands' Office, entitling them to locate the land. 3dly, Upon application to the agent in the first place, he will forward a statement to the Crown Lands' Office, of the applicant's age, family, and means of settlement, upon which, if approved, authority for location will issue. 4thly, The tickets issued will be useless to any but the applicants, and unless presented to the agent within one month from the date, they will not be received by him. Any person who shall receive a ticket, and who shall not proceed to the settlement within one month; or who, having been placed upon land there, shall abandon it, will be considered as having lost all claim to receive land. 5thly, Settlers will be required to clear, and place once under crop, one-third of the land located, and to reside on the land until this settlement-duty is performed; and after one-third of the grant shall have been cleared and under crop, the settler shall be entitled to his patent, free of expense. 6thly, The settlement-duty is required to be done within four years from the date of the ticket. 7thly, Settlers who are under the necessity of being temporarily absent from their locations, will apply to the resident agent, stating the length of their intended absence, and the reason for it, which will be entered on the agent's book, if the reason for absence seems sufficient; and any person who shall absent himself, without being permitted to do so by the agent, or who shall remain away from the settlement for a longer time than such permission shall authorise, will be considered as having forfeited his location. 8thly, An assignment, or attempt to assign any ticket or location, will also be considered as a forfeiture of all right in the locatee or the assignee; or if it shall appear that the locatee has previously obtained a grant of land from government, his new location shall be forfeited. 9thly, In all cases of abandonment of location, the located land will be considered immediately open for new location or sale. 10thly, As it is not the intention of the government to offer the settlers any assistance, further than the free grant of land, and the opening of the road, applicants are specially desired to consider for themselves, whether or not they have the means of maintaining themselves and their families until crops can be raised from the ground.

Government agents have been appointed at the northern and southern extremities of the settlement, and further information may be obtained on application to Mr John Telfer, Owen's Sound, and Mr James M'Nabb, Garrafraxa. R. B. SULLIVAN, Commissioner Crown Lands."

The letter of reply to our correspondent, dated "Emigrant Office, Montreal, 9th Ootober 1841," is as follows:—

"Sir—The gentlemen composing the Emigrant Society here, placed your letter (dated 23d August) in my hands, in reply to a considerable portion of which I have deemed it not amiss, for your information and that of your farming acquaintance, to send the annexed printed notice. Land may be had on the same principle at the Kennebec and Lambton settlements, in the lower part of the province, by the intending settler applying, on his arrival at Quebec, to A. C. Buchanan, Esq., Chief Emigration Agent.

Healthy settlers, who are steady, industrious, and economical, cannot fail in rapidly improving their condition in this truly fine country. Farmers, farm-labourers, coopers, joiners, blacksmiths, brickmakers, bricklayers, stone-masons, plasterers, and common carpenters, generally succeed well in this country. It would be well to bring out all your tools. All intending settlers should endeavour to reach here on or before the 1st of June, especially agriculturists; and I consider it highly imprudent of any man to quit his native country without feeling confident that he has sufficient means to support his family at *least* two or three months after his arrival here. By you and your friends calling at my office on your arrival, it will be to me a pleasurable duty to afford you *all* such information as I humbly conceive (from twenty-seven years' experience) is calculated to render essential service. It is a matter of course, that those who can bring most money and property, are, with good management, likely to prosper most rapidly; you, as an industrious joiner, will doubtless do well in this country, especially by having at the same time from fifty to one hundred acres of good land, in an eligible situation, upon easy terms of payment, which, no doubt, I can put you in the way of obtaining—though the first instalment (especially should there be a few acres cleared and a small hut upon it) is generally expected to be paid about the time of taking possession of it. It may be necessary for me to observe, that no kind of emigrants receive government aid in being forwarded to work, except such as are totally destitute, with large families.

Improved farms can be purchased on favourable terms. Practical British farmers, with some means, always succeed remarkably well here: by prudence and perseverance, their capital increases rapidly. For the general good of your friends and the public, should you see fit to make it known, I deem it proper to observe, that men engaged in the silk, cotton, or woollen manufactures, such as weavers, spinners, printers, dyers, &c., will at this time find no employment here in their respective callings, and are obliged to betake themselves to the task of the day-labourer, and cannot at all times during the season be certain of obtaining that employment; and but few of these classes that have reached forty or forty-five years of age become expert labourers, and when they settle on land, the process of clearing is slowly and unskilfuly executed, and poverty, as their lot, is scarcely to be avoided. I have the honour to be, &c., JAMES ALLISON, General Emigration Agent, Montreal."

† Hone's Year Book, 1599.

DULL TALKERS.

Some praters are so full of their own gabble, and so fond of their own discord, that they would not suspend their eternal monotonies to hear the wit of Sheridan or the point of Swift; one might as well attempt to stop the saw of a task-working stone-cutter by the melodies of an Æolian harp. Others, again, there are who hide that ignorance in silent gravity that these expose by silly talk, but they are so coldly correct, and so methodically dull, that any attempt to raise the slumbering sparks of genius by means of such instruments, would be to stir up a languishing fire with a poker of ice. There is a third class, forming a great majority, being a heavy compound of the two former, and possessing many of the properties peculiar to each; thus, they have just ignorance enough to talk amongst fools, and just sense enough to be silent amongst wits. But they have no vivacity in themselves, nor relish for it in another—to attempt to keep up the ball of conversation with such partners, would be to play a game of fives against a bed of feathers.—*Lacon.*

HOOD'S COMIC ANNUAL.

This lively little work holds on in its annual career, as full of jokes as ever, the quality of the material being no way deteriorated from that of former years. In the volume which made its appearance at the beginning of 1842, we find the following clever *jeu d'esprit* on the practice of asking for autographs. It purports to be a letter from Mr Hood to D. A. A., Esquire, Edinburgh:—

"Sir,—I am much flattered by your request, and quite willing to accede to it; but, unluckily, you have omitted to inform me of the sort of thing you want. Autographs are of many kinds. Some persons chalk them on walls; others inscribe what may be called auto-lithographs, in sundry colours, on the flag-stones. Gentlemen in love delight in carving their autographs on the bark of trees; as other idle fellows are apt to hack and hew them on tavern benches and rustic seats. Amongst various modes, I have seen a shop-boy dribble his autograph from a tin of water on a dry pavement. The autographs of the Charity Boys are written on large sheets of paper, illuminated with engravings, and are technically called Pieces.' The celebrated Miss Biffin used to distribute autographs amongst her visiters, which she wrote with a pen grasped between her teeth. Another, a German Phenomenon, held the implement with his toes. The Man in the Iron Mask scratched an autograph with his fork on a silver plate, and threw it out of the window. Baron Trenck smudged one with a charred stick; and Silvio Pellico, with his fore-finger dipped in a mixture of soot and water. Lord Chesterfield wrote autographs on windows with a diamond pencil; so did Sir Walter Raleigh and Queen Elizabeth. Draco, when Themis requested a few *sentences* for her album, dipped his stylus in human blood. Faust used the same fluid in the autograph he bartered with Mephistopheles. The Hebrews write their Shpargotua backwards; and some of the Orientals used to clothe them in hieroglyphics. An ancient Egyptian, if asked for his autograph, would probably have sent to the collector a picture of what Mrs Malaprop calls 'An Allegory on the Banks of the Nile.' Aster, the archer, volunteered an autograph, and sent it bang into Philip's right eye. Some individuals are so chary of their handwriting, as to bestow, when requested, only a mark or cross; others more liberally adorn a specimen of their penmanship with such extraneous flourishes as a cork-screw, a serpent, or a circumbendibus, not to mention such caligraphic fancies as eagles, ships, and swans. Then, again, there are what may be called Mosaic autographs, *i. e.* inlaid with cockle-shells, blue and white pebbles, and the like, in a little gravel walk. Our grandmothers worked their autographs in canvass samplers; and I have seen one wrought out with pins' heads on a huge white pin-cushion, as thus:—'Welcome sweat Babby. Mary Jones.'

When the sweetheart of Mr John Junk requested his autograph, and explained what it was, namely, 'a couple of lines or so, with his name to it,' he replied that he would leave it to her in his will, seeing as how it was 'done with gunpowder on his left arm.'

There have even been autographs written by proxy. For example, Doctor Dodd penned one for Lord Chesterfield; but to oblige a stranger in this way is very dangerous, considering how easily a few lines may be twisted into a rope. According to Lord Byron, the Greek girls compound autographs as apothecaries make up prescriptions, with such materials as flowers, herbs, ashes, pebbles, and bits of coal. Lord Byron himself, if asked for a specimen of his hand, would probably have sent a plaster cast of it. King George the Fourth and the Duke of York, when their autographs were requested for a keepsake, royally favoured the applicant with some of their old Latin-English exercises. With regard to my own particular practice, I have often traced an autograph with my walking-stick on the sea-sand. I also seem to remember writing one with my fore-finger on a dusty table, and am pretty sure I could do it with the smoke of a candle on the ceiling. I have seen something like a very badly scribbled autograph made by children with a thread of treacle on a slice of suet dumpling. Then, it may be done with vegetables. My little girl grew her autograph the other day in mustard and cress. Domestic servants, I have observed, are fond of scrawling autographs on a teaboard with the slopped milk; also of scratching them on a soft deal dresser, the lead of the sink, and, above all, the quicksilver side of a looking-glass—a surface, by the by, quite irresistible to any one who can write and does not bite his nails. A friend of mine possesses an autograph—'Remember Jim Hoskins'—done with a red-hot poker on the back-kitchen door. This, however, is awkward to bind up. Another, but a young lady, possesses a book of autographs, filled just like a tailor's pattern book, with samples of stuff and fustian. The foregoing, sir, are but a few of the varieties; and the questions that have occurred to me in consequence of your only naming the genus, and not the species, have been innumerable. Would the gentleman like it short or long? for Doppeldickius, the learned Dutchman, wrote an autograph for a friend, which the latter published in a quarto volume. Would he prefer it in red ink, or black—or suppose he had it in sympathetic, so that he could draw me out when he pleased? Would he choose it on white paper, or tinted, or embossed, or on common brown paper, like Maroncelli's? Would he like it without my name to it—as somebody favoured me lately with his autograph in an anonymous letter? Would he rather it were like Guy Faukes's to Lord Monteagle (not Spring Rice), in a feigned hand? Would he relish it in the aristocratical style, *i. e.* partially or totally illegible? Would he like it—in case he shouldn't like it—on a slate? With such a maze to wander in, if I should not take the exact course you wish, you must blame the short and insufficient clue you have afforded me. In the mean time, as you have not forwarded to me a tree or a table—a paving-stone or a brick wall—a looking-glass or a window—a teaboard or a silver plate—a bill-stamp or a back-kitchen door—I presume to conclude that you want only a common pen-ink-and-paper autograph; and, in the absence of any particular direction for its transmission, for instance, by a carrier-pigeon, or in a fire-balloon, or set adrift in a bottle, or per waggon, or favoured by Mr Waghorn, or by telegraph, I think the best way will be to send it to you in *print*.—I am, sir, your most obedient servant, Thomas Hood."

ON THE DEATH OF A BOY.

The autumn leaves are fading fast,
And rustling in the chilly blast;
And some around us, old and grey,
Have fallen scar'd, and fast as they.

But weep not, weep not, theirs had been
A sunny morn, a noon serene;
And in the evening of their day
They laid them down, and slept away.

Yet, why these tears upon my cheek?—
These woman's yearnings wildly weak?—
These longings for the dear, the dead—
The early rose, whose leaves are shed?

No more on earth that little hand
With brother's love shall clasp mine own—
Like bird to a far distant land,
That voice (to *me* so sweet) is flown.

A fibre from my heart is riven!
A life-drop from my heart is shed!
Ay! but thy spirit—*that's* in Heaven—
'Tis but the *dust* that's with the dead!

I'll gaze on yon bright star, and see
The home where thou art dwelling now—
Methinks soft wings are fanning me—
They soothe, they cool, my fever'd brow!

I'll listen to the wind's soft swell,
And fancy thine the gentle sounds;
They sigh not forth a sad farewell—
Thus in my ear the murmurs dwell,
"We'll meet where endless love abounds!"

I'll weep no more—no more I'll sigh!
I feel, dear boy, thy presence nigh;
And still, methinks, thy spirit clings
Around me in my wanderings.

A. G.

ENLIGHTENED ENTERPRISE.

A little enlightened enterprise in a single individual, comparatively obscure, often leads to great results; and therefore no man, in his efforts to begin any branch of trade, should be discouraged either because he is unknown to fame or possesses slender means of immediate success. Enterprise on a small and at first unheeded scale, is indeed the foundation of almost all great professional undertakings. We have a striking and honourable instance of this in the history of type-founding in Scotland. Exactly a century ago, types were for the first time cast in Scotland, and a trade begun in an article for which our northern kingdom is now highly celebrated. The introducer of this elegant art was Alexander Wilson, a native of St Andrews, at whose university he received a liberal education. After completing his studies, he went to London, and, while studying medicine in the British metropolis, he accidentally visited a type-foundry, where a close examination of the process convinced him that he could effect great improvements in the art. He communicated his ideas to an acquaintance, also a native of St Andrews, and they removed to that city in 1742, where they opened a foundry, at which, as already observed, the first types in Scotland, worthy of the name, were cast. Their success exceeded their most sanguine expectations, and their increasing connexion with Ireland induced them to remove the foundry to Glasgow in 1744, where it rapidly obtained a remarkable celebrity, and where Mr Wilson was so highly esteemed as a man of science, that he was appointed professor of astronomy in the university. This venerable gentleman left a family, who inherited his abilities; his grandsons now carry on most extensive foundries of types in Edinburgh, London, and Dublin; and from their own and their father's establishment have gone forth other founders, whose taste and skill have added to the glory of the profession. Young men inclined to feel daunted with obstacles may treasure these valuable facts in their remembrance.

CAPTAIN TAYLER'S BREAKWATER.

Various notices have lately been given in the newspapers of this invention. It is well known that in severe storms on our coast, ships are not safe even in certain harbours, the sea rolling in upon them with immense fury; hence the plan of building breakwaters, or huge mounds of masonry, opposite the mouths of harbours, by which the force of the sea is lessened. But this method of protecting harbourages being excessively expensive, Captain Tayler, of the Royal Navy, has invented a breakwater which floats, and, while answering all the purposes of a solid breakwater, can be placed at perhaps a hundredth part of the expense. His scheme is so simple and ingenious, that it seems wonderful it was not thought of sooner. It consists of placing in the water an obstacle which will yield to the action of the waves, yet deprive them of their violence. Here we are called on to recollect that, when waves advance, it is not the water which is advancing, but the force which has been communicated to the water. The rolling force of the waves, then, according to Captain Tayler's plan, and as far as we understand it, is to be met by a hollow framework, which receives it and brings it to a calm. If the obstacle were solid, it would be beat to pieces; but being open, it is constantly filled with water, and this water receives the force into its tranquil bosom. Moored off the most iron-bound coast, this species of breakwater will afford a retreat to any number of vessels, and be the means of saving much life and property. It is pleasing to find science thus extending her operations in the cause of humanity and national advancement.

MEMORY.

Dr Rush of America relates two or three very pleasing anecdotes of the freshness with which the memory preserves the rural scenery of early life:—When the physician visited a sick woman whom he had known in childhood, she was lying in typhus fever, and all hope of her recovery was nearly over. Two little words, like a fabulous talisman, seemed to bring back her wandering thoughts. The "eagle's nest" was the brief exclamation of Dr Rush. The tree had grown upon her father's farm; and all the scenery of her youth grew up again at the mention of it. From that moment she began to recover. Another fact, of a different description, is related by the same author:—An Italian gentleman died in New York, of yellow fever. In the beginning of his illness he spoke English; in the middle, French; at the close, Italian. These anecdotes correspond in illustrating the mysterious revival of memory amid the gloom of life, and when the sun had almost set. The vivid distinctness of the recollection, at the last hour of existence, is not more remarkable than solemn.—*Fraser's Magazine.* [We believe that the revival of recollection near death can be accounted for physiologically: it has been stated to us, that the activity of the brain at that period, is a result of the great effort which nature makes to rally, and throw off the cause of disease. The renewed recollection of a forgotten language has been explained by phrenologists.]

POPULAR DELUSIONS.

Maitland, in his "History of London," gravely informs us, that one of the projects which received great encouragement, was for the establishment of a company "to make deal-boards out of saw-dust." This is, no doubt, intended as a joke; but there is abundance of evidence to show that dozens of schemes, hardly a whit more reasonable, lived their little day, ruining hundreds ere they fell. One of them was for a wheel for perpetual motion—capital one million; another was for "encouraging the breed of horses (in England), and of improving of glebe and church lands, and repairing and rebuilding parsonage and vicarage houses." Why the clergy, who were so mainly interested in the latter clause, should have taken so much interest in the first, is only to be explained on the supposition, that the scheme was projected by a knot of the fox-hunting parsons once so common in England. The shares of this company were rapidly subscribed for. But the most absurd and preposterous of all, and which showed, more completely than any other, the utter madness of the people, was one started by an unknown adventurer, entitled, "A company for carrying on an undertaking of great advantage, but nobody to know what it is." Were not the fact stated by scores of credible witnesses, it would be impossible to believe that any person could have been duped by such a project. The man of genius who essayed this bold and successful inroad upon public credulity, merely stated in his prospectus that the required capital was half a million, in five thousand shares, L.100 each, deposit L.2 per share. Each subscriber, paying his deposit, would be entitled to L.100 per annum per share. How this immense profit was to be obtained, he did not condescend to inform them at that time, but promised that in a month full particulars should be duly announced, and a call made for the remaining L.98 of the subscription. Next morning, at nine o'clock, this great man opened an office in Cornhill. Crowds of people beset his door; and when he shut up, at three o'clock, he found that no less than one thousand shares had been subscribed for, and the deposits paid. He was thus, in five hours, the winner of L.2000. He was philosopher enough to be contented with his venture, and set off the same evening for the continent, and was never heard of again.—*Mackay's History of Popular Delusions.*

THE SUMMERS FROM 1816 TO 1841.

1816—Extremely cold and wet throughout: one of the worst harvests ever known. 1817—Very cold and wet in July and August, but very fine in September, which favoured the harvest. 1818—Intensely hot and dry; the thermometer twice at 89 degrees, and often above 80 degrees. 1819—A very fine hot summer: the month of August intensely hot: scarcely any thunder. 1820—A fine summer on the whole, and very productive. 1821—Some very hot days occasionally, but for the most part cold and showery. Immense rains during harvest, which did great damage. 1822—A splendid year: hot and dry for the most part, but heavy rain at times, with much thunder. A very abundant harvest. 1823—A very cold showery summer. In July it rained every day except the 24th: very little thunder. 1824—Very fine and warm throughout, but never intensely hot. The thermometer stood highest September 1, and was at 79 degrees. 1825—Very hot almost throughout. July 18, the thermometer stood at 90 degrees, which is the highest observation in the course of all these summers. 1826—The hottest and driest summer ever known: it began early and continued late. The thermometer was twice at 88 degrees, and often at 84 degrees. 1827—Hot and dry, but not to such an extremity as in the preceding summer: much thunder. 1828—Immense rains, which began July 9, and continued almost without cessation. Large floods July 16 and 30. Heavy thunder-storms; bad harvest. 1829—A very cold stormy summer. In September the rains were very heavy. In 1830—Very cold and wet, especially in June: much thunder. 1831—Warm, gleamy, showery, and electrical. A sickly summer; great number of insects, especially house flies. 1832—Moderate for the most part, without much inclination either one way or the other. 1833—Very fine, the early part especially; an abundant harvest. 1834—A very fine hot summer, but heavy rains at the end of July; an early and productive harvest. 1835—Hot and dry, with some showery exceptions; another abundant harvest. 1836—In the midland counties dry weather predominated. Remarkable for the almost entire destruction of the turnip crop by the fly. Harvest not amiss. 1837—A fair average of hot weather, but preceded by a very severe spring; harvest deficient. 1838—A cold wet summer, and a late unproductive harvest. 1839—Very heavy rains, almost without cessation; the harves not unproductive, but much damaged. 1840—A fine warm summer, with intense heat in August: fine harvest weather; feed deficient. 1841—Fine and warm in May and June; wet and cold in July and the beginning of August; fine harvest weather at the end, and in September.—*Farmer's Almanac.*

NUMBER 524. SATURDAY, FEBRUARY 12, 1842. PRICE 1½*d*.

ECCENTRIC MORALS.

THE natural feelings are subject to many strange aberrations and depravities. The Negro of Soudan would probably pronounce the most beautiful lady at Almack's a fright, and point for the true standard of loveliness to some overgrown black Venus, the result of ten years of maternal cramming. The African gentleman's taste would be held by some to imply that the ideas of men on these points are all matter of habit or prejudice; but this would be rather a rash way of judging. The wonder may, we think, be accounted for by supposing that the faculty giving the sense of the beautiful has been in him dormant for lack of all that could excite or train it, and that habit and prejudice have only reconciled him to an object absolutely not calculated to be agreeable to this feeling in most men. In the same way, we conceive, some men become accustomed to swallow with a kind of relish potions which to the bulk of mankind appear, and therefore really are, bitter and nauseous. The tale told of a king of antiquity, who, by taking poison in little but gradually increasing quantities, came at last to be a mass diffusing death all around, while himself remained in good health, is, though evidently an exaggerated case, yet one generally consonant with what we know to be possible: otherwise how should Coleridge have been able to take a pint of laudanum in a day? There have even been appetites so depraved, that the mud of the streets became a treat—though, probably, in such cases, it is not the perversion of habit so much as the derangement of disease. It would not perhaps be more absurd to conclude from such instances that man had no natural election between a good joint and a lump of soil, than to suppose, because the Negroes admire ugly objects, that there is no *to kalon*, or absolute *beautiful*.

So it is with almost all the finest feelings of our nature. To observe the conduct of mothers in this country, one would suppose that the protection of the infant was a principle in no instance to be broken through. An English lady seems to experience the bitterest agonies of alarm and distress, if the least danger of any kind threaten the helpless innocent that lies in her bosom. Here, at least, we would think, is a feeling which nothing on earth could corrupt or pervert. Yet, unfortunately, we know that the Spartans exposed deformed or sickly children, and that Roman parents had by their laws a right to do so; that the Mingrelians, a people who professed Christianity, were accustomed to bury their offspring alive, with the view perhaps of repressing population; and that the Chinese practise infanticide on a large scale. Such things, however, do not argue that there is no natural feeling dictating a love of and care for the young, and that all these things are only matters of custom. They only, in our opinion, show that the feeling may be weak and comparatively dormant in some nations, as we know it to be in some individuals amongst ourselves, or else may be overpowered by some principle temporarily stronger. The Mingrelians and Chinese may be amongst those nations who have no great endowment of the faculty which gives the love of children; and, in the case of the Spartans, we all know that their regard to the public interest was sufficient in them to subdue the natural feeling, even on the supposition of its being of average strength and activity. It is worthy of remark, that the vivacity of this feeling does not absolutely depend on civilisation: while the Chinese murder their infants, the Esquimaux, a much less enlightened people, are remarkable for an extreme tenderness towards them. Nor does this feeling always rise in proportion with the respectability of the lower animals: the felinæ and apes are perhaps the most philoprogenitive of all creatures.

Parental and filial affection are recognised as strong feelings amongst us, and it is difficult to imagine how a son could ever become an indifferent object to a father, or how a mother could ever regard the death of one of her stately striplings as even a tolerable, much less a pleasing, event. Yet a Roman magistrate would coolly condemn his son to death for a state offence; and a Grecian mother was delighted to receive home, stretched on his shield, the lifeless body of the youth who had fallen fighting for his country. Aksoukor Bourshi, the Dispenser of Fortune, as he was called, a gallant prince of Mossul, fell a victim to the daggers of a fanatical sect whose creed recognised assassination as the most meritorious of all acts. The populace seized the murderers, whom, with one exception, they tore in pieces. The mother of the assassin who was spared, hearing of the catastrophe, expressed the greatest joy, and dressed herself in all her finest attire, believing her son to have been killed in what she believed to be the best of causes. When she learnt that the young man still lived, she blackened her face, and cut off her long flowing hair, the eastern signs of extreme woe. In all these cases, we see one principle overpowering another, the latter, however, being probably, in some of these nations, the weaker of the two naturally.

There can, we think, be no other rational way of accounting for those eccentricities as to morals for which some nations have been remarkable. Lycurgus, as is generally known, legalised theft, and only punished it when a blundering rogue was caught in the fact. He was so eager to make his people intellectually sharp, that this license did not seem too dear a way of effecting the object. So also the Grecian philosophers, in their anxiety to advance their national interests, not only sanctioned piracy, but held it to be laudable. The whole history of Greece is a remarkable illustration of the power of a sentiment akin to what we call public spirit, to extinguish the natural emotions of the individual bosom.

Even the instinct of self-preservation, so universally active, the mainspring of human actions, has been, as we well know, overpowered by other feelings. The Hindoo devotee prostrates himself under the car of Juggernaut in a most contented and cheerful state of mind. The widow of the same nation, if left to her choice, in general would rather burn with her deceased husband than not. They think they are making a good bargain in so doing, and, firm in their faith, no qualm comes over them. The Highlander of old would gladly take the death-blow aimed at his chief, so that he could save that venerated person. Here the sacrifice was dictated by merely a habit of reverence, which made the chief's life seem preferable to his own. He contemplated no selfish advantage, but, on the contrary, made a pure sacrifice of self. Yet it was only one feeling, after all, overpowering another.

Our common notions respecting the destruction of a fellow-creature, in other circumstances than those of conflict, or for the purpose of self-defence, represent it as an act from which man instinctively revolts, and which, if it be unfortunately committed, is ever after a source of the most bitter uneasiness of feeling. We think of the murderer as haunted through life with horrible recollections, harassed by remorse, and suffering an expiatory death every day, until true death at length comes, amidst unspeakable horrors, to close a scene which no one can look on without shuddering. It is, nevertheless, true that there are large bodies of people who practise murder without the experience of the slightest uneasiness either at the moment or afterwards. Such are the Thugs of India, of whom various well-authenticated accounts have been presented to the public within the last few years. They are a kind of sect, or set of religionists, who waylay and kill travellers for the sake of booty. "There is not a Thug," says Captain Sleeman, "who feels the slightest remorse for the murders which he may, in the course of his vocation, have perpetrated, or assisted in perpetrating. A Thug considers the persons murdered precisely in the light of victims offered up to the goddess; and he remembers them as a priest of Jupiter remembered the oxen, and a priest of Saturn the children, sacrificed upon their altars. He meditates his murders without any misgiving; he perpetrates them without any emotion of pity; and he remembers them without any feeling of remorse. They trouble not his dreams, nor does their recollection ever cause him any inquietude in darkness, in solitude, or the hour of death." How are we to reconcile the rule, in this case, with so large and every way so remarkable an exception? It is also to be remembered that there has been such a thing as a nation of assassins somewhat nearer to our doors than the Thugs; and that, within Christendom, religion has often been brought to bear either for the prompting of homicide or its justification. When Louis D'Orleans assassinated Jean Sans Peur in 1407, Jean Petit, a Norman Cordelier monk and doctor of laws, undertook to justify the act by *twelve* arguments in honour of the twelve apostles! The Smithfield fires were lighted, and the bell of St Germain l'Auxerrois was rung, for the supposed glory of God. John Knox "spoke merrily" of the murder of Cardinal Beaton, and united himself to the murderers, although of the general character of that preacher there cannot be a doubt that it included many noble points. We would have to write volumes instead of paragraphs, if we were to dip deeper into the annals of religious persecution; suffice it, in one word, to say that, from beginning to end, they show the natural feelings of humanity obscured by the predominance of other and depraved feelings.

The aberrations of the religious feeling itself are most extraordinary, and such as investigation would perhaps never exhaust. The first element of this feeling is unquestionably the principle of worship—and to what objects has worship been paid, from the ugly caricatures of humanity which some Asiatic nations set up as idols, to the Grecian Jupiter and Apollo, respective emblems of majesty and beauty—from the sacred cow of Egypt to the Lama of Thibet! Worship implies an object presumedly superior to the worshipper; but these objects could never be rationally held superior to those who pay or have paid them reverence. Yet they were or are sincerely, devoutly worshipped. Between the true object, an Almighty Unseen Deity, and these substitutes of ignorance and delusion, what an interval! Yet still there can be no doubt that the veneration of men has been, and is, excited by such objects.

The sense of justice and truth is not less liable to depravation. Of truth, barbarous nations have scarcely a trace; of justice, they have very little. Some semi-enlightened nations, as, for example, the Chinese, are scarcely any better in either respect. And even amongst the most enlightened nations, we find some odd ideas and practices. It is not assuming at all, but only stating a recognised fact, that there are scores of voters in almost every borough in England, who cannot see the least impropriety in selling their votes for a sum of money, and would be prepared to defend the act as one perfectly indifferent in all respects except with a regard to their own interest. Classes

pursue their own interests, not only without the least regard to the interests of other classes, but in open defiance of them. We find each profession and set of men looking to some code of its own, which habit places above the decalogue in their estimation. A barrister will use every effort to save from conviction the wretch who cannot be allowed to continue in his career without the greatest danger to society; and a statesman will denounce a minister as a traitor to his country and an enemy to the laws, yet be ready next minute to protest that he only meant the charge in a parliamentary sense, and entertains not a thought injurious to the personal character of his opponent. All of these are great monstrosities; but we pass them by every day without remark, custom having reconciled us to them.

On attempting to analyse the various causes which produce aberrations of the natural feelings, we find reason to think that the following are the chief. There is, first, that condition of a feeling which we find in utterly savage tribes—a state in which it is either so small in positive endowment, or so ill developed, that it scarcely can be said to exist at all. Hence the African's admiration of fat black females—the unscrupulous destruction of children by some savage tribes—the veneration which many other barbarous nations pay to ugly blocks of wood or stone, as supposing them to be gods. In these cases we only see the blundering of a faculty as weak and aimless as the movements of a newly born animal. There is next a condition of a faculty little superior to the above, which is sometimes found in partially civilised nations: for example, the feeble state of conscientiousness amongst the Chinese. Here we may remark that, because a nation has made some progress, it is not to be supposed that all the mental faculties are, in it, to spring forward into one uniform degree of activity. There is not one partially enlightened race which does not show some striking deficiencies. A great deal of the shortcomings which we wonder at in certain races are to be attributed to this cause. Next, we behold, in civilised nations, one feeling overpowered by another—as the family affections of the Greeks by public spirit, and their sense of justice by an anxiety to cultivate intellectual sharpness. The monstrous practices of Thugs, assassins, and persecutors, are to be explained by a consideration of the blinding effect of erroneous religious views. Absorbed in some delusive notions, these persons come to sink all considerations of justice and humanity, and are willing to commit any species of wickedness that a contemplated greater good may be attained. It is a great though common mistake to speak of such men as unacquainted with mercy: Philip II. of Spain, while conducting his atrocious persecutions in the Netherlands, sent bread and clothing to the people of Brussels suffering under a famine. The feelings are in their case only overcome by an extreme of fanaticism, against which judgment makes no appeal. Next, there are many aberrations which arise from interested and selfish views entertained by a great body of men. In that case, probably, a consideration that the object sought is for the benefit of many others besides one's self, reconciles many to the error, or is what makes it appear passable. Every one, too, feels his share of the responsibility so light, and is so supported in his error by multitudes around him, that he is encouraged to stand out in the bad cause. Finally, the peculiar arrangements which society takes, and the effects of laws and institutions, occasion many anomalous moralities, to which custom easily reconciles all the parties concerned.

But while every one of the feelings is thus liable to appear, under various circumstances, dull, dormant, vanquished, or depraved, we are assured that such feelings nevertheless exist, by finding them all acting with vigour in some one or another of the children of men. That there *is* a feeling for the beautiful, Greece and Italy have amply proved. There *is* a fundamental feeling to pronounce thieving wrong, because most nations in the least removed from the savage condition pronounce it to be so. There *is* a feeling to protect the young, because, though some few kill them, the great mass consent in acting quite otherwise. There *is* a right humanity, because, while a few have been found to act mercilessly, and without remorse, the bulk of mankind are inclined quite the contrary way. All the peculiar morals, then, of which instances have here been given, are only eccentricities, or departures from a right code. The practical good to be deduced from the argument, is its giving us a light to detect the moral fallacies into which custom and prejudice are apt to lead us. It prompts us to look out beyond the narrow circle of local, temporary, and class morals, to see the operation of just principles in the great world. It is a common resource of the unjust and merciless to sneer at all standards of right and wrong, and take refuge from blame in the many examples of the aberrant and depraved. The more clearly that these can be established in their true character, as only exceptions from rules which the Creator has himself written in the human heart, the less influence, it may be presumed, will they have in seducing the easy and weak from the right path.

"ENGLAND IN THE NINETEENTH CENTURY."*

This is a work after the fashion of Mrs Hall's "Ireland," in form, embellishment, and mode of publication, as well as in the matter and manner of the composition. Two "parts" are published, the respective commencements of two series into which the work is divided (Southern and Northern), and respectively devoted to Cornwall and Lancashire. When we contrast the aptness and elegance of the wood and steel engravings, the beauty of paper and print, and the liveliness and intelligence of the writing, with the corresponding features of "The Beauties of England and Wales," we are disposed to think that as great improvements have been made, during the last thirty years, in the business of preparing books, as in any other constructive business followed in England. We cordially recommend the book to our readers, as one calculated at once to grace their drawing-rooms, and to acquaint their children with what is too much overlooked in education—the topographical and social features of their native country. We would instance the well-written and well-illustrated account here given of the Lancashire factory system, as a very remarkable example of the efforts now made to gratify and enlighten the public through media the most humble. We find that the southern division is under the care of Mr Cyrus Redding, and the northern under that of Dr W. C. Taylor.

The peculiar features of Cornwall, as a store of almost every kind of mineral wealth, and the seat of a population in many respects different from the rest of the English people, are well brought out by Mr Redding. The reader is surprised to be informed that traces of the ancient connexion of the Phœnicians and Jews with Cornwall are to be found in various Hebrew names of places, as Paran-zabulon, Phillack, Menachan, Zephni, Bonithon, and Marazion. The inhabitants are remarked to be people of kind and agreeable manners—the men larger and more active than most Englishmen, and the women peculiarly unaffected and free from constraint. It appears that Queen Elizabeth remarked, that "the Cornish gentlemen were all born courtiers, with a becoming confidence," a description that would have applied equally well to the gentlemen of the kindred race of Scottish Highlanders in the last century, and perhaps to the *real* Irish gentlemen of the present day, thus marking the ineffaceable characteristics of races.

At Week St Mary there is a charity and grammar-school, founded in the time of Henry VIII., by a lady who was a native of the place, and whose history, as Mr Redding remarks, would do well for a romance. Thomasina Bonaventura, when a girl, kept sheep upon the neighbouring moor. "A London merchant, who happened to be travelling that way, saw her, and observing something about her which pleased him, begged her of her poor parents, and took her to London. The wife of the merchant dying, her master was so taken with her comeliness 'and her good thewes,' say the historians of the day, that he married her, and left her a rich widow. She married a second husband, and was a second time left a widow. A third time she married a Sir John Perceval, who was Lord Mayor of London; and outliving him, she retired to her native parish, and employed her fortune in useful purposes. She repaired highways, built bridges, endowed maidens, released prisoners, and clothed the poor. In her will, which is extant, dated 1512, it is found that her first husband's name was Thomas Bumsby. She bequeaths legacies to a brother; and makes a 'cousin,' named Dinham, who married her sister's daughter, legatee, leaving to him the care of her grammar-school. To the vicar of Liskeard she leaves a gilt goblet, to remind him to pray for her; and twenty marks towards building the church of St Stephen, at Launceston."

Near an old place called Stratton, our author found a smart little watering-place, called Bude Haven, getting up, with an excessively smart little hotel, and a great deal of petty bustle. Pretension—the sin of English society—is just budding. "This judgment we formed from a sentence which dropped from a waiter at the hotel—a female, as many of the waiters are in Cornwall. The bell was rung.

'Did you ring, sir?'

'A little water; there is none in the tea-pot.'

'Yes, sir.'

'Can't you bring in a tea-kettle?'

'The urn is coming, sir; we don't use tea-kettles, like the Stratton people,' with a slight flourish of the head. There was something unpromising in this remark—this incipient effort to be exclusive—it was not a good omen. Stratton was an ancient town when Bude was a sand-bank.

'I shall be obliged for some toast, Mary; but, perhaps, the Stratton people only eat toast?'

'Yes, sir,' replied Mary, blushing as if she felt the reproof, and going out of the room after the toast.

'They do that at Stratton,' may in future serve for a gibe at any thing done out of the mode."

Dr Taylor, in approaching the subject of the factory system, disclaims the power of thoroughly comprehending or describing it. "Some influences are too extensive, others too minute, and all are in such constant action, that it is scarcely possible to find the moment of repose when an examination of their constituent parts might be attempted. Even those who have resided in the manufacturing districts all their lives, and who have been neither incurious nor uninterested spectators of the changes which machinery has wrought, are ready to confess that there is much in the system which either escapes their ken or baffles their comprehension; that there are agencies at work, viewless as the wind—'they hear the sound thereof, but cannot tell whence it cometh or whither it goeth;' and this must necessarily be the case; for, until machinery has worked out all its results, the condition of society which it produces must be regarded as in a state of transition.

Transition is necessarily associated with doubt—we know what we are, but know not what we may be—there are those who hope for change, and there are those who fear it. These feelings are not always the dictates of self-interest: hope from change often arises from nobler causes than dissatisfaction with the existing state of things, and fear of change must not always be attributed to the dread of seeing advantages afforded to the many, which are now monopolised by the few; men on all sides are actuated by better motives than those for which their opponents give them credit: the errors most commonly attributed to principles will in the great majority of instances be found to arise from false or imperfect perceptions of facts."

After a full description of the actual mechanism of the factories, he adds—"The most scrupulous attention is paid to cleanliness in almost every mill; those which were exceptions are fast disappearing. But cleanliness is found in Manchester where it would be least expected, among the firemen and attendants on the boilers. The coals are raised from their bins in a yard by a series of buckets, similar to those of the dredging machines used for deepening the beds of rivers; thence they are emptied into a waggon with a drop-bottom, which moves on a railway over the feeding-hoppers attached to each furnace, and are supplied to the fires in the exact proportion required to generate steam necessary for the work.

Not only are the floors and walls kept free from the slightest impurity, but the overseers take care that the children should keep themselves neat. They go round every morning, and reprove those who have failed to wash themselves after breakfast; the delinquents are without excuse, as soap, water, and towels, are provided gratuitously for their use. In many mills, boxes and nests of drawers are provided, in which the female operatives deposit their street dresses, and put on their working clothes before they begin their labours. There is also a separate washing and dressing room for the women, from which, as well as from their other places of retirement, the male operatives are carefully excluded. We have been much interested by observing the difference of appearance between the females when at work, and when they are going home to dinner; they do not exhibit any trace of their occupation when they appear in the street; many of them, indeed, display in the arrangement of their dress and person a neatness and taste not unbecoming a higher walk of life.

The proper ventilation of the rooms is now regarded as an object of primary importance in the construction of mills. Taylor's mill, near Preston, is in this respect a perfect model; it has in every room a double system of ventilators—the series at the top of each room removing the foul air, while fresh air is supplied by those near the floor.

The mills are warmed by steam-pipes, from which some portion of the steam is permitted to escape and mix with the surrounding atmosphere. A moist warm temperature is essential to the perfection of cotton manufactures, and especially to the spinning of the finer yarns; but the influence of such an atmosphere on the health of the operatives appearing questionable, we sought information from various medical gentlemen who had enjoyed long opportunities for observing the vital statistics of factories. They unanimously condemned the system of warming apartments by stoves or hot-air pipes;* they declared that a dry heated

* London: How and Parsons. 1842.

* Dr Taylor writes as if this were newly ascertained. It has for some time been generally admitted by those who have given any attention to the subject, that air heated by contact with iron at a high temperature is desiccated or deprived of moisture by the process, and thus made unsuitable to human necessities. Pipes heated by steam or hot water, since they never can rise above 212 degrees at most, are well calculated to warm the air of apartments, and will be consistent with health, if ventilation be at the same time attended to.

atmosphere is pernicious, and referred to the experience of the calico-printers, and of those who are in the habit of using Arnott's stoves. We subsequently found that bleachers and calico-printers have generally adopted the system of heating by steam, in consequence of the ill effects produced by dry hot air on the health of the operatives.

Regularity and precision are required in all the operations of a cotton mill, and these are enforced by the accurate working of the machinery. Accidents from the machinery are of very rare occurrence; the most dangerous parts of the turning shafts, which almost alone are perilous to the incautious, are either protected by wooden boxes or placed where there is rarely occasion to pass them. The driving-straps are dangerous only to those who voluntarily encounter peril. Were the proprietors to leave the dangerous parts of their machinery so exposed as to produce great liability to accident, they would not only be needlessly cruel, but stupidly blind to their own interests. Any accident would produce a derangement of machinery, the repairing of which would cost infinitely more than the cases or boxes necessary to prevent its occurrence. In one mill, we are told that slight cuts and bruises were frequently occasioned by the tricks which young operatives played upon each other when employed to oil the machinery; but in most of the instances in our inquiry from the operatives respecting the frequency of accidents, they laughingly asked if we thought work-people were such fools as to hurt themselves designedly.

Most modern mills are built fire-proof; those which are not so, have generally a fire-engine of their own, in the use of which the operatives are occasionally exercised. It is now also the favourite plan to have the cotton raised by a crane in its raw state to the upper storey; it then descends from floor to floor, in the successive stages of its manufacture, until, on the ground floor, it is woven into cloth by the power-loom.

The amount of capital invested in a spinning-mill is usually calculated by the number of spindles required, which not unfrequently amount to one hundred thousand. Some years ago the cost of a mill was estimated at L.1 per spindle; but in consequence of the progress of mechanical improvement, the cost is not now rated higher than 13s. 4d. per spindle. The rapidity with which the great engineering houses can stock a mill, with all its engines and machinery, is scarcely credible; they are enabled to do so by having accurate wooden models of all the several parts, from which castings are easily taken, and the framework is thus got ready with the greatest expedition."

Dr Taylor adverts to the book-stalls of Manchester, and, in connexion with one which formerly stood near the entrance into Salford by the bridge, narrates the following curious history:—"Some thirty or forty years ago a young carpenter, in a Welsh county, was drawn for the militia; he had no taste for a soldier's life, with its great dangers and small pay. In addition to the ordinary mysteries of his own trade, he had acquired great skill in turning, was a tolerable wheelwright, and, when no more experienced workman could be had, was found able to mend the machinery of a mill, and even to suggest some mechanical improvements which his neighbours were too obstinate to adopt. After a very brief period of service, he deserted and came to London, where he obtained employment in a lathe manufactory. Here he soon became conspicuous for his mechanical skill, and the ingenuity of his contrivances to diminish labour and perfect the machines he constructed. While he was rapidly advancing in the confidence of his employer and the estimation of his comrades, he happened to meet in the street a sergeant belonging to his former regiment, by whom he was recognised. It was necessary for him to quit London, in order to escape the consequences of his desertion; he sought shelter and employment in several provincial towns, and at length came to Manchester. He had no acquaintances in the town, and was for some time unable to procure work: during this interval of reluctant leisure, his attention was attracted by the sight of some mathematical books on the old stall in Salford; he stopped to look at them, entered into conversation with the proprietor, who was an intelligent humorist, and soon inspired him with an interest in his fortunes.

One morning, as the adventurer went to consult his friend at the book-stall on his chances of obtaining employment, a gentleman came up to purchase some work on practical mechanics. As he turned over the plates, which appeared very complex, he got a little puzzled, and said to himself, in a half-whisper, 'I cannot understand this!' His perplexity and anxiety were so evident, that the young stranger was induced to come to his assistance; he explained the diagrams in such lucid and simple language, that the gentleman was prompted to inquire into his history. The tale was soon told; and the keeper of the book-stall added to it, that since the young man had come to Manchester, he had been very anxious to procure work, and that he had employed the interval in the study of mathematics.

'Do you understand any thing of the management of lathes, young man?' asked the gentleman.

'Yes, sir, for lathe-making was the business in which I was engaged.'

'Well, come to my house to-morrow. I have got down a lathe from one of the first makers in London; but owing to some peculiarities in its construction, I fear that I cannot easily find a person qualified to set it up.'

On the morrow the young man went at the appointed time to the house of his new employer. The lathe was unpacked, and he at once recognised it as one of his own construction. He mentioned the fact to the gentleman, and identified his work by specifying some private marks on the machinery. When his task was accomplished, the young man solicited and obtained leave to try some experiments on turning spindles. He produced some specimens so obviously superior to the spindles then in use, that his patron was induced to advance him a sum sufficient to set him up in the turnery business. The new spindles were soon eagerly sought; their maker at the same time gained opportunities of becoming acquainted with the several processes of a cotton mill, and as he studied them, improvement after improvement was opened to his mind. His fame as a mechanist rapidly increased; men of wealth sought a partnership with the man of talent; capital was supplied to carry out the suggestions of ingenuity; and at the present moment the hero of this history is at the head of an establishment the fame of which extends through both hemispheres. After having heard this history, it was impossible to avoid feeling some regret for the disappearance of the old book-stall in Salford."

THE BRONZE HORSE.

A NEAPOLITAN LEGEND.

It is now some eighty years since there lived, in a vast old palace in one of the narrow streets that run behind the Strada Toledo in Naples, the Principe (Prince) di San Silvestro. A very distant relation of the family to whose honours he had succeeded, he had passed all his younger days in obscurity in one of the provinces with his father, who, proud of his high birth, but without the means of supporting it in the style of his equals, preferred vegetating in solitude with his only son, rather than permit him to endeavour to raise the fortunes of his house again, by entering any profession that might tarnish the dignity of his ancient name.

Shortly after the death of his father, the prince came into his inheritance, which in reality added but little to his wealth, as it consisted merely of the old gloomy Palazzo Cavallo, which was much dilapidated, and totally unfurnished, excepting a few rooms which had been inhabited by the late prince—an eccentric character, who lived so retired, and with so little show, that it was the surprise of every one how he could have squandered a very considerable fortune, when, at his death, all his estates were obliged to be sold for the payment of his debts. The new prince removed to Naples immediately upon the demise of his relation; having lost both his father and his wife in the course of the preceding year, he had now no tie to the country, and was desirous of giving his son the advantage of a superior education to what a retired province could afford him.

They were soon quietly established in their new abode; Constantino was sent to a college; and the prince, who was very little known in Naples, continued to live almost as much secluded as he had done in Calabria. Upon taking possession of the Palazzo Cavallo, he found that the only remains of its ancient magnificence consisted in a very fine colossal statue of a bronze horse, which was placed upon a high pedestal in the centre of the court; and it frequently occurred to him how gladly he would dispose of it if a purchaser would present himself, without his pride being hurt by offering it for sale.

One winter evening, several years after his taking up his residence in Naples, when it was nearly dark, a little old man, bending double apparently from age, and with his hat so much pulled over his face as scarcely to allow any of his features to be visible, entered the court of the palace, and, meeting one of the prince's servants, he inquired if he might speak with his master.

The prince, who was disengaged, desired he might be admitted, and to his surprise the stranger (who, by his accent, seemed a foreigner), apologising for his intrusion, told him that the reason of his visit was to inquire if he had any objection to sell the bronze horse he had seen in the court below, as he wished to become its purchaser. The prince replied, that he was willing to dispose of the statue, provided a good price could be had, but that the very lowest sum he would take was 4000 ducats. This the other declared was far above its value: however, after continuing to discuss the point for some time, he at last offered 3500 ducats, which the prince agreed to accept; and the old man said he would return on the following morning to remove the horse, and bring an order upon a well-known banker for the stipulated sum. He then departed, leaving the prince very much at a loss to guess what could have induced this singular-looking being to make such a purchase; and suspecting that it must be a hoax of some one who was acquainted with his necessities, he scarcely expected to hear any thing more of the matter. However, next evening the old man called at the gate, and sent up by the porter bills for the 3500 ducats, correctly made out upon the before-mentioned banker, along with a note from the unknown, requesting a receipt for them, adding, that he had been prevented bringing workmen to carry away the statue that morning, but that he should certainly return for it on the morrow.

The prince, well pleased to find he was not to meet with a disappointment, hastened to give the desired receipt; but when the porter descended with it to the court, the man was nowhere to be seen, and, after waiting some time in expectation of his reappearing, he went up stairs again to inform his master of the fact. More than ever amazed, the prince could in no way account for such conduct, but the next morning the first thing he did was to go himself to the banker's to find out if the money had been actually placed there. Contrary to his almost extinguished hopes, the bankers replied, that the day before a little man (answering the description the prince gave) had called and paid them 3500 ducats on the prince's account, and had received from them a receipt for the same; the signature he gave seemed some Jewish name, which none of them had ever heard before.

As soon as the prince had received his money, he hurried home, with no small curiosity, to see the mysterious personage again; but no tidings had been heard of him during his absence. The bronze horse remained in solitary grandeur in his place; and from that day forward, the Jew, or whoever he might be, never more made his appearance at the Palazzo Cavallo. So strange was the event, that the prince could not help mentioning it to all his acquaintances, and much inquiry was made in every direction, to endeavour to throw some light upon the affair, but all in vain; and after a time, except by the prince himself, the matter was entirely forgotten.

It might be about five years after the sale of the horse, that the prince was one morning awakened in great haste, at the early hour of six o'clock, by the sudden entrance of the Abbate Selvaggi (an old antiquarian friend of his), while he was yet in bed. "Get up, get up, my friend," said he, "we must go instantly and examine your bronze horse. I have made a great discovery; but I will explain nothing until we have convinced ourselves with our own eyes of the extraordinary truth." The prince ran with the abbate to the statue, when the priest, after a glance, exclaimed, "It is true!—they *have* taken out his eyes!" The abbate then stated to the surprised prince, that he had been just called to the deathbed of the confessor of the prince's late father, and had received from the dying man a most extraordinary confession in writing. After expressing regret for a deed of guilt committed, the dying man's confession narrated, that he had been the confessor of the late Principe di San Silvestro, who, many years ago, had confided to him that he had formed the resolution, on account of a vow he had made, to place two brilliants, of immense size and value, as eyes in the head of his bronze horse. The confessor had aided in the act, and added, that he strongly suspected (although he outwardly appeared to be a strict Catholic) that the reason of the prince's doing so extraordinary a deed proceeded from a remnant of the superstitious veneration for horses, which had secretly been cherished in Naples long after the inhabitants were converted to Christianity. But if such was the case, the prince never confessed it. Years rolled on, and the transaction remained a profound secret; the prince was a strange, eccentric person, considered half crazy by every one, who passed his days and nights in poring over ancient lore, and receiving no visiters, unless it was some one who brought him manuscripts or legends of antiquity, for which he was always ready to give a good price. A short time before his death, the confessor used frequently to meet at his house a little old man of foreign appearance (who, the reader may guess, was the mysterious purchaser of the bronze horse). He had travelled much, and evidently became soon in high favour with the prince, whom he supplied with much of his favourite literature, and they used to be shut up for weeks together over their books. On the death of the prince, the priest was tempted by the stranger with an offer of 10,000 ducats to let the other take away the brilliants and keep the secret. The priest yielded; the strange old man kept his promise, and at once disappeared, leaving his accomplice to deep remorse. This was the confession.

It may be well imagined what was the vexation of the Principe San Silvestro, on receiving the foregoing communication from his friend the abbate. To hear that he had been deprived of wealth, probably more than sufficient to put him upon an equality with the richest of the Neapolitan nobles, would have been a severe trial to any one; but the prince had been so long accustomed to privations, that he no longer felt disappointments so keenly as he did in his younger days: for his son's sake alone he would have desired riches. "God has so ordered it," said he to himself, with a sigh; "I am not born to be fortunate; however, five thousand ducats are better than nothing, and will assist me in fitting out my boy when he leaves college."

In the mean time, the prince's son, the young Constantino Fiorillo, grew up the pride and joy of his fond father, who, by strict economy, had been enabled to give him an excellent education; and gay, handsome, and accomplished, he was beloved by all his companions in college, who, being sons of the first noblesse in Naples, were much superior to him in fortune. But Constantino as yet felt not the difference of their positions. At college all were equal; and when, at the age of eighteen, they returned to their families, several young men with whom he had contracted a warm friendship continually invited him to visit them; and at length the Duca di Laurino, the father of his most favourite young friend (who was carried

off suddenly by an illness of a few days), procured for him the commission his son had held in the *Guardio Corpo*, or King's Body Guard, which was then, as it is now, considered the first regiment in Naples, and only the sons of the nobility were admitted into it.

One evening, during a very gay carnival, the young Conte di Lesino called to carry his friend the Principino with him to a ball at the Duc de St Marguerite's, who was then French ambassador at the court of Naples; and on their way thither, the count exclaimed gaily, "Prepare to surrender your hitherto insensible heart to-night. Constantino, I am going to show you the prettiest girl that has appeared this winter, the beautiful Cecile de Montemar—only do not try to supplant me, as I fully intend doing her the honour of making her Contessa di Lesino. My father has given his consent to the match; she is the only child and heiress of Monsieur de Montemar, a stranger Frenchman, whose wealth, report says, is immense."

The ball had commenced, for it was late when the friends arrived; and the count hurried forward in search of the subject of their conversation, leaving Constantino standing near the door, quietly waiting for the conclusion of the dance. A friend introduced him to a young lady of surpassing beauty. It chanced to be Mademoiselle de Montemar, and the young prince danced with her, to the admiration of all, both being alike perfect in the exercise. But, to Constantino's surprise, M. de Montemar at last hurried up, and, with something like anger and rudeness, placed his daughter in charge of the Conte di Lesino. The ball had no further charms for Constantino, nor did Cecile de Montemar herself appear to relish her change of position. During the continuation of the carnival, Constantino had opportunities of seeing Cecile, and a strong mutual passion sprung up between them; but the young lady informed him of a peculiar personal aversion expressed for him by her father. From this time their intercourse was half a secret one, and carried on through the kind Duchesse de St Marguerite. It had the effect of firmly rivetting the chains of love, in the case of both, though that love was still unacknowledged. Meantime, the Conte di Lesino continued the father's avowed favourite.

The carnival was at length concluded; and after the expiration of a few weeks more, the count determined to bring his fate to a decision, and made a formal offer of his hand to Mademoiselle de Montemar, having hitherto only spoken to her father on the subject, who had always endeavoured to keep up his hopes, simply cautioning him not to be too precipitate in making his declaration; but the impetuous Neapolitan would wait no longer, and urged his suit with much eagerness, but at the same time with the air of one assured of success. What was his surprise, then, when Cecile firmly declined his proposals, adding, that she knew his addresses were encouraged by her father's sanction, and she feared her refusal would displease him if he knew it. "But why," continued she, "need he be acquainted with it? Be generous, Monsieur le Conte, and let what has passed be buried in oblivion. I do not love you, therefore I cannot become your wife; but I shall be the most grateful of your friends, if you will grant my request, and conceal from my dear father that you have ever spoken to me on this subject."

The eyes of the Italian flashed fire as she concluded, and his countenance lowered; but Cecile had turned her face from him while she spoke, afraid to witness the reception of her refusal. With a strong effort, the count repressed the passionate language that rose to his lips; and merely replying, "You shall be obeyed, Mademoiselle," he bowed profoundly and left the room. Cecile, in the innocence of her heart, was overjoyed that he had received her answer with so much calmness, and delighted to think that the affair was settled, and, as she hoped, without offending her father; she flew to her friend the duchess, and with a radiant smile communicated the above particulars, adding, "How very happy I am that I shall never more be annoyed by his attentions!" "And you think that the count will be satisfied to give you up so easily?" asked the duchess; "do not flatter yourself he will; however, I am glad that you have answered him so decidedly, and we shall hope the best. But let us think no more of your rejected swain for the present—you must come with me and choose a dress for a grand masked call, which is to be given by the Marchese Severino on the marriage of his son. It is expected to exceed all the carnival fêtes in splendour and I intend that my dear Cecile shall be its brightest ornament."

Cecile, however, begged to be allowed to go to the ball as a simple peasant of Provence, and the duchess consented, taking herself also a French character, that of the Duchesse de la Valliere. It was on this occasion that the young Constantino found a chance of openly avowing his love for Cecile. His kind friend, the Duchesse de St Marguerite, gave him a hint of the masked characters chosen by herself and Cecile, and he went to the same ball as a Provençal troubadour, to have an opportunity of lingering appropriately by his fair countrywoman's side. The issue of the prince's avowal of his passion was to him deeply mortifying. Cecile was affected even to tears; but his declaration only seemed to recall her to a remembrance of her father's aversion and her forgotten duties. She bade Constantino think of her no more and left the ball, overpowered by conflicting feelings. The principino soon followed.

On that same night his father died suddenly. The grief of the young prince was violent and deep. Having had but one parent from his early infancy, all the warm and enthusiastic feelings of his heart had been concentrated in his love for his father, and, until he met with Cecile de Montemar, no other attachment had found a place there. He therefore sunk almost into despair on finding himself alone, as it seemed, in the world, without any natural connexion on whom he could rely; and the affairs of his late father were left in such disorder, that there was scarcely a sum at his command sufficient to keep him above actual want. The latter misfortune weighed but little upon him in the present state of his mind; it only made him withdraw himself still more from the world. He could not bear to tax the generosity of the Duc de St Marguerite and many kind friends who would have offered him assistance, and he often seriously contemplated shutting himself up in a monastery for life. For a year after the death of his father, he remained almost entirely confined to his own palace; and his gay companions, finding they were constantly denied admittance to him, by degrees gave up the attempt; so that the prince, who had so lately been the life of all their parties, soon faded from their memories, as if he had never existed. The only recreation in which he indulged, was in taking long solitary rambles in the environs of Naples, and one of his most favourite resorts was to the lovely little Lago d'Agnano; he would linger for hours by the most retired side of it, carrying a fowling-piece in his hand, but rarely making use of it. Reclined upon the grass, his thoughts would wander back to the happy days he had spent on his first entrance into life, and of the bright sunbeam that had crossed his path, in the vision of his Cecile; and often the shades of evening had long fallen ere he sought again his solitary home. One night he had taken a longer ramble than usual, having sauntered for several hours in the romantic woods of Actroné, the king's preserve, the ascent to which is by a winding road from one extremity of the lake, and the sun had set some time before he reached the broad path, skirted by trees, which runs along the left side of the water. He had advanced in it but a little way, when he overtook a lady and gentleman; the latter, seemingly an invalid, and very feeble, was leaning heavily on the arm of his companion, and Constantino started as he once more heard the voice of Mademoiselle de Montemar, who said anxiously, "Dear papa, I fear you have walked too far; you are fatigued; you will never reach the carriage. Henri," she added, to the servant who attended them, "go on and bring it back to us, and we shall await you here."

Constantino withdrew behind the trees, that he might escape observation, while Cecile seated her father upon the grass, and placed herself beside him. The servant had not left them above a few minutes, when suddenly two men, who had been concealed behind a bank on the other side of the road, sprung out upon them; one of them seized the old De Montemar, and, gagging his mouth to prevent him calling out, he was proceeding to tie his hands, when a shot from the gun of Constantino laid him prostrate on the earth. The other man, meanwhile, had caught up the fainting Cecile in his arms, and proceeded to carry her off with great rapidity across a field towards a hut at some distance; but the moment Constantino saw his shot had taken effect, he flew to the rescue of his beloved, loudly calling upon the ravisher at his peril to stop and release the lady. The former turned, and seeing the prince was unarmed, he laid the insensible Cecile on the ground, and, drawing his sword, rushed at once upon him; but Constantino was prepared, and pulling out a stiletto he always carried about with him, he struck it with all his force into his assailant's right arm, the pain of which obliged the latter to drop his sword and stagger back, when Constantino instantly possessed himself of it. The Conte di Lesino (for it was he) seeing the victory lost, fled with the greatest precipitation, and was soon out of sight. The prince cared not to follow him; all his anxiety was for Cecile, who had now begun to revive. He durst not leave her to call for help, but, to his inexpressible relief, he saw De Montemar's servant running towards them, with whose assistance he conveyed Mademoiselle de Montemar to the place where they had left her father. She had now recovered her consciousness, but was nearly relapsing again on finding that the dreadful shock had been too much for the enfeebled frame of her parent, who was so exhausted that he could scarcely make any answer to their inquiries. The carriage having now arrived, Constantino, at the earnest entreaty of Cecile, accepted a seat in it to Naples. Little conversation passed during the drive: Cecile's looks, more than words, spoke her gratitude, but her father engrossed all her attention; his faintness increasing so much that they were often obliged to stop, fearing he would expire ere they could reach home with him. On arriving at length at De Montemar's palace in the Chiaja, Constantino only remained till he saw the invalid carried to his room; he then dispatched a servant in all haste for a physician, and sent another to inform the Duc and Duchesse de St Marguerite of the catastrophe; then pressing the hand of the weeping Cecile, he took his leave, saying he should return early the next morning to inquire for them both. It may be imagined that, after the agitating scenes he had been engaged in, sleep did not visit his eyes, and the earliest dawn of day found him again at De Montemar's door. The report the servants gave of the latter was very unfavourable; he continued to sink, and the physician declared it his opinion that he could not survive another day. While they were conversing together, Mademoiselle de Montemar's maid entered with a note, which she said she had that moment been desired by her mistress to send to the Principe San Silvestro. Constantino tore it open, and read these words—"My dearest father earnestly desires to see you; lose no time, I beseech you, in coming to us." He instantly followed the maid to the sick man's chamber, at the door of which he was met by Cecile, who led him up to the bedside of the dying De Montemar. The old man, feebly turning his eyes towards him, stretched out his hand, saying, "You have saved my child from worse than death, Monsieur, and there is but one reward worthy of you; I rejoice that my life has been spared long enough to do you justice. Take her," continued he, uniting his hand with that of Cecile, "and may the blessing of an unfortunate and repentant man rest with you both!" Then, turning to the Duchesse de St Marguerite, he added, "Retire, my dear friend, and take Cecile with you for a short time—I have some private instructions I wish to give to the prince, as my son, which it would only pain my darling child to hear." The ladies accordingly withdrew, when De Montemar, addressing Constantino, said, "Will you swear solemnly that you never will make known to my beloved Cecile what I am going to reveal to you? It would only increase all my other sufferings in these my last moments, the idea that she would despise her poor father's memory, and I humbly trust that my present repentance may in some degree wipe away my sins. May I depend upon your secrecy?" Constantino eagerly gave the desired promise, and De Montemar continued thus—"In me, prince, you behold the purchaser of your father's bronze horse. I know you are acquainted with all the circumstances of the transaction, from the confession of the old priest who was my accomplice in the guilty deed, so I need not repeat them to you; but open that cabinet, and touch a spring you will see at the back of it, that I may give you proofs of my identity." Constantino obeyed, and on opening the secret drawer, he beheld to his amazement the two small frames which had contained the diamond eyes he had heard so much of, with the original eyes which had been taken out to make room for them. "Can you forgive me," said the expiring man, "for thus having robbed your good father of his riches, and deprived you for so long a time of your just rights? Could I but give you an idea of the misery my guilty conscience has occasioned me for many years, you could not refuse me your compassion. My health has by degrees sunk under it, and it scarcely required the shock of the last night to snap the slender cord asunder. When I met you last winter, my unhappiness was redoubled—I seemed to read in your eyes that you were informed of my guilt; and when I perceived your attachment to my daughter, I was haunted by the fear that you might disclose the secret to her—for which cause, more than your want of fortune, I forbade her having any intercourse with you. My full intention was, as soon as I should unite her to the Conte di Lesino, and thus secure for her the illustrious station in society I was ambitious of, to confess all to you, restore your property, and then seclude myself in a monastery for life. Cecile's firm refusal to accept the count's proposals disconcerted my plans; and at her earnest entreaty, I at last consented to give him a formal dismissal, the consequence of which has been his rash attempt of last night." De Montemar here paused to recover his breath, and Constantino hastened to assure him, that in the father of his beloved Cecile all was forgiven, adding, that his only desire was to gratify him in any remaining wish he might have.

"Bless you, my dear son," said De Montemar, his eyes overflowing with tears, "I am undeserving of such goodness; but I have one last request to make, which, if not very repugnant to your feelings, I trust you will comply with. All my estates are in France, to which country my daughter is most fondly attached; to Naples you have no tie, no friends, no property, to interest you—will you then become a Frenchman, take my name, and make your home in Provence? If you can agree to this, you will make me die happy; for—it may be a weakness—but I feel that if you remain in Naples, one day or other, by some chance, the degrading tale of my unworthy conduct may reach the ears of poor Cecile, and with her sensitive feelings, I am convinced she could not survive the knowledge" ——

The old man's voice here became inarticulate, and he shortly after expired in the arms of his daughter. Constantino determined to respect De Montemar's dying request; and shortly after his union with Cecile, they bade adieu to Naples, and sailed for France, where they established themselves. Constantino faithfully kept his promise, and his wife never suspected the fatal secret. The bronze horse still remains in the court of the Palazzo Cavallo, where it may be seen by all curious inquirers. The legend respecting it is probably now almost forgotten, or treated as a fable, unless by those who are so fond of the marvellous as to give eager credence to all such ancient records.

"THE TOURIST OF THE WOODS."

The transplanting of a large number of the Celtic population of the Highlands to Canada, has had the effect of introducing Gaelic as a vernacular tongue into North America, and of perpetuating in that distant land many traditions respecting the home country, which are perhaps already lost in Scotland. This localisation of Celts, still using their original and ancient language in the woods of America, is, we think, an exceedingly interesting fact in the progress of races. That this tongue will at no distant day disappear and be superseded in America, as it has been at home, by the more serviceable language of England there cannot be the smallest doubt; in the meanwhile however it is gratifying to know that our Celtic brethren across the Atlantic are not by any means shut out from the blessings of literature because they cannot read our common English. They have Bibles in Gaelic: clergymen preach to them in Gaelic; and during the last year they have had a Gaelic newspaper—*Cuairtear nan Coillte*, or "The Tourist of the Woods." This paper, which is published weekly at Kingston, and has, appropriately enough, for its motto, *Clann nan Gaidhail an gualibh a cheile*—"Highlanders shoulder to shoulder," is designed to circulate useful information among the Scoto-Celtic immigrants on the subjects of labour, agriculture, improvement of lands, the best fields of industry, means of transport from place to place, &c., together with a

large share of matter of mere amusement, chiefly relative to the old country. We observe, from a number before us, that in future a portion of the paper is to consist of English translations of the principal articles in Gaelic, for the benefit of those immigrants who do not understand the Gaelic tongue.

While expressing our best wishes for the success of this creditable effort to improve the condition of emigrants from the Scottish Highlands, we cannot imagine that any means could be more advantageously employed for keeping alive the warmest feelings of patriotism towards the mother country in our North American possessions.

POPULAR ENGLISH FESTIVALS.

ST VALENTINE'S DAY.

ST VALENTINE'S DAY is the 14th of February. It is now almost every where, we suspect, a degenerated festival, the only observance of any note consisting merely of the sending of jocular anonymous letters to parties whom one wishes to *quiz*, and this confined very much to the humbler classes. The approach of the day is now heralded by the appearance in the printsellers' shop windows of vast numbers of missives calculated for use on this occasion, each generally consisting of a single sheet of post paper, on the first page of which is seen some ridiculous coloured caricature of the male or female figure, with a few burlesque verses below. More rarely, the print is of a sentimental kind, such as a view of Hymen's altar, with a pair undergoing an initiation into wedded happiness before it, while Cupid flutters above, and hearts transfixed with his darts decorate the corners. Maid-servants and young fellows interchange such epistles with each other on the 14th of February, no doubt conceiving that the joke is amazingly good; and, generally, the newspapers do not fail to record that the London postmen delivered so many hundred thousand more letters on that day than they do in general. Such is nearly the whole extent of the observances now peculiar to St Valentine's Day.

At no remote period it was very different. Ridiculous letters were unknown; and, if letters of any kind were sent, they contained only a courteous profession of attachment from some young man to some young maiden, honeyed with a few compliments to her various perfections, and expressive of a hope that his love might meet with return. But the true proper ceremony of St Valentine's Day was the drawing of a kind of lottery, followed by ceremonies not much unlike what is generally called the game of forfeits. Misson, a learned traveller, of the early part of the last century, gives apparently a correct account of the principal ceremonial of the day. "On the eve of St Valentine's Day," he says, "the young folks in England and Scotland, by a very ancient custom, celebrate a little festival. An equal number of maids and bachelors get together; each writes their true or some feigned name upon separate billets, which they roll up, and draw by way of lots, the maids taking the men's billets, and the men the maids'; so that each of the young men lights upon a girl that he calls his *valentine*, and each of the girls upon a young man whom she calls hers. By this means each has two valentines; but the man sticks faster to the valentine that is fallen to him than to the valentine to whom he is fallen. Fortune having thus divided the company into so many couples, the valentines give balls and treats to their mistresses, wear their billets several days upon their bosoms or sleeves, and this little sport often ends in love."

A more recent writer states how the ceremony was conducted, not many years ago, in a rural situation in the south of Scotland. This person, with a friend, had wandered from his road on the evening of the 14th of February, and at last was obliged to apply for the hospitality of the inhabitant of a modest mansion which chance threw in his way. "The good man heard our story, welcomed us to a seat beside a blazing fire of wood and turf, and appeared delighted with our coming. We found ourselves in the house of rendezvous for the lads and lasses of a neighbouring village to celebrate St. Valentine's Eve. Our entrance had damped the pleasantry, and inquisitive eyes were directed towards us; it was our business to become familiar with our new acquaintances, and the pastimes were renewed. Our sudden appearance had disturbed the progress of the village schoolmaster, who had finished writing on small slips of paper the names of each of the blooming lasses of the village. Each lad had dictated the name of her he loved. These precious slips of paper were now put into a bag and well mixed together, and each youth drew out a ticket, with hope that it might, and fear lest it should not, be the name of his sweetheart. This was repeated three times; the third time was the conclusion of this part of the sport. Some drew beloved names the third time with rapturous joy, others drew names of certain respectable widows and old ladies of the village, introduced by the art of the schoolmaster, and the victims mourned their unpitied, derided sufferings. After the lasses, the names of the young men were written and drawn by the girls in the same manner, and a threefold success was secretly hailed as a suretiship of bearing the name of the fortunate youth. The drawing of this lottery was succeeded by the essence of the amusement, for the valentines were to be 'relieved.' The relieving of the valentine was a scene of high amusement. Each young man had a right to kiss the girl whose name he drew, and at the same time deliver to her the slip of paper; the mirth of this ceremony was excessive. Those who were drawn, and not present, were to be relieved with a gift of inconsiderable value, as a token of regard."*

In that curious record of domestic life in England in the reign of Charles II., Pepys's Diary, we find some notable illustrations of this old custom of relieving valentines. It appears that married and single were then alike liable to be chosen as a valentine, and that a present was regularly given to the choosing party. Mr Pepys enters in his diary, that on Valentine's Day, 1667, "This morning came up to my wife's bedside (I being up dressing myself) little Will Mercer to her valentine, and brought her name written upon blue paper in gold letters, done by himself, very pretty; and we were both well pleased with it. But I am also this year my wife's valentine, and it will cost me L.5; but that I must have laid out if we had not been valentines." Two days after, he adds —"I find that Mrs Pierce's little girl is my valentine, she having drawn me; which I was not sorry for, it easing me of something more that I must have given to others. But here I do first observe the fashion of drawing of mottoes as well as names, so that Pierce, who drew my wife, did draw also a motto, and this girl drew another for me. What mine was, I forget; but my wife's was 'Most courteous and most fair,' which, as it may be used, or an anagram upon each name, might be very pretty." Noticing, soon afterwards, the jewels of the celebrated Miss Stuart, who became Duchess of Richmond, he says—"The Duke of York, being once her valentine, did give her a jewel of about L.800; and my Lord Mandeville, her valentine this year, a ring of about L.300." These presents were undoubtedly given in order to *relieve* the obligation under which the being drawn as valentines had placed the donors. In February 1668, Pepys notes as follows—"This evening my wife did with great pleasure show me her stock of jewels, increased by the ring she hath made lately, as my valentine's gift this year, a Turkey-stone set with diamonds. With this, and what she had, she reckons that she hath above one hundred and fifty pounds' worth of jewels of one kind or other; and I am glad of it, for it is fit the wretch should have something to content herself with." The reader will understand wretch to be used as a term of endearment.

Notwithstanding the practice of *relieving*, there seems to have been a disposition to believe that the person drawn as a valentine had some considerable likelihood of becoming the associate of the party in wedlock. At least, we may suppose that this idea would be gladly and easily arrived at, where the party so drawn was at all eligible from other considerations. There was, it appears, a prevalent notion amongst the common people, that this was the day on which the birds selected their mates. They seem to have imagined that an influence was inherent in the day, which rendered in some degree binding the lot or chance by which any youth or maid was now led to fix his attention on a person of the opposite sex. It was supposed, for instance, that the first unmarried person of the other sex whom one met on St. Valentine's morning in walking abroad, was a destined wife or a destined husband. Thus Gay makes a rural dame remark—

> "Last Valentine, the day when birds of kind
> Their paramours with mutual chirpings find,
> I early rose just at the break of day,
> Before the sun had chased the stars away:
> A-field I went, amid the morning dew,
> To milk my kine (for so should housewives do);
> Thee first I spied—and the first swain we see,
> In spite of Fortune, shall our true-love be."

A forward miss in the *Connoisseur*, a series of essays published in 1754-6, thus adverts to other notions with respect to the day:—"Last Friday was Valentine's Day, and the night before, I got five bay-leaves, and pinned four of them to the four corners of my pillow, and the fifth to the middle; and then, if I dreamt of my sweetheart, Betty said we should be married before the year was out. But to make it more sure, I boiled an egg hard, and took out the yolk, and filled it with salt; and when I went to bed, ate it, shell and all, without speaking or drinking after it. We also wrote our lovers' names upon bits of paper and rolled them up in clay, and put them into water, and the first that rose up was to be our valentine. Would you think it?—Mr. Blossom was my man. I lay a-bed and shut my eyes all the morning, till he came to our house; for I would not have seen another man before him for all the world."

* Hone's Year Book, p. 200.

St Valentine's Day is alluded to by Shakspeare and by Chaucer, and also by the poet Lydgate (who died in 1440), who thus writes—

> "Seynte Valentine. Of custome yeere by yeere
> Men have an usaunce, in this regioun,
> To loke and serche Cupides kalendere,
> And chose theyr choyse, by grete affeccioun;
> Such as ben *move* with Cupides mocioun,
> Takyng theyre choyse as theyr sort doth falle:
> But I love oon whiche excellith all."

One of the earliest known writers of valentines, or poetical amorous addresses for this day, was Charles Duke of Orleans, who was taken at the battle of Agincourt. Drayton, a poet of Shakspeare's time, full of great but almost unknown beauties, wrote thus charmingly

TO HIS VALENTINE.

> "Muse, bid the morn awake,
> Sad winter now declines,
> Each bird doth choose a mate,
> This day's St Valentine's;
> For that good bishop's sake
> Get up, and let us see,
> What beauty it shall be
> That fortune us assigns.
>
> But lo! in happy hour,
> The place wherein she lies,
> In yonder climbing tower
> Gilt by the glittering rise;
> Oh, Jove! that in a shower,
> As once that thunderer did,
> When he in drops lay hid,
> That I could her surprise!
>
> Her canopy I'll draw,
> With spangled plumes bedight,
> No mortal ever saw
> So ravishing a sight;
> That it the gods might awe,
> And powerfully transpierce
> The globy universe,
> Out-shooting every light.
>
> My lips I'll softly lay
> Upon her heavenly cheek,
> Dyed like the dawning day,
> As polish'd ivory sleek:
> And in her ear I'll say,
> 'Oh thou bright morning-star,
> 'Tis I that come so far,
> My valentine to seek.
>
> Each little bird, this tide,
> Doth choose her loved peer,
> Which constantly abide
> In wedlock all the year,
> As nature is their guide:
> So may we two be true
> This year, nor change for new,
> As turtles coupled were.
>
> Let's laugh at them that choose
> Their valentines by lot;
> To wear their names that use,
> Whom idly they have got.
> Such poor choice we refuse,
> Saint Valentine befriend;
> We thus this morn may spend,
> Else, Muse, awake her not.'"

Donne, another poet of the same age, remarkable for rich though scattered beauties, writes an epithalamium on the marriage of the Princess Elizabeth to Frederick Count Palatine of the Rhine—the marriage which gave the present royal family to the throne—and which took place on St Valentine's Day, 1614. The opening is fine—

> "Hail, Bishop Valentine! whose day this is;
> All the air is thy diocese,
> And all the chirping choristers
> And other birds are thy parishioners:
> Thou marryest every year
> The lyric lark and the grave whispering dove;
> The sparrow that neglects his life for love,
> The household bird with the red stomacher;
> Thou mak'st the blackbird speed as soon
> As doth the goldfinch or the halcyon—
> This day, more cheerfully than ever shine,
> This day which might inflame thyself, old Valentine!"

The origin of these peculiar observances of St Valentine's Day is a subject of some obscurity. The saint himself, who was a priest of Rome, martyred in the third century, seems to have had nothing to do with the matter, beyond the accident of his day being used for the purpose. Mr Douce, in his Illustrations of Shakspeare, says—"It was the practice in ancient Rome, during a great part of the month of February, to celebrate the Lupercalia, which were feasts in honour of Pan and Juno, whence the latter deity was named Februata, Februalis, and Februlla. On this occasion, amidst a variety of ceremonies, the names of young women were put into a box, from which they were drawn by the men as chance directed. The pastors of the early Christian church, who, by every possible means, endeavoured to eradicate the vestiges of pagan superstitions, and chiefly by some commutations of their forms, substituted, in the present instance, the names of particular saints instead of those of the women; and as the festival of the Lupercalia had commenced about the middle of February, they appear to have chosen St Valentine's Day for celebrating the new feast, because it occurred nearly at the same time. This is, in part, the opinion of a learned and rational compiler of the 'Lives of the Saints,' the Rev. Alban Butler. It should seem, however, that it was utterly impossible to extirpate altogether any ceremony to which the common people had been much accustomed—a fact which it were easy to prove in tracing the origin of various other popular superstitions. And, accordingly, the outline of the ancient ceremonies was preserved, but modified by some adaptation to the Christian system. It is reasonable to suppose, that the above practice of

choosing mates would gradually become reciprocal in the sexes, and that all persons so chosen would be called Valentines, from the day on which the ceremony took place."

A FEW WEEKS ON THE CONTINENT.

BASLE TO BADEN-EN-SUISSE.

We took leave of the reader just after having entered Basle,* to the close neighbourhood of which we had been rapidly transferred by the railway train from Strasburg. We were then, at last, in Switzerland—we had reached the land of hills, and Alpine glaciers, and picturesque valleys, after a long though not uninteresting journey from the banks of the Scheldt; and the proper business of our excursion may be said now to have commenced.

The time of our entrance to the ancient city of Basle was a beautiful Sunday afternoon, and well calculated to show us a feature in the manners of the place. All the shops, except those in which fruit, tobacco, or other trifles were sold, were closed, and the streets, composed of tall stone houses, many of which possessed well-stanchioned windows, wore an air of tranquil decorum. Yet there was not that austerity which I had been taught to expect in the habits of the people. At a number of the doors sat groups of two or three females, in their best attire, enjoying the calm and rather sultry evening; fountains of pure water gushed forth in heavy jets, giving an air of liveliness to the thoroughfares; and hundreds of men and women were crowding homewards from festivities beyond the barriers. The government, it appears, is rigorous in enforcing Sabbath observance; but as France, with its merry piping village of St Louis, is within two miles of the gates of the town, and Baden lies at a short distance on the other side of the river, the law, as it may be supposed, is somewhat limited in its operation.

One of the first places to which we wandered in the course of the evening was the bridge across the Rhine, where a front view of the town, sloping down the steep bank to the river, gives a good idea of the place. The appearance of the Rhine is startling. It comes rolling from the upper country, a beautiful light green flood, of about a hundred yards in breadth, and in passing presses close upon the foundations of the houses on the lower part of the sloping hill on the left, and by a bend is speedily lost in the flat country on the right. Many of the houses being painted white, with green jalousies, and the upper parts of the town being decorated with spires, or jagged with peculiar-shaped edifices, the scene is both lively and impressive. Immediately below the bridge, at a slip of quay, rests the small steamer which conveys passengers to and from Strasburg, on certain days of the week; but beyond this it does not go, in consequence of the impetuosity of the stream. The bridge, stretching boldly across the river, is constructed chiefly of wood, supported on stone piers, and seems placed in a perilous situation; yet it is of great antiquity, and has withstood numberless shocks during the floods of spring, when the snow-clad peaks begin to send down their annual tribute of waters. At the further end of the bridge, is a small town called Little Basle, where we observed much less appearance of decorum than in its larger prototype; estaminets were crowded with smokers, and outside a coffee-room, on the brink of the river, there were spread a number of small tables, at which persons were enjoying themselves, in a free and easy way, with cigars and the light wines of the country.

Not at all disposed to prolong our investigations on the present occasion, we quietly took refuge at our hotel, and made Basle the subject of more minute examination on the morrow, when the town had resumed its every-day appearance. In the course of our rambles, and in whichever direction we penetrated, it was gratifying to observe an air of great substantiality and wealth; another distinction is appreciated, in comparison with French towns—we see few soldiers, and these of a respectable appearance, and there is on all sides a more wholesome atmosphere of trade and industry. The principal manufacture in the town is that of ribbons, which are as beautiful as those of France, and are exported on a large scale. The town has long been reputed as one of the richest places in Europe for its size (about 22,000 inhabitants), and it continues to be the residence of a set of cautious money-lenders, who exert an influence even over the distant exchanges of Amsterdam and Paris. A number of them, also, are understood to have lent capital to establish and support factories in Mulhausen and Alsace (the adjacent part of France), where the fabrication of tissues of various kinds is at present conducted on a scale resembling that of any English manufacturing district. The ribbon manufacture was considerably benefited by the settlement of weavers from France in the year 1685, when, by the revocation of the edict of Nantes, Louis XIV. drove great numbers of Protestants into other countries for protection. At present, nearly 12,000 individuals are believed to be engaged in this trade in Basle and its neighbourhood. The business is conducted on an enterprising but not rash scale; bankruptcies are of rare occurrence; and the workmen are generally in comfortable circumstances. A considerable number of them are proprietors of the cottages in which they reside, and for the last thirty years they have supported a Savings' Bank, which is rich in accumulated earnings. The government of the canton, with judicious consideration, takes care that no citizen shall grow up in a state of ignorance dangerous to the community—parents are compelled, on pain of imprisonment, to send their children to school until their tenth or twelfth year; and for those who cannot afford to pay, the education is gratis. Besides the higher academies, there are several schools at which special instruction is given in drawing, ornamental design, &c., in order to improve the tastes and habits of the operative classes.

Murray, I don't know with what truth, tells us that, when somewhat more ardently religious than at present, the piety and mercantile spirit of the tradesmen of Basle were remarkably exhibited in the mottoes and signs placed over their doors; one of these blazons, over the threshold of a butcher, is recorded to have had the following appendage of elegant versification:—

> "Wacht auf ihr Menschen und thut Buss;
> Ich heiss *zum Goldenen Rinderfuss*."

Which may be translated—

> "Wake, and repent your sins with grief;
> I'm call'd the Golden Shin of Beef."

We did not see any thing of this sort, but observed a tolerably well-filled flesh-market, considering it was Monday morning, and the bakers' shops already steamed with shelves of substantial loaves, the price of which, as we observed by tickets outside, was regulated by a magisterial tariff. All tourists speak admiringly of the fountains of Basle. They are, indeed, pretty and refreshing; and one wonders where all the water comes from. Yet, after all, these fountains are a barbarous mode of supplying a town with water; and it would be infinitely more to the purpose to introduce pipes and cisterns into every dwelling-house. A peculiarity is here for the first time observed in the construction of the houses, which continues through all Switzerland, and is a natural consequence of surrounding towns with walls. I allude to the practice of devoting the lower floors as stables, and, to make the matter worse, causing the entrance to these receptacles to be under the roof of the same small covered court into which certain windows of the dwelling-house above are opened. We had an opportunity of enjoying this very agreeable proximity to the cavalry of the establishment in the Drei Könige; and in almost every house we slept in for the succeeding four weeks, we were equally fortunate. As in Edinburgh, where the vicious fashion of building tall houses has been perpetuated long after the necessity for huddling up the population within a given space had passed away, so, in the Swiss towns, the fashion of making stables in the lower storeys, even of the finest residences, is much too inveterate to be easily swept away. With this peculiarity as a drawback, we perceived sundry instances of improvement in architecture, and had occasion to admire an elegant suite of buildings, recently erected in the higher and more open part of the town, for the university.

Basle is a very small state, consisting, in fact, of little else than the town. Anciently, the city, with its adjacent territory, formed a part of the German empire; but in 1501 it was admitted into the Swiss confederation, from which time till 1798, when the French altered the face of affairs, it was a republic managed by an aristocracy of citizens. On the 20th of January 1798, the burgomaster and grand council thought fit to enact, that all citizens in town and country should possess equal privileges; and all, accordingly, benefited by this decree till 1814, when its provisions were reversed, and the aristocracy of the town resumed their former superiority, leaving the country without an adequate representation. Now commenced a regular storm of politics, country *versus* town, which lasted till 1830, when the second French Revolution giving encouragement to the party who had been thrust out of power, the quarrel was referred to the argument of sword and bullet. It was a most distressing thing to see this ancient republic, of about twelve square miles and 40,000 inhabitants, breaking into civil war; but all the remonstrances of the diet failed to bring about an amicable settlement. The town made some concessions, but the day was gone by for half measures; and, after a world of wrangling, in August 1833, the town forces, amounting to several thousand men, with 12 pieces of artillery, marched against those of the country. The movement was badly conducted; the *campagnards* or countrymen defeated them by a sudden onslaught; and the Basleois, completely routed, left 100 men dead on the field. The diet now took energetic measures to settle the disturbances, and ordained a separation into two cantons, called Basle Ville and Basle Campagne, the latter consisting of two-thirds of the original canton. Each sends a deputy to the diet; but the two make only one vote when they agree, and if they differ, the vote is not to be reckoned. By this arrangement, the town of Basle retains its constitution; having first, in order to secure it, lost a hundred citizens, and entailed upon itself that invariable attendant on wars—a public debt.

After seeing all that we thought worth looking at in the town, we gladly left its confined streets, and set off on our excursion in the voiture of a *lohnkutscher*. A lohnkutscher is one who owns a carriage and a pair of horses, which he lets out for hire, occasionally himself acting as driver. Around every inn you see a crowd of such persons; and I rather believe the hotel-keepers give them and their horses free quarters, as a premium for bringing customers. The lohnkutscher is a civil fellow, generally speaks French, has no particular dress, and is on the whole not extortionate. His regular fare is twenty francs per day, provided you bring him back to where you started; but as this is seldom the case, he practically receives thirty francs per day, ten francs being counted for back fare. If he behave well, which he is almost certain to do, you give him a gratuity of two or three francs over and above his stipulated charge. He will accommodate himself to all the whims of the voyageur—start at any hour, stop where he wishes to come out and walk, and will take him in a leisurely way from thirty to forty miles in the day, including a stoppage of an hour somewhere for dinner. We were fortunate in picking up a singularly good-humoured person to take us in charge, Louis by name; and, being a native of Vaud, French was his vernacular tongue. Louis was a highly respectable man, dressed, when on duty, like a substantial yeoman, in a round hat and olive-coloured greatcoat, and only shifting into a blue linen blouse when engaged in the business of the stable. With respect to manners, he was an agreeable mixture of German steadiness with French acuteness and civility. Whenever we came within sight of any scene of historical interest or picturesque beauty, Louis's laughing round face was turned round to the carriage, and, with whip outstretched to the spot, he obligingly opened his store of knowledge on the subject.

Under the auspices, then, of this useful conductor, behold us sallying from the garrisoned portal of Basle, on our way to Zurich, which lies at the distance of fifty-three English miles, in a south-easterly direction. Excellent as were Louis's horses, it would have been impossible to proceed that length in a single day, even had it been desirable; and our minds were at any rate made up to take the journey quite leisurely, visiting, as we went along, the highly interesting union of the three great tributaries of the Rhine—the Aar, the Reuss, and the Limmat; and stopping for the night at the comparatively little-known watering-place of Baden in Argau, or, as it is called by the French, Baden-en-Suisse.

Our route lay for several miles over an undulating piece of country, with the Rhine on our left, and uplands and hills of various heights on our right. The view of the light-green river, occasionally procured through openings in the bushes and sloping banks, with the open country of Baden beyond, backed by the hilly range of the Black Forest, was very pleasing; but not more so than rich green hill-sides and vales on our right, all evidently devoted to some useful purpose in husbandry, and here and there dotted with masses of trees. We now began to see cottages and farm-houses standing alone, both by the roadside and at a distance. It was also apparent that there was nothing here like those large seignorial tenures which are common in Baden. The country was partitioned into fields, under tolerable culture, for grain crops; and many parts were thickly studded with vineyards, that looked more promising than what I had seen farther down the Rhine. The farms, I was told, seldom exceeded forty acres, and they were generally not more than half of that size: being, for the greater part, the property of those who cultivated them, we had now an opportunity of seeing in actual practice that division of property which has been often described as the perfection of the social condition. I shall not generalise at present on this much-debated question, and content myself with saying, that, in the course of the day's journey, a new light broke in upon our ideas of Swiss romance. The cottages of the peasantry, I regret to say, were any thing but cleanly or decent in external aspect, and sundry villages we passed through would have vied, in point of dirtiness, with the dirtiest village in Scotland. At one of the largest of these villages or small towns, called Frick, we were brought to a halt to dinner about one o'clock; the sun glaring with intolerable splendour, and the heat excessive. Not a soul was astir on the burning street, as we descended at the door of what we found to be a good and well-provided inn. Nothing was to be seen alive but a few stray hens scratching on the numerous dunghills, or ducks paddling in the green stagnant pools with which every habitation was provided. With a temperature at nearly 100 degrees Fahrenheit in the sun, I leave any one to judge if this could be called a wholesome state of affairs.

The continuation of our ride was through a country which improved in interest as we advanced; and being now in the Roman Catholic canton of Argau or Argovie, churchyards full of glittering crosses, and figures by the roadside, were occasionally passed. Having wound our way up a long ascent between two woody hills, a splendid view burst upon us at the summit of the vale of the beautiful winding Aar. In the extreme distance on the east, high ranges of hills formed a background to the scene; farther in front, on the top of a craggy height, stood the castle of Hapsburg, the cradle of the imperial family of Austria, now a few jagged ruins; beneath, and still nearer us, was the Aar, pursuing a serpentine course amidst richly-clothed banks; and, descending the long sloping path, we saw it pass onward to the town of Brugg, beyond which it vanished round a corner of a vine-clad steep. Brugg, to which we were soon brought, lies in a hollow on both sides of the river,

* The proper pronunciation of this word is *Basil*, though the French pronunciation, *Baal*, is also common

and is neat and substantial in appearance. Here we crossed the Aar; and, at the distance of little more than a mile beyond the town, came upon the equally if not more beautiful vale of the Reuss; then, crossing this stream also, at a short distance beyond, having gained another rising ground, we had before us the river Limmat, rolling onward through a similarly beautiful vale. The spectacle was striking, and telling Louis to give the horses a rest, we descended to examine it at our leisure. Advancing from the road to a position where we could command the most advantageous view, the three valleys lay stretched out in their varying sinuosities before us, the mountainous country on the south, whence the waters originated, gradually declining in height, till the dividing boundaries of the three rivers melted into a common centre, and the waters were conjoined into a single stream. These waters are the drainage of all central and northern Switzerland, and we afterwards had occasion to visit their main sources—the lakes of Brienz and Thun, whence issues the Aar; the lakes of Zug and Lucerne, which contribute the Reuss; and the lake of Zurich, which sends forth the Limmat. All are of a lightish green colour, and to our eye the Reuss appeared the largest of the trio. In the race to effect a junction of streams, the Reuss also falls first into the Aar, which, thus vastly increased, runs on a short way till struck upon by the Limmat; the Aar, therefore, has the honour of imparting its name to the united waters, which, after flowing a distance of ten miles to the north, fall into the Rhine and double it in size; the other or primary branch of the Rhine being a similar drainage from above the lake of Constance, and flowing by Schaufhausen to this spot, where it is thus so largely increased.

We spent so much time over this scene of beauty, and I should add historical interest—for the spot before us, on the peninsula formed by the junction of the Aar and the Reuss, was in early ages the site of the great Roman station of Vindonissa, within the broad limits of which, in after times, rose the castle of Hapsburg—that twilight began to draw its curtain around us, while still several miles from our resting-place for the night; and resuming our journey, by a road up the left side of the Limmat, which impetuously shot on its way between high woody banks, the broad disk of the autumnal moon rose over the distant eminences, and, guided by its gentle light, we arrived in due time at the gates of Baden.

Here there was some little difficulty. Originally built under the shadow of a feudal castle on an adjoining height, now in ruins, Baden is at present a walled town, greatly deteriorated by poverty, and we had no wish to have any thing to do with it. A huge vaulted portal, in its decayed wall, stood hospitably open, the doors having been long since removed, and the idea of defence laid aside; but this offered no inducement for our entering the place, and, conducted by Louis, we turned off by a path to the left in search of the boarding-houses at the springs—in fact, the true or practical Baden, the ancient town being only Baden theoretical. Our way was down a long declivity closely overhanging the Limmat, which we heard rushing beneath us, but could scarcely see, as the lofty bank on the farther side shut out the moon's beams from the profound hollow into which we were slowly descending. By Louis's care, we were at length safely landed within the courtyard of the Stadthof, an extensive hotel and boarding-house.

On the morrow, when awakened by the sound of voices without, we found ourselves lodged in a building most romantically situated within the margin of the river, and which was evidently crowded with visiters. We had seen no scene so singular since leaving home. The small town was composed of an irregular cluster of buildings of high and low degree, but mostly hotels of great size, planted at the bottom of the steep bank, and leaving only space for a shady promenade along the side of the Limmat. On the opposite or left bank the ground was equally precipitous, but facing the south was laid out principally as vineyards, with a strip of a village at the foot, to which a wooden bridge gave the readiest access. Among the various hotels and lodging-houses in different quarters, there was a concourse of visiters from Germany as well as distant cantons of Switzerland, fully as numerous as at Spa, but much less *distingué* than at Baden-Baden.

The spot has been celebrated since the days of the Romans for its sanative waters, which are hot and of a sulphureous quality. There are sixteen springs, all rising within perhaps thirty feet of the river: one gushes out near the walls of the Stadthof, within the bed of the stream, and has been covered with a neat stone building, from which the water is drawn for the use of the baths. The aggregate quantity of water thrown up is about a hundred gallons per minute, the springs flowing with equal vigour and heat both day and night. The temperature, if I might judge from feeling, was about 90 degrees Fahrenheit. Every hotel has a spring and baths, the former rushing out as an ever-running fountain in an open court or covered arcade, to which all residents have access. For the benefit of the public, or, properly speaking, visiters of a poorer order, there is a free fountain in the confined patch of street, and here in early morning hundreds were in attendance. I was told that the sending of poor patients to the baths and springs is performed as a conscientious duty by the authorities of almost every canton; public contributions are also made at the bath-houses for the benefit of the humbler order of visitants. Some idea of the great estimation in which the waters are held, may be obtained from the fact that between the 6th of June and 26th of September 1840, 19,530 persons had arrived and spent more or less time in attendance. The bulk of the residents at the time of our visit were a more respectable body of people than we saw any where else in Switzerland in one spot. There were apparently few or no French or English; and the amusements consisted either in loitering about the beautiful banks of the Limmat or making excursions in chairs and on the backs of donkeys to various scenes of interest in the neighbourhood.

THE KNIGHTS OF MALTA.

The institution of the Knights of Malta was one of greater importance and utility in its day than is generally imagined. However slight may be the merit accruing from the Crusades for the recovery of the Holy Land, they are entitled to share in it largely; but they have higher claims, of a much later date, upon the gratitude of the Christian world. Almost by the unaided exertions of this band of brothers, the Ottoman power was held in check, and its extension materially impeded, on the eastern coasts of Europe. This was a great service to the whole of that continent. The Knights of Malta effected, on the bosom of the Mediterranean, what John Sobieski effected on the plains of Austria; and their names should be embalmed along with his in the memory of Christendom.

Towards the middle of the eleventh century, when the Holy Land was entirely in the power of the Mahommedans, the Egyptian caliph, Monstaser-Billah, was induced to permit the erection of a Christian chapel in the city of Jerusalem, with two hospitals, one of them dedicated to St John the Almoner. These were intended for the relief of the numerous pilgrims who then visited Palestine from all Christian countries. After Godfrey of Bouillon conquered the Holy City in 1099, the Hospital of St John became a place of great note as an establishment for healing the wounded and the sick, and was converted by Gerard, its rector, from a secular to a religious institution. He, with his brothers and sisters of charity, formally abjured the world, and assumed as their dress a black gown, having on the left breast a white cross. At the same time, a number of illustrious crusaders, burning with pious zeal, entered the body; and Godfrey of Bouillon endowed it with lands in Brabant. His example was speedily followed by other princes and barons of Europe, until the order grew wealthy, and founded many new houses both in Asia and Europe. The next step was the conjunction of the military with the religious character. Raymond du Puis succeeded to the rectorship; and, having been a brave soldier in his day, he was induced, by the reiterated attacks made on the Christians at their first settlement in the East, to propose to his companions, most of them old soldiers like himself, to join the profession of arms to their other duties. The summons sounded like a trumpet in the ears of the veterans, and Raymond du Puis became the first Grand-master of the Order of the Knights-Hospitallers of St John. Three classes were established in the order—that of the Knights, who were required, at first at least, to prove a noble extraction; that of Chaplains, who were non-military; and that of Half-Knights, or Serving Brothers, who were not of high birth, and whose duties lay both in the hospital and the field. The establishment of commanderies, as the houses were called, in different countries, rendered it proper to establish divisions called Languages in the order, as one for England, one for Germany, and so on. These were at first seven, and finally nine in number. Noble youths from all Europe soon swelled the order of the Hospitallers into a numerous force, and one of great strength, in times when a single mounted knight, cased in armour, was a match for half a dozen of the ordinary soldiery. Their wealth also enabled them to hire large bodies of mercenaries to aid in their enterprises; and their European houses, or commanderies, served as depôts, whence auxiliaries were continually drafted to the wars.

This formidable body remained in Palestine during the entire period of its occupation, complete or partial, by the Latin Christians, witnessing the whole of the nine crusades, rendered necessary by the inveterate determination of the Mahommedans to recover their lost possessions. During all this time, they existed but to fight, having scarcely one month of perfect repose; and in fight they exhibited the most desperate valour on all occasions, though the abstemiousness of their rules was relaxed by degrees. They remained in the Holy Land after kings and barons had all yielded up the cause in despair. At length, in the year 1291, the Sultan Saladin drove them from their last stronghold of Saint John d'Acre, and compelled them to take refuge in Cyprus, then under a Latin king. They there summoned all their commanderies to send members and supplies, and were soon enabled once more to establish themselves as a powerful naval as well as military body. Their views were to harass the Mahommedans of Syria and Egypt by sea. One expedition more they made against the Saracens of Jerusalem; but they found both that city, and the other fortresses of the country, to be in so ruinous a state, that the approach of the Egyptian sultan forced them to fly to their ships. It was immediately after this step that Fulk de Villaret, twenty-fourth grand-master of the order, seeing the hopelessness of any secure settlement of it on lands not its own, projected a great and important conquest—that of the island of Rhodes. Rhodes is about one hundred and twenty miles in circumference, and close on the coast of Asia Minor. It was at this time nominally a possession of the Greek emperor, Andronicus; but in reality was in the power of Saracenic pirates, mixed with Greeks of the same stamp. Fulk de Villaret gathered his war-galleys, and made a bold descent on the isle. The resistance was obstinate, and years elapsed ere the knights succeeded in planting the standard of the white cross on the walls of Rhodes. But they persisted in the siege till they made it their own.

The fate of the Knights Templars, almost at this very moment, showed the importance and necessity of such a fixed settlement. Returning to its European commanderies, this wealthy order, the rival of that of the Hospitallers in fame and power, became soon a subject of jealousy and avaricious envy to the monarchs of the time, and especially to Philip of France. In concert with the pope, that sovereign, under colour of forged charges of criminality, wrested its property from the order, and subjected its members to imprisonment, tortures, and death. Other countries also abolished the order, but without the same accompanying barbarities. Philip of France was partly disappointed, for the Pope forced him to accede to a general edict, giving the Templar possessions to the Knights of St John.

The latter body was greatly increased in power by these accessions, and it became more common than ever for the younger nobility of Europe to enter the order of the Hospitallers. Riches brought with it augmented luxury and many evils, but the knights were still kept in high military condition. A new race of the followers of Mahommed appeared against them. *Othman* (the Bone-Breaker), who gave a permanent name to the Turkish nation, possessed, with a tribe of Turkomauns, the region of Asia Minor adjoining Rhodes. He attacked the knights in their city; but, though one of the most tried and renowned warriors of his race, he failed to make the slightest impression on them. Similar assaults were renewed in more alarming shapes in the course of the years immediately succeeding. Betwixt the year 1310, when the order settled at Rhodes, and the year 1453, when the Turks took Constantinople, and founded a new empire, the Knights of St John fought many great battles, by sea and land, with the two Mahommedan powers in their neighbourhood, the Egyptian and Turkish. It is amazing to reflect, that this comparatively small body of men should not only have foiled so many efforts made by these powerful sovereignties to reduce them and take their stronghold, but should have even obtained possession of Cos and other Greek islands, captured Smyrna and held it for a long period, and made various expeditions against Syria and other places, as if possessed of the population and resources of a strong and warlike nation. They proved an unextractible thorn in the sides of the foes of Christianity.

Our space will only permit of a mere sketch being given of the career of the order; but we may allude specially to one event, the most important in its annals. The hour came at length for the fall of Rhodes, after the knights had held it for more than two hundred years. Solyman the Magnificent resolved at any price to oust them from their stronghold. We quote from Sutherland's history of the order, in the passage that follows. In June 1522, "a signal from Mount St Stephen intimated to the Rhodians that the Turkish fleet was in sight. Countless sails studded the Lycian Strait; and tumult and wailing instantly rose from every quarter of the city. The gates were formally shut, and public prayers were offered up in the churches, imploring Heaven to grant the victory to the champions of the Cross. This done, the whole population hurried to the ramparts and towers, to behold the terrible armament that threatened them with destruction. Four hundred sail swept past the mouth of the haven with the pomp and circumstance of a triumphal pageant; and on board this mighty fleet were 140,000 soldiers, exclusive of 60,000 serfs, torn from the forests of the Danube, to serve as pioneers." Six hundred knights, with less than five thousand regular troops, and a comparatively weak body of citizens and peasants, formed the whole force prepared to oppose this immense armament, the leader of which, Solyman in person, told his troops that he had come to Rhodes "to conquer or die." For upwards of three months, the most awful scenes of carnage took place daily, after the siege had begun. For one man who fell among the knights, twenty fell among the Turks; but even this proportion was ruinous to the former. In one assault, fifteen thousand Turks were slain. By degrees, every one of the ramparts of Rhodes was in ruins, yet still the knights and their grand-master, a venerable old man, were unconquerable. They filled the breaches with their mailed bodies. Frequently, Solyman half-resolved to give up the struggle, and frequently he threatened his officers with death for their want of success. He proposed various capitulations, and by capitulation was the siege finally closed. The knights were unvanquished, but Rhodes was untenable. Twelve days were given them to embark their property; and, on the 1st of January 1593, the remnant of the Rhodian Christians went on board their galleys, a homeless band. Before that departure, Solyman, who had in him great points of character sought an interview with L'Isle

Adam, the grand-master. "For a time the two warriors eyed each other with piercing glances. The venerable and majestic port of the grand-master won the admiration of the youthful despot; and he magnanimously requested his interpreter to console the Christian chief with the assurance, that even the bravest of men were liable to become the sport of fortune. He invited him, at the same time, to embrace the Mahommedan faith, and enter his service, since the Christian princes, who had abandoned him in his extremity, did not merit the alliance of so redoubted a chief; and, by way of a bribe, promised to advance him to the highest dignities in his empire, and make him one of his chosen councillors. The grand-master answered, that were he to dishonour his grey hairs by becoming a traitor and renegade, he would only show how unworthy he was of the high opinion which his conqueror entertained of him; and that he would far rather retire into obscurity, or part with life itself, than be accounted a recreant and apostate by his own people. Solyman dismissed the venerable knight with honour; and said to Achmet Pasha, who was in attendance, 'It is not without regret that I drive this unfortunate old man, full of sorrow, from his home.'"

The Knights of St John had still their commanderies, rich and powerful, over Europe, though Henry VIII., about this very time, abolished the order in England. But their importance was yet sufficient to procure for them the cession of the island of Malta, where their numbers were soon recruited. Removed in some measure, however, from the sphere of Turkish and Egyptian operations, the knights came now into hostility with new enemies of their faith. The African coasts swarmed at this time, as they also did at a much later date, with pirates, who filled their coffers with gold, and their dungeons with captives, from the European states. In concert with the Emperor Charles, the Knights of Malta undertook a great expedition against the two Barbarossas, the most famous pirates of the day, who had gained sovereign power in Algiers and Tunis, by expelling the rightful princes. Tunis and Goletta were conquered on this occasion, chiefly by the dauntless valour of the Knights of St John, and the rightful governments were re-established. But, in a future expedition, the order lost a great force before Algiers, and a garrison of theirs was expelled with vast loss from Tripoli.

For the next half century, the knights waged incessant war with the piratical Mahommedans, both of Africa and the Turco-Grecian islands. The importance of their services to European commerce was fully shown by the renewed attempts of the Ottoman Porte to suppress them. In 1565, one great attempt was made by 30,000 Turks on the island. The assault of the small fort of St Elmo will show the bravery of the knights in a fair light:—"At daybreak on the 16th of June, the Turkish galleys commenced a furious cannonade against the seaward rampart; and at the same time the land batteries shattered into ruin the still remaining fortifications. This done, the Osmanlis entered the ditch to the sound of their proud but barbarous music; and, at the discharge of a signal-gun, rushed impetuously to the assault, covered by 4000 harquebusiers and cross-bowmen, who, from their post in the trenches, shot down every Christian soldier who showed himself in the breach. Behind that deadly gap stood the knights and their scant battalion, armed with pikes and spontoons, and forming, as it were, a living wall. Between every three soldiers stood a knight, the better to sustain the courage of those who had nothing of chivalrous renown to uphold them. In vain did the Turks dash themselves on this impenetrable phalanx. When swords and pikes were broken, the Christian soldiers grappled with their antagonists, and terminated the death-struggle with their daggers. The burning hoops were of eminent service in this combat; and the cries of the wretches whom they begirt, added greatly to the horror of the fight. It was a cheering circumstance to the defenders of the fort, that the conflict was maintained under the eyes of their friends in the Bourg, who they feared had begun to doubt their bravery. Amid the thunder of the artillery, and the groans of the dying, their ears were gladdened at intervals by encouraging shouts wafted across the haven from the distant ramparts; and the guns of Forts St Angelo and St Michael played incessantly, and with considerable effect, on the Turkish lines. At the end of six hours, the knights, covered with wounds, and blistered by the scorching rays of the sun, had the consolation to hear a retreat sounded from the enemy's trenches; and the Turks reluctantly retired, leaving behind them 2000 dead." When the *last* defender fell, the Turks became masters of St Elmo. But they were ultimately driven from the island, with a loss of 25,000 men.

The order was congratulated by all Europe on this occasion. For the next century, it continued to maintain maritime combats of lesser note, chiefly in contest with the African pirates. But its utility and its wealth gradually departed. Each of the powers of Europe became owners of great fleets, which reduced the galleys of St John to total insignificance; and there being no longer occasion for their services, the possessions of the knights slipt by degrees from their grasp. Besides, islands could no longer be wrested even from Mahommedans, or expeditions made against them; treaties and alliances bound both parties to peace. At length, in the time of the sixty-ninth grand-master, Bonaparte appeared before Valetta, the Maltese capital, and, after a feeble show of opposition, took possession of the island. The inhabitants seem to have been utterly tired of the rule of the knights; and the latter ceded Malta to the French, by a treaty which bound them at once to quit the isle. They received petty annuities in lieu of this their ancient possession.

The British expelled the French; but the knights returned to Malta no more. An attempt at the re-establishment of the order was made by Paul of Russia, which ended in nothing. Thus fell the renowned brotherhood of the Knights Hospitallers of St John. The extent of their possessions at one time, as well as those of the Templars, is shown by the numberless places, in Britain and elsewhere, to which they have permanently given names.

MELANCHOLY MOMENTS.

It is not pain, it is not grief,
That weigheth down my spirit now;
A holier feeling craves relief
For burden'd breast, for burning brow:
Nor pain nor grief might thus me bow,
Nor theirs the sorrow of the hour;
A deeper sadness this, I trow,
Bound on me by some sterner power.

Hast ever long'd to weep thy fill,
And felt that thou in vain must pine—
Felt fall on thee the leaden chill
Which freezes tears within their shrine?
Hast ever loved a full blue eye
Whose heaven mote ne'er upon thee shine?
Or seen a bosom heave the sigh
Thou knew'st was no response to thine?

Hast ever felt full many a thought
Of tenderness within thee swell,
By Nature to thy spirit taught,
Yet blighting that wherein they dwell?
Thy misery to love too well,
Since doomed still to love alone—
Affection sickening in her cell,
For lack of things to rest upon.

And hast thou known what 'tis to gaze,
In pensive musing, fancy free,
Back on the joyous sunny days
Of boyhood and of infancy?
Hast felt the rushing memories press,
And wish'd the troublers not to be?—
Mementos of thy loneliness!—
Then, stranger, thou canst feel for me.

And if a mother's eye did bless
Thine own, and fondly on thee smiled,
A mother's bosom once did press
Thine own—though only when a child:
Or if a sister fair and mild
Hath laid her soft cheek thine upon,
Then fathom thou the anguish wild
Born of the thought that *both* are gone.

Dearer than home to exile's thought,
Than to the hero battle's van,
Than science to the sage she taught,
Or chieftain to his Highland clan—
Dearer than to the deluged earth
The bow of hope that heaven did span,
Dearer than all the world is worth—
Is woman to the heart of man!

Prate not of friends: there is a smart
That mocks at friendship's nicest skill;
There is a void within the heart
That even friendship may not fill:
There is within a mystic will,
Aye calling at the spirit's shrine—
A something that demandeth still
A breast to blend and beat with thine:—

A breast will be thine own for aye,
Will bleed at ought that brings thee pain,
Will languish when thou art away,
And leap when it on thine hath lain.
Oh give me such, or else give back,
Ye years, the blessedness ye've ta'en!—
The springiness my spirits lack—
And let me be a boy again!

D.

GUANO MANURE.

The sterile soils of the South American coast are manured with a substance called guano, consisting of urate of ammonia and other ammoniacal salts, by the use of which a luxuriant vegetation and the richest crops are obtained. Guano has lately been imported in considerable quantities into Liverpool and several other English ports, and is now experimentally employed as a manure by English agriculturists. A consideration of its composition and mode of action cannot therefore fail to be acceptable. Much speculation has arisen as to the true origin of guano, but the most certain proof is now afforded that it has been produced by the accumulation of the excrements of the innumerable sea-fowl which inhabit the islands upon which it is found. Meyen, the latest writer upon this subject, completely coincides with this opinion, for he says—"their number is Legion; they completely cloud the sun when they rise from their resting-place in the morning, in flocks of miles in length." Yet, notwithstanding their great number, thousands of years must have elapsed before the excrements could have accumulated to such a thickness as they possess at present. Guano has been used by the Peruvians as a manure since the twelfth century; and Rivero states that the annual consumption of guano, for the purposes of agriculture, amounts to 40,000 fanegas (7600 quarters). The increase of crops obtained by the use of guano is very remarkable. According to the same authority, the crop of potatoes is increased forty-five times by means of it, and that of maize thirty-five times. The composition of guano points out how admirably it is fitted for a manure; for not only does it contain ammoniacal salts in abundance, but also those inorganic constituents which are indispensable for the development of plants.—*Professor Liebig's New Work.*

WAR.

What, speaking in quite unofficial language, is the net purport of war? To my own knowledge, for example, there dwell and toil, in the British village of Dumdrudge, usually some five hundred souls. From these, by certain "natural enemies" of the French, there are successively selected, during the French war, say thirty able-bodied men: Dumdrudge, at her own expense, has suckled and nursed them; she has, not without difficulty and sorrow, fed them up to manhood, and even trained them to crafts, so that one can weave, another build, another hammer, and the weakest can stand under thirty stone avoirdupois. Nevertheless, amid much weeping and swearing, they are selected; all dressed in red, and shipped away at the public charge, some 2000 miles, or say, only to the south of Spain; and fed there till wanted. And now, to that same spot in the south of Spain, are thirty similar French artisans, from a French Dumdrudge, in like manner wending; till at length, after infinite effort, the parties come into actual juxtaposition, and thirty stand fronting thirty, each with a gun in his hand. Straightway the word "Fire!" is given, and they blow the souls out of one another; and, instead of sixty brisk useful craftsmen, the world has sixty dead carcasses, which it must bury and anon shed tears for. Had these men any quarrel? Busy as the devil is, not the smallest. They lived far enough apart, were the entirest strangers nay, in so wide a universe, there was even, unconsciously by commerce, some mutual helpfulness between them. How then? Simpleton! their governors had fallen out; and, instead of shooting one another, had the cunning to make these poor blockheads shoot.—*Carlyle's Sartor Resartus.*

BENEFIT OF A FREE PRESS.

A free press is the parent of much good in a state. But even a licentious press is a far less evil than a press that is enslaved, because both sides may be heard in the former case, but not in the latter. A licentious press may be an evil, an enslaved press must be so; for an enslaved press may cause error to be more current than wisdom, and wrong more powerful than right; a licentious press cannot effect these things, for if it gives the poison, it gives also the antidote, which an enslaved press withholds. An enslaved press is doubly fatal—it not only takes away the true light, for in that case we might stand still, but it sets up a false one, that decoys us to our destruction.—*Lacon.*

TULIPOMANIA IN HOLLAND.

When the Tulipomania infected Holland, and single roots were sold for many hundred pounds, we are told—"People who had been absent from Holland, and whose chance it was to return when this folly was at its maximum, were sometimes led into awkward dilemmas by their ignorance. There is an amusing instance of the kind related in Blainville's Travels. A wealthy merchant, who prided himself not a little on his rare tulips, received upon one occasion a very valuable consignment of merchandise from the Levant. Intelligence of its arrival was brought him by a sailor, who presented himself for that purpose at the counting-house, among bales of goods of every description. The merchant, to reward him for his news, munificently made him a present of a fine red-herring for his breakfast. The sailor had, it appears, a great partiality for onions; and seeing a bulb, very like an onion, lying upon the counter of this liberal trader, and thinking it no doubt very much out of its place among silks and velvets, he slily seized an opportunity, and slipped it into his pocket as a relish for his herring. He got clear off with his prize, and proceeded to the quay to eat his breakfast. Hardly was his back turned, when the merchant missed his valuable *Semper Augustus*, worth 3000 florins, or about L.280 sterling. The whole establishment was instantly in an uproar; search was every where made for the precious root, but it was not to be found. Great was the merchant's distress of mind. The search was renewed, but again without success. At last some one thought of the sailor. The unhappy merchant sprang into the street at the bare suggestion. His alarmed household followed him. The sailor, simple soul! had not thought of concealment. He was found quietly sitting on a coil of ropes, masticating the last morsel of his onion. Little did he dream that he had been eating a breakfast whose cost might have regaled a whole ship's crew for a twelvemonth; or, as the plundered merchant himself expressed it, 'might have sumptuously feasted the Prince of Orange and the whole court of the stadtholder.' Anthony caused pearls to be dissolved in wine to drink the health of Cleopatra; Sir Richard Whittington was as foolishly magnificent in an entertainment to King Henry V.; and Sir Thomas Gresham drank a diamond, dissolved in wine, to the health of Queen Elizabeth, when she opened the Royal Exchange; but the breakfast of this roguish Dutchman was as splendid as either. He had the advantage, too, over his wasteful predecessors; their gems did not improve the taste or the wholesomeness of their wine, while his tulip was quite delicious with his red-herring."—*Mackay's History of Popular Delusions.*

ULTIMATE SUCCESS OF GOOD SCHEMES.

Many schemes ridiculed as Utopian, decried as visionary, and declaimed against as impracticable, will be realised the moment the march of sound knowledge has effected this for our species—that of making men wise enough to see their true interests, and disinterested enough to pursue them.—*Lacon.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.
Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

THE TWO MISS SMITHS.

A TRUE STORY.

IN a certain town in the west of England, which shall be nameless, there dwelt two maiden ladies of the name of Smith; each possessing a small independence, each residing, with a single maid-servant, in a small house, the drawing-room floor of which was let, whenever lodgers could be found; each hovering somewhere about the age of fifty, and each hating the other with a restless and implacable enmity. The origin of this aversion was the similarity of their names; each was Miss C. Smith, the one being called Cecilia, the other Charlotte—a circumstance which gave rise to such innumerable mistakes and misunderstandings, as were sufficient to maintain these ladies in a constant state of irritability and warfare. Letters, messages, invitations, parcels, bills, were daily mis-sent, and opened by the wrong person, thus exposing the private affairs of one to the other; and as their aversion had long ago extinguished every thing like delicacy on either side, any information so acquired was used without scruple to their mutual annoyance. Presents, too, of fruit, vegetables, or other delicacies from the neighbouring gentry, not unfrequently found their way to the wrong house; and if unaccompanied by a letter, which took away all excuse for mistake, they were appropriated without remorse, even when the appropriating party felt confident in her heart that the article was not intended for her; and this not from greediness or rapacity, but from the absolute delight they took in vexing each other. It must be admitted, also, that this well-known enmity was occasionally played upon by the frolic-loving part of the community, both high and low; so that over and above the genuine mistakes, which were of themselves quite enough to keep the poor ladies in hot water, every now and then some little hoax was got up and practised upon them, such as fictitious love-letters, anonymous communications, and so forth. It might have been imagined, as they were not answerable for their names, and as they were mutual sufferers by the similarity, one having as much right to complain of this freak of fortune as the other, that they might have entered into a compact of forbearance, which would have been equally advantageous to either party; but their naturally acrimonious dispositions prevented this, and each continued as angry with the other as she could have been if she had had a sole and indefeasible right to the appellation of *C. Smith*, and her rival had usurped it in a pure spirit of annoyance and opposition. To be quite just, however, we must observe that Miss Cecilia was much the worse of the two; by judicious management Miss Charlotte might have been tamed, but the malice of Miss Cecilia was altogether inexorable.

By the passing of the Reform Bill, the little town wherein dwelt these belligerent powers received a very considerable accession of importance; it was elevated into a borough, and had a whole live member to itself, which, with infinite pride and gratification, it sent to parliament, after having extracted from him all manner of pledges, and loaded him with all manner of instructions as to how he should conduct himself under every conceivable circumstance; not to mention a variety of bills for the improvement of the roads and markets, the erection of a town-hall, and the reform of the systems of watching, paving, lighting, &c., the important and consequential little town of B——.

A short time previous to the first election—an event which was anticipated by the inhabitants with the most vivid interest—one of the candidates, a country gentleman who resided some twenty miles off, took a lodging in the town, and came there with his wife and family, in order, by a little courtesy and a few entertainments, to win the hearts of the electors and their friends; and his first move was to send out invitations for a tea and card party, which, in due time, when the preparations were completed, was to be followed by a ball. There was but one milliner and dressmaker of any consideration in the town of B——, and it may be imagined that on so splendid an occasion her services were in great request—so much so, that in the matter of head-dresses, she not only found that it would be impossible, in so short a period, to fulfil the commands of her customers, but also that she had neither the material nor the skill to give them satisfaction. It was, therefore, settled that she should send off an order to a house in Exeter, which was the county town, for a cargo of caps, togues, turbans, &c., fit for all ages and faces—"such as were not disposed of to be returned;" and the ladies consented to wait, with the best patience they could, for this interesting consignment, which was to arrive without fail on the Wednesday, Thursday being the day fixed for the party. But the last coach arrived on Wednesday night without the expected boxes; however, the coachman brought a message for Miss Gibbs, the milliner, assuring her that they would be there the next morning without fail.

Accordingly, when the first Exeter coach rattled through the little street of B——, which was about half-past eleven, every head that was interested in the freight was to be seen looking anxiously out for the deal boxes; and, sure enough, there they were—three of them—large enough to contain caps for the whole town. Then there was a rush up stairs for their bonnets and shawls, and in a few minutes troops of ladies, young and old, were seen hurrying towards the market-place, where dwelt Miss Gibbs—the young in pursuit of artificial flowers, gold bands, and such-like adornments—the elderly in search of a more mature order of decoration. Amongst the candidates for finery, nobody was more eager than the two Miss Smiths; and they had reason to be so, not only because they had neither of them any thing at all fit to be worn at Mrs Hanaway's party, which was in a style much above the entertainments they were usually invited to, but also because they both invariably wore turbans, and each was afraid that the other might carry off the identical turban that might be most desirable for herself. Urged by this feeling, so alert were they, that they were each standing at their several windows when the coach passed, with their bonnets and cloaks actually on—ready to start for the plate!—determined to reach Miss Gibbs's in time to witness the opening of the boxes. But "who shall control his fate?" Just as Miss Cecilia was stepping off her threshold, she was accosted by a very gentlemanly-looking person, who, taking off his hat, with an air really irresistible, begged to know if he had "the honour of seeing Miss Smith"—a question which was, of course, answered in the affirmative.

"I was not quite sure," said he, "whether I was right, for I had forgotten the number; but I thought it was sixty," and he looked at the figures on the door.

"This *is* sixty, sir," said Miss Cecilia; adding to herself, "I wonder if it was sixteen he was sent to," for at number sixteen lived Miss Charlotte.

"I was informed, madam," pursued the gentleman, "that I could be accommodated with apartments here—that you had a first floor to let."

"That is quite true, sir," replied Miss Cecilia, delighted to let her rooms, which had been some time vacant, and doubly gratified when the stranger added, "I come from Bath, and was recommended by a friend of yours, indeed probably a relation, as she bears the same name, Miss Joanna Smith."

"I know Miss Joanna very well, sir," replied Miss Cecilia; "pray, walk up stairs, and I'll show you the apartments directly. (For," thought she, "I must not let him go out of the house till he has taken them, for fear he should find out his mistake.) Very nice rooms, sir, you see—every thing clean and comfortable—a pretty view of the canal in front—just between the baker's and the shoemaker's; you'll get a peep, sir, if you step to this window. Then it's uncommonly lively; the Exeter and Plymouth coaches, up and down, rattling through all day long, and indeed all night too, for the matter of that. A beautiful little bed-room, back, too, sir—Yes, as you observe, it certainly does look over a brick kiln; but there's no dust—not the least in the world—for I never allow the windows to be opened: altogether, there can't be a pleasanter situation than it is."

The stranger, it must be owned, seemed less sensible of all these advantages than he ought to have been; however, he engaged the apartments: it was but for a short time, as he had come there about some business connected with the election; and as Miss Joanna had so particularly recommended him to the lodging, he did not like to disoblige her. So the bargain was struck: the maid received orders to provision the garrison with bread, butter, tea, sugar, &c., &c., whilst the gentleman returned to the inn to dispatch Boots with his portmanteau and carpet-bag.

"You were only just in time, sir," observed Miss Cecilia, as they descended the stairs, "for I expected a gentleman to call at twelve o'clock to-day, who I am sure would have taken the lodgings."

"I should be sorry to stand in his way," responded the stranger, who would not have been at all sorry for an opportunity of backing out of the bargain. "Perhaps you had better let him have them—I can easily get accommodated elsewhere."

"Oh dear, no, sir; dear me! I wouldn't do such a thing for the world!" exclaimed Miss Cecilia, who had only thrown out this little inuendo by way of binding her lodger to his bargain, lest, on discovering his mistake, he should think himself at liberty to annul the agreement. For well she knew that it *was* a mistake: Miss Joanna of Bath was Miss Charlotte's first cousin, and, hating Miss Cecilia, as she was in duty bound to do, would rather have sent her a dose of arsenic than a lodger, any day. She had used every precaution to avoid the accident that had happened, by writing on a card, "Miss Charlotte Smith, No. 16, High Street, B——, *opposite the linen-draper's shop;*" but the thoughtless traveller, never dreaming of the danger in which he stood, lost the card, and, trusting to his memory, fell into the snare.

Miss Cecilia had been so engrossed by her anxiety to hook this fish before her rival could have a chance of throwing out a bait for him, that, for a time, she actually forgot Miss Gibbs and the turban; but now that her point was gained, and she felt sure of her man, her former care revived with all its force, and she hurried along the street towards the market-place, in a fever of apprehension lest she should be too late. The matter certainly looked ill; for, as she arrived breathless at the door, she saw groups of self-satisfied faces issuing from it, and, amongst the rest, the obnoxious Miss Charlotte's physiognomy appeared, looking more pleased than any body.

"Odious creature!" thought Miss Cecilia; "as if she supposed that any turban in the world could make her look tolerable!" But Miss Charlotte did suppose

it; and, moreover, she had just secured the very identical turban that, of all the turbans that ever were made, was most likely to accomplish this desideratum—at least so she opined.

Poor Miss Cecilia! Up stairs she rushed, bouncing into Miss Gibbs's little room, now strewed with finery. "Well, Miss Gibbs, I hope you have something that will suit me?"

"Dear me, mem," responded Miss Gibbs, "what a pity you did not come a little sooner. The only two turbans we had are just gone—Mrs Gosling took one, and Miss Charlotte Smith the other—two of the beautifullest—here they are, indeed—you shall see them;" and she opened the boxes in which they were deposited, and presented them to the grieved eyes of Miss Cecilia.

She stood aghast! The turbans were very respectable turbans indeed; but, to her disappointed and eager desires, they appeared worthy of Mahomet the prophet, or the Grand Sultana, or any other body, mortal or immortal, that has ever been reputed to wear turbans. And this consummation of perfection she had lost!—lost just by a neck!—missed it by an accident, that, however gratifying she had thought it at the time, she now felt was but an inadequate compensation for her present disappointment. But there was no remedy. Miss Gibbs had nothing fit to make a turban of; besides, Miss Cecilia would have scorned to appear in any turban that Miss Gibbs could have compiled, when her rival was to be adorned with a construction of such superhuman excellence. No! the only consolation she had was to scold Miss Gibbs for not having kept the turbans till she had seen them, and for not having sent for a greater number of turbans. To which objurgations Miss Gibbs could only answer, "That she had been extremely sorry, indeed, when she saw the ladies were bent upon having the turbans, as she had ordered two entirely with a view to Miss Cecilia's accommodation; and, moreover, that she was never more surprised in her life than when Mrs Gosling desired one of them might be sent to her, because Mrs Gosling never wore turbans; and if Miss Gibbs had only foreseen that she would have pounced upon it in that way, she, Miss Gibbs, would have taken care she should never have seen it at all," &c., &c., &c.—all of which the reader may believe, if he or she choose. As for Miss Cecilia, she was implacable, and she flounced out of the house, and through the streets, to her own door, in a temper of mind that rendered it fortunate, as far as the peace of the town of B—— was concerned, that no accident brought her in contact with Miss Charlotte on the way.

As soon as she got into her parlour, she threw off her bonnet and shawl, and plunging into her armchair, she tried to compose her mind sufficiently to take a calm view of the dilemma, and determine on what line of conduct to pursue—whether to send an excuse to Mrs Hanaway, or whether to go to the party in one of her old head-dresses. Either alternative was insupportable. To lose the party—the game at loo, the distinction of being seen in such good society—it was too provoking; besides, very likely people would suppose she had not been invited; Miss Charlotte, she had no doubt, would try to make them believe so. But then, on the other hand, to wear one of her old turbans was so mortifying—they were so very shabby, so unfashionable—on an occasion, too, when every body would be so well-dressed! Oh, it was aggravating—vexatious, in the extreme! She passed the day in reflection—chewing the cud of sweet and bitter fancies; recalling to herself how well she looked in the turban—for she had tried it on; figuring what would have been Miss Charlotte's mortification if she had been the disappointed person—how triumphantly she, Miss Cecilia, would have marched into the room with the turban on her head—how crest-fallen the other would have looked; and then she varied her occupation by resuscitating all her old turbans, buried in antique bandboxes deep in dust, and trying whether it were possible, out of their united materials, to concoct one of the present fashionable shape and dimensions. But the thing was impracticable: the new turban was composed of crimson satin and gold lace, hers of pieces of muslin and gauze.

When the mind is very much engrossed, whether the subject of contemplation be pleasant or unpleasant, time flies with inconceivable rapidity; and Miss Cecilia was roused from her meditations by hearing the clock in the passage strike four, warning her that it was necessary to come to some decision, as the hour fixed for the party, according to the primitive customs of B——, was half-past seven, when the knell of the clock was followed by a single knock at the door, and the next moment her maid walked into the room with—what do you think?—the identical crimson and gold turban in her hand!

"What a beauty!" cried Susan, turning it round, that she might get a complete view of it in all its phases.

"Was there any message, Sue?" inquired Miss Cecilia, gasping with agitation, for her heart was in her throat.

"No, ma'am," answered Sue; "Miss Gibbs's girl just left it; she said it should have come earlier, but she had so many places to go to."

"And she's gone, is she, Susan?"

"Yes, ma'am, she went directly—she said she hadn't got half through yet."

"Very well, Susan, you may go; and remember, I'm not at home if any body calls; and if any message comes here from Miss Gibbs, you'll say I'm gone out, and you don't expect me home till very late."

"Very well, ma'am."

"And, I say, Susan, if they send here to make any inquiries about that turban, you'll say you know nothing about it, and send them away."

"Very well, ma'am," said Susan, and down she dived to the regions below.

Instead of four o'clock, how ardently did Miss Cecilia wish it were seven; for the danger of the next three hours was imminent. Well she understood how the turban had got there—it was a mistake of the girl—but the chance was great that, before seven o'clock arrived, Miss Charlotte would take fright at not receiving her head-dress, and would send to Miss Gibbs to demand it, when the whole thing would be found out. However, no message came: at five o'clock, when the milk-boy rang, Miss Cecilia thought she should have fainted; but that was the only alarm. At six she began to dress, and at seven she stood before her glass in full array, with the turban on her head. She thought she had never looked so well; indeed, she was sure she had not. The magnitude of the thing gave her an air, and indeed a feeling of dignity and importance that she had never been sensible of before. The gold lace looked brilliant even by the light of her single tallow candle; what would it do in a well-illuminated drawing-room! then the colour was strikingly becoming, and suited her hair exactly—Miss Cecilia, we must here observe, was quite grey; but she wore a frontlet of dark curls, and a little black silk skull-cap, fitted close to her head, which kept all neat and tight under the turban.

She had not far to go; nevertheless, she thought it would be as well to set off at once, for fear of accidents, even though she lingered on the way to fill up the time, for every moment the danger augmented; so she called to Susan to bring her cloak, and her calash, and her overalls, and being well packed up by the admiring Sue, who declared the turban was "without exception the beautifullest thing she ever saw," she started; determined, however, not to take the direct way, but to make a little circuit by a back street, lest, by ill luck, she should fall foul of the enemy.

"Susan," said she, pausing as she was stepping off the threshold, "if any body calls, you'll say I have been gone to Mrs Hanaway's some time; and, Susan, just put a pin in this calash to keep it back, it falls over my eyes so that I can't see;" and Susan pinned a fold in the calash, and away went the triumphant Miss Cecilia. She did not wish to be guilty of the vulgarity of arriving first at the party; so she lingered about till it wanted a quarter to eight, and then she knocked at Mrs Hanaway's door, which a smart footman immediately opened, and, with the alertness for which many of his order are remarkable, proceeded to disengage the lady from her external coverings—the cloak, the overalls, the calash; and then, without giving her time to breathe, he rushed up the stairs, calling out, "Miss Cecilia Smith;" whilst the butler, who stood at the drawing-room door, threw it open, reiterating, "Miss Cecilia Smith;" and in she went. But, oh! reader, little do you think, and little did she think, where the turban was that she imagined to be upon her head, and under the supposed shadow of which she walked into the room with so much dignity and complacence. It was below in the hall, lying on the floor, fast in the calash, to which Susan, ill-starred wench! had pinned it; and the footman, in his cruel haste, had dragged them both off together.

With only some understrappings on her cranium, and altogether unconscious of her calamity, smiling and bowing, Miss Cecilia advanced towards her host and hostess, who received her in the most gracious manner, thinking, certainly, that her taste in a head-dress was peculiar, and that she was about the most extraordinary figure they had ever beheld, but supposing that such was the fashion she chose to adopt—the less astonished or inclined to suspect the truth, from having heard a good deal of the eccentricities of the two spinsters of B——. But to the rest of the company, the appearance she made was inexplicable; they had been accustomed to see her ill dressed, and oddly dressed, but such a flight as this they were not prepared for. Some whispered that she had gone mad; others suspected that it must be accident—that somehow or other she had forgotten to put on her head-dress; but even if it were so, the joke was an excellent one, and nobody cared enough for her to sacrifice their amusement by setting her right. So Miss Cecilia, blessed in her delusion, triumphant and happy, took her place at the whist table, anxiously selecting a position which gave her a full view of the door, in order that she might have the indescribable satisfaction of seeing the expression of Miss Charlotte's countenance when she entered the room—that is, if she came; the probability was, that mortification would keep her away.

But no such thing—Miss Charlotte had too much spirit to be beaten out of the field in that manner. She had waited with patience for her turban, because Miss Gibbs had told her, that, having many things to send out, it might be late before she got it; but when half-past six arrived, she became impatient, and dispatched her maid to fetch it. The maid returned, with "Miss Gibbs's respects, and the girl was still out with the things; she would be sure to call at Miss Charlotte's before she came back." At half-past seven there was another message, to say that the turban had not arrived; by this time the girl had done her errands, and Miss Gibbs, on questioning her, discovered the truth. But it was too late—the mischief was irreparable—Susan averring, with truth, that her mistress had gone to Mrs Hanaway's party some time, with the turban on her head.

We will not attempt to paint Miss Charlotte's feelings—that would be a vain endeavour. Rage took possession of her soul; her attire was already complete, all but the head-dress, for which she was waiting. She selected the best turban she had, threw on her cloak and calash, and in a condition of mind bordering upon frenzy, she rushed forth, determined, be the consequences what they might, to claim her turban, and expose Miss Cecilia's dishonourable conduct before the whole company.

By the time she arrived at Mrs Hanaway's door, owing to the delays that had intervened, it was nearly half-past eight; the company had all arrived; and whilst the butler and footmen were carrying up the refreshments, one of the female servants of the establishment had come into the hall, and was endeavouring to introduce some sort of order and classification amongst the mass of external coverings that had been hastily thrown off by the ladies; so, when Miss Charlotte knocked, she opened the door and let her in, and proceeded to relieve her of her wraps.

"I suppose I'm very late," said Miss Charlotte, dropping into a chair to seize a moment's rest, whilst the woman drew off her boots, for she was out of breath with haste, and heated with fury.

"I believe every body's come, ma'am," said the woman.

"I should have been here some time since," proceeded Miss Charlotte, "but the most shameful trick has been played me about my—my—Why—I declare—I really believe"—— and she bent forward, and picked up the turban—the identical turban, which, disturbed by the maid-servant's manœuvres, was lying upon the floor, still attached to the calash by Sukey's unlucky pin.

Was there ever such a triumph? Quick as lightning, the old turban was off and the new one on, the maid with bursting sides assisting in the operation; and then, with a light step and a proud heart, up walked Miss Charlotte, and was ushered into the drawing-room.

As the door opened, the eyes of the rivals met. Miss Cecilia's feelings were those of disappointment and surprise. "Then she has got a turban too! How could she have got it?" and she was vexed that her triumph was not so complete as she had expected. But Miss Charlotte was in ecstacies. It may be supposed she was not slow to tell the story; it soon flew round the room, and the whole party were thrown into convulsions of laughter. Miss Cecilia, alone, was not in the secret; and as she was successful at cards, and therefore in good humour, she added to their mirth, by saying that she was glad to see every body so merry, and by assuring Mrs Hanaway, when she took her leave, that it was the gayest party she had ever seen in B——. "I am really ashamed," said Mrs Hanaway, "at allowing the poor woman to be the jest of my company; but I was afraid to tell her the cause of our laughter, from the apprehension of what might have followed." "And it must be admitted," said her husband, "that she well deserves the mortification that awaits her when she discovers the truth."

Poor Miss Cecilia *did* discover the truth, and never was herself again. She parted with her house, and went to live with a relation at Bristol; but her spirit was broken; and, after going through all the stages of

a discontented old age—ill temper, passion, peevishness, and fatuity—she closed her existence, as usual with persons of her class, unloved and unlamented.

A CHAPTER ON THE SOPHISMS.

Logic, if we adopt the latest and most authoritative definition, is to be viewed "as the science, and also as the art, of reasoning." * In either capacity it plainly has to do, not only with the exposition of valid modes of argument, but with the detection of such as are false and fallacious. In systems of logic, therefore, a place is properly devoted to the statement and discussion of the doctrine of Sophisms.

This and the related term *sophist*, both derived from the Greek adjective for *wise*, are not necessarily significant of wrong reasoning and a dishonest reasoner. The latter, indeed, was at first a name of honour, corresponding to our own *philosopher* or *sage*, as is evinced by its application to such men as Solon, the famous Athenian legislator. The title, however, was also conceded to those less calculated to maintain its dignity. Addicting themselves to subtle disputations on tedious trifles; playing with arguments as they would with chessmen; making victory rather than truth the object of their efforts; labouring less to clear their own intellectual vision than to fling dust in the eyes of their opponents—the professors of wisdom soon involved their distinctive appellation in their own disrepute and disgrace. By a natural coincidence, the kindred word *sophisma*, strictly and etymologically denoting a wise saying, came to mean a verbal imposture, a quirk, or fallacy. It is of importance in studying logic to keep clearly in view the distinction between this term and *paralogism*. The latter word is appropriated to palpable violations of the first principles of reasoning; the former denotes violations committed under the appearance of conformity. A *paralogism* is an enemy at once detected and disarmed; a *sophism* is an assassin wearing the mask of friendship.

The classification of the sophisms is no easy task; and, generally speaking, it has been but ill performed. The logicians, in this department, have given a very unworkmanlike specimen of their own lauded art. Nothing can be more indistinct and perplexing, as well as barbarous, than the nomenclature they have conferred on the various modes of fallacious reasoning. The utmost confusion on this head prevails in the common systems of logic: this writer cites as an example of one error what that refers to another; so that a single sophism is often bandied about, like a pauper of ambiguous parentage, through a goodly moiety of the thirteen parishes of Aristotle. A simpler division of the territory and population is, we think, not quite impracticable; the task has been facilitated, if not completely achieved, by the admirable work of Dr Whately. In the distribution we have fixed on, at least in its minor details, practical utility has sometimes been consulted rather than scientific precision.

Errors in reasoning may all be resolved into two grand orders. The fault, in the first instance, may reside in the *expressed argument*, or syllogism, in which the conclusion does not follow from the premises it is apparently involved in; or, secondly, it may lurk in the *concealed process of thought*, dexterously suggested by the sophist, by means of which false premises are regarded as proved, and a false though logically legitimate conclusion is of course necessitated; or in which a conclusion, likewise logically fair, and probably true as matter of fact, but irrelevant or only partially relevant to the point at issue, is admitted as applicable and decisive. In the one class the link is wanting which should bind the inference to the previous positions; in the other, that is absent which should connect either with the real subject of dispute. A sophism, then, which is inseparable from the form of the expression, may perhaps with propriety be styled *syllogistic*; while one attaching to the subject-matter may fall to be treated as *extra-syllogistic*. It is obviously as respects the latter sort that the human mind is most open to deception; and it must at the same time be allowed that logic is here, where her aid is most essential, able to lend it but in scanty measure. The candid will, however, remember that even the meanest modicum of such service is of value, and will not quarrel with an art for failure where absolute success is plainly unattainable.

First, then, of *syllogistic fallacies*; which, indeed, by excessive generalisation, might be comprised under the other class, since they are resolvable into the impression that the same or similar terms are always representative of the same or similar ideas. It is much more convenient, however, to consider them separately.

* "Elements of Logic," by Archbishop Whately—introduction.

Errors of this description may proceed, in the first instance, *from confounding allied meanings of the same term*. Sometimes a word is used both in its primary and in a transitive sense. An instance in point occurs in Mr Burke's Essay on Taste, prefixed to his celebrated disquisition on the Sublime and Beautiful. "It may perhaps appear," he observes, "that there is no material distinction between *the wit and the judgment*, as they both seem to result from different operations of the same faculty of comparing. But in reality, whether they are or are not dependent on the same power of the mind, they differ so very materially in many respects, that a perfect union of *wit and judgment* is one of the rarest things in the world." The words *wit* and *judgment* have each, in the above passage, two distinct significations—the powers thus denominated respectively, and the products of both in peculiarly lively exercise. The inference, of course, does not hold, and the objection it is intended to meet remains unanswered.

Sometimes a metaphorical sense is slipped in, in lieu of the literal. We have heard that a popular orator thus managed to turn to his own account the misfortune of a rival, absent, it seems, from delicate health. "The gentleman has said he cannot venture himself in such an atmosphere, but this is the atmosphere in which I delight to breathe." With an excited crowd, this flimsy artifice, we believe, succeeded in procuring for a stout pair of lungs the applause due to distinguished patriotism.

Occasionally, the extension of a term is changed. Thus Hume, in his Essay on Miracles, argues as if what is granted of ordinary were true of universal *experience*. Because events of this order have not come under the observation of most persons, it is concluded that they could never have come under the observation of any. A like ambiguity has sometimes arisen from the vague application of *authority*. Referring to the writer last named, in his capacity of historian, we may think fit to pronounce him an excellent authority; but unless the term be expressly guarded, we may be represented as intimating our approval of his ethical and metaphysical speculations. By *prophet* we usually understand a person supernaturally commissioned to foretell events; in the works of Mr Carlyle, he is simply a man of commanding genius and vast practical power. *Mystery*, formerly meaning simply a thing unknown, now denotes invariably a thing that cannot be known. The notion popularly attached to *wealth* differs widely from the use of the term by writers on political economy; and much practical mischief has resulted from the belief that a country is prosperous just in proportion as it amasses specie. In these cases and the like, serious mistakes have been generated, and risen to the rank of established and unimpeachable principles, through sheer inattention to the variations of terms. The more closely, indeed, the shades of meaning blend with each other, the more twin-like the similarity that subsists betwixt them, the greater becomes the difficulty of detecting the fraud. Beyond a certain point, indeed, of difference, the most obtuse intellect will refuse to be imposed on. It is absurd, therefore, in an enumeration of fallacies, to assign a place to a glaring play upon words. Though the pun may puzzle, it can never mislead. "He who is most hungry eats most: he who eats least is most hungry; therefore he who eats least eats most." We immediately discover that *eats* in the first member of the syllogism is equivalent to *will eat*, while in the second it stands for *has eaten*; and the apparent contradiction is solved and laughed over.

A second class of errors in reasoning, belonging to the same general order, may arise *from the oversight of certain differences betwixt related terms*. It is often, for example, taken for granted that words springing from a common root only vary among themselves as parts of speech, whereas in fact the radical meaning may have become considerably modified. *Schemer* denotes an artful, truckling, unprincipled individual—qualities which it would be most unfair to ascribe to every man that chanced to be the author of a *scheme*. The two terms are related to each other, but a *devout* man is not therefore a *devotee*. In some instances, however, the derivative and primitive differ too plainly for either to become available for the purposes of sophistry. A mind that would fail to detect the transition from *art* to *artful*, from *pity* to *pitiful*, and the like, must be under the influence of principles of association no less peculiar than those which led the Laird of Ellangowan, in Guy Mannering, to give justice embodiment in a justice of the peace.

To this head we would also refer the disingenuous use of *pseudo-synonymes*—that is, terms corresponding generally, but not alike expressive of the required shade of distinction. To *murder*, and to *put to death*, both indicate agency with a similar result; but the former phrase determines that agency to be criminal, while the latter affixes no such character to it. Many, under the impression that the terms are perfectly equivalent and interchangeable, might be induced to ascribe to *sour* substances the recognised properties of *bitter*. It is unnecessary to multiply examples.

Let us now review briefly the more frequent and more dangerous species of fallacies which we have ventured to denominate *extra-syllogistic*. The fault here was described as attaching, not to the expressed process of argument, but to the concomitant process of thought.

Sophisms, ranging under this general category, are all traceable to two sources, the first of which is the *assumption of doubtful premises*. This error appears in a great variety of forms.

Accidental coincidence is often assumed as sufficient to establish efficient connexion. Two events happen nearly at the same time; therefore one is supposed the cause, and the other the effect. Of this sort of false reasoning, we remember a notable instance in Prideaux. Cambyses was mortally wounded by his sword piercing his body in the same part in which he had stabbed the sacred bull of the Egyptians. In narrating this incident, the dean expresses his concurrence in their superstitious inference, observing that the mode of the king's death was probably designed to mark the divine displeasure against his act of violence, as an insult offered to the cause of religion in general. On the same error are based the fictions of astrology. The fate of individuals and of nations has been thought to be bound up in the movements and conjunctions of the stars; and so simple an event as the appearance of a comet has ere now frightened Europe into penitence. Virgil, in his first Georgic, bids the farmer confide in those indications of the weather afforded by the aspect of the sun, since that luminary's obscuration gave faithful warning of the impending doom of Cæsar. On the same principle, the decline of the Roman power was early ascribed to the spread of Christianity. All our popular superstitions are to be similarly explained; those, for instance, which interpret as infallible preludes of death or discord, the chirping of an insect, the howling of a dog, or the spilling of a little salt.

Closely allied to the preceding fallacy is that which consists in the *assumption of a hypothetical cause*. At this stumbling-block we find the father of logic himself tripping. "All the heavenly bodies," says Aristotle, in his Physics, "must move in circles, because a circle is the most perfect of all figures." The reason here assigned for a position, now known to be at variance with existing phenomena, is neither appreciable in itself nor applicable to the question. Des Cartes's hypothesis of animal spirits, and Hartley's theory of vibrations, both framed to explain the transmission of sensible impressions from the extremity of the nerves to the brain, are both referable to the same source of error—the supposition, namely, that when a *possible* cause has been assigned, the *real* cause has been discovered.

What is true with limitations, is frequently assumed to be true absolutely. Thus—"Deleterious drugs are always to be rejected; opium is a deleterious drug; therefore opium is always to be rejected." It is plain, that a maxim which holds good, generally, of persons in health, is not applicable, specially, to cases of disease. This sophism appears, perhaps, more frequently in the interrogative than in the categorical form. The object of the disingenuous disputant, then, is to extort from his adversary an unconditional answer to a question so put as to require it to be qualified. When the query is advanced in a bold, triumphant tone, with its real complexity dexterously disguised, a timid and inexperienced debater will be easily silenced by this expedient. The question, for example, "Is war detestable, or is it not?" cannot be answered directly and unconditionally. If we choose the affirmative, we concede the criminality of even defensive war; if we prefer the negative, we are dealt with as the advocates of aggressive. We must explain and qualify, if we would avoid either horn of the dilemma, at the risk, indeed, of being accused by our opponent of a wish to shuffle and prevaricate, and perplex the discussion. To this head most cases of defective parallel may conveniently be referred.

Again: *We may assume as exhaustive of all the alternatives of a given case what embraces only a portion of them.* Thus, in one of Lucian's Dialogues of the Dead, Menippus chooses to take for granted that the misery of Tantalus only arises from fear that he may *die* of thirst; and proceeds, accordingly, in sarcastic vein, to prove the apprehension groundless. "You say you are punished with thirst; but why is that dreadful to you? For I see no region besides this Hades, nor any second death in another quarter." Thus, too, the celebrated sophistical puzzle respecting motion. "Whatever body is in motion must move either in the place where it is, or in some place where it is not; neither of these alternatives is possible: therefore there is no such thing as motion." Here it is assumed, that there is no such third alternative as is conveyed by the prepositions *from* and *to*, the others involving manifestly a contradiction in terms.

Next may be mentioned the error of assuming that what is true of a whole, is true of a part. Critics, on this principle, have conceived themselves bound to vindicate, or puff into beauties, even the most flagrant faults of standard writers; and have seldom struck the medium between unqualified censure and extravagant praise. How often are meritorious individuals subjected to the odium, attaching, perhaps justly, to the majority of a class to which they chance to belong! How often are salutary institutions and customs neglected or decried, just because they have a common origin with others that are noxious and blameworthy! To reverse the illustration: How often are particular periods characterised as enlightened and prosperous, simply from a partial survey of the aspect of affairs! Take the era of Elizabeth. "There was, perhaps, a learned and vigorous monarch, and there were Cecils and Walsinghams, and Shakspeares and Spensers, and Sidneys and Raleighs, with

many other powerful thinkers and actors, to render it the proudest age of our national glory. And we thoughtlessly admit on our imagination this splendid exhibition as in some measure involving or implying the *collective state of the people* in that age."* And how much pernicious error has, in like manner, resulted from admitting the impression that every wise man has been always wise, every great man always great, and every good man always good.

Next falls to be noticed *the assuming of premises as the basis of a conclusion really identical with it, or the employing of two propositions alternately, the one to prove the other.* This is called reasoning in a circle. Thus, "some mechanicians attempt to prove (what they ought to lay down as a probable but doubtful hypothesis) that every particle of matter gravitates equally; 'why?' because those bodies which contain more particles ever gravitate more strongly, that is, are heavier. 'But (it may be urged), those which are heaviest are not always more bulky.' 'No; but still they contain more particles, though more closely condensed.' 'How do you know that?' 'Because they are heavier.' 'How does that prove it?' 'Because *all particles of matter gravitating equally*, that mass which is specifically the heavier must needs have the more of them in the same space;'"† which first is just the point for which proof is demanded.

Once more: *It may be assumed that a position must be false because of certain consequences supposed to follow from it.* These consequences may not follow. The truth of Galileo's astronomical theory did not infer the falsehood of the Scriptures, but merely the falsehood of the received interpretation of them. Or they may follow, and the position still be tenable. To have alleged that Galileo's theory was inconsistent with the Ptolemaic system of the universe, would have been true, but nugatory.

To the same head we may refer the *argumentum ad hominem*, or reasoning addressed to individual opinions, circumstances, &c., when unfairly employed; and all similar appeals to the prejudices and passions.

The above is not offered as a complete list of all the cases which we think resolvable into the fallacy of assumption, but merely as an index to its more common varieties. An adroit sophist will sometimes, without recourse to any other disguise than that of well-feigned perplexity, palm upon us, wholly unsuspicious of deception, a statement which, but for this artifice, had been the first to be tested. Perhaps the most memorable example on record of this species of legerdemain is that of the inquiry addressed by some wag to the Royal Society. That body was required to assign the reason why a vessel of water became no heavier by the mergement of a live fish; and, instead of proceeding to ascertain the reality of the alleged fact, the members betook themselves to the hopeless task of inventing hypotheses to account for it.

The fallacy of *irrelevant conclusion* appears in two shapes.

First, A position may be proved *altogether different from that which ought to be established*, although the sophist designs it to be mistaken for the other. Thus Horne Tooke, in the Diversions of Purley, would have us infer the falsity of our common notions respecting the first principles of morals, by showing that the terms *right, just, true*, only point, if their etymology be consulted, to what is *ordered, commanded, trowed*. But to prove this is by no means tantamount to proving that there are no such things as immutable morality and eternal truth. Byron is reported to have said, that "he had met with so many whose conduct differed from the principles they professed, and who seemed to profess those principles either because they were paid to do so, or from some other motive which an intimate acquaintance with their character would enable one to detect, that altogether he had seen few, if any, whom he could rely upon as truly and conscientiously believing the Scriptures.‡ Was not this conclusion intended to be taken as equivalent to another—namely, that there *were* few persons in the world sincerely entertaining these convictions?

Secondly, The proof of *part* of a position may be substituted for proof of the *whole*. Thus, if an insufficient argument, accompanied by several valid ones, be detached from the rest, and refuted singly, the sophist may plausibly insinuate that he has done enough to destroy the entire body of evidence. Or, again, to prove that certain inconveniences attach to a particular system, or that certain defects adhere to a particular institution, may with many minds pass as equivalent to the position that the system should be abandoned and the institution abolished. Instances of such artifices must occur readily to every one.

On the advantages of systematic acquaintance with the various modes of false reasoning, it is not our purpose to dilate. While rules on this head may to some be useless, and to others perhaps superfluous; while dullness may often fail to grasp, and genius sometimes dart ahead of them—

> "Seizing each point by native force of mind,
> While puzzled Logic blunders far behind"—

to the medium order of spirits, at least, if thoroughly studied and habitually applied, they will infallibly prove of essential service. To the speciosities of error every man is occasionally exposed; and he will usually find it his wisdom to provide himself with the means of detecting and disarming them.

OCCASIONAL NOTES.

TIME FOR PAYING WAGES.

THE paying of wages to working men is a very simple matter, yet it is seldom properly performed. The custom is for the employer to keep the money in his hands till late on Saturday evening, and then pay it over to his men. A monstrous injustice is perpetrated by detaining wages in this manner till the very close of the last day of the week. On Saturday night all the regular markets are terminated, and workmen and their wives are therefore either compelled to put up with the leavings of all the rest of the community, or to buy from a class of shops in which articles are dearer than in those of a first-rate order. For our part, we cannot see why an operative should not have it in his power to lay out his income of twenty shillings weekly, with as much mercantile advantage as any gentleman who lays out ten times the sum. Just let any person, in easy circumstances, fancy the idea of postponing his weekly supplies of food, and other articles in common use, till seven or eight o'clock on the Saturday night, and then sallying forth among all sorts of mean establishments, picking up goods, at not only an advance on regular prices, but generally of an inferior quality. And yet the practice of paying wages on Saturday evenings dooms thousands of families to this comfortless and thriftless mode of procedure. We repeat, it is fraught with injustice, and should at once be every where abolished.

But the practice is attended with worse results. It has a decided tendency to demoralise, and is now, in point of fact, demoralising no small portion of the working-classes. Saturday night brings with it a certain holiday humour. No work is to be done on the morrow, and we may give ourselves up to a little recreation. This recreation, it is almost unnecessary to say, takes too frequently the form of drinking exhilarating beverages—in short, from less to more, the man, forgetful of home and its demands, gets tipsy. The result is well known. The condition of some of our large towns on Saturday night and Sunday morning is fearful. Mr Alison, sheriff of Lanarkshire, says, in one of his works, that in Glasgow "from ten to twenty thousand workmen are more or less intoxicated every Saturday, and for most part of Sunday." Think of a town with ten thousand men drunk in it at one time. Against the demoralisation produced by this state of things, the most ingeniously contrived schemes, for the benefit of the lower orders, can scarcely make head. Yet it is worth while making an effort. We are far from saying that the payment of wages on Friday would produce sobriety, but we feel assured it would contribute largely to that result; for the obligation to return to work on Saturday would lessen the desire to go astray, and a habit of refraining from indulgence, on receiving wages, would have its due weight in improving the general habits of the individual.

Little more need be said on this not unimportant subject. The conductors of the present sheet have long followed the practice of paying all who are in their employment on Friday afternoon, and, as they believe, with benefit to the persons concerned. We should be glad to find the same plan generally followed; and, in particular, recommend the subject to the consideration of all societies designed to promote temperance and social order.

MUSICAL EDUCATION FOR THE PEOPLE.

The beneficial effects of music in allaying bad passions and eliciting the better attributes of the human mind, have been long acknowledged. If it be an exaggeration to say that it "hath charms to soothe the savage breast, to soften rocks, and bend the knotted oak," at least it is admitted to have a genial influence upon our nature. It remained for the present age to bring into practice the theory of instructing the masses in this delightful science. Formerly, the study of it was confined to the rich, the educated, and those who cultivated it for their daily bread; but within a recent period an attempt was made by Joseph Mainzer, an enlightened German, to inspire the working-classes on the Continent, and the people generally, with a taste for singing. He was so successful at Paris, that he had numerous classes of labouring men, who, after a short period, were able to sing in harmony with great power and precision.

Within the past year, M. Mainzer came to England, and, by dint of perseverance, aided by genius and industry, he has succeeded in establishing classes for the instruction of labouring men in singing. There are now daily classes in London; and it augurs favourably of the good sense and intelligence of the people, to be able to say that they have joined these classes in great numbers, and in a short time have made very rapid progress in the first principles of harmony. About a month ago, there was a gathering of all the classes at the Music-Hall, Stone Street, Bedford Square, and the efficiency exhibited by the pupils gave great satisfaction to a number of musical and literary *celebrités*, who were specially invited to be witnesses of M. Mainzer's success in developing and forwarding the musical capabilities of the multitude. The number of singers was nearly twelve hundred. They executed the national anthem with great precision and effect; and, indeed, upon few occasions has such a powerful and well-organised chorus been brought together. Although some of the pupils had not received more than two months' instruction, yet difficult pieces of music were admirably executed by them.

A system by which uncultivated men may sing beautifully in chorus, although three months before they did not know a single note, must naturally excite some attention, and we think that a brief explanation of the mode adopted by M. Mainzer must prove of interest to our readers. As soon as the elementary course is finished, a second or superior class is immediately formed, so as to conduct the pupils to the higher branches of the science. The first course consists of fifteen lessons, at the end of which the pupils can sing choruses in a very creditable manner. They manifest great energy and enthusiasm. Many of them will teach their companions so far as they themselves have proceeded, and then bring them to the classes. One person, a woman, comes thirty miles every week to receive a lesson. Many of the pupils attend two or three classes in the course of the week. One workman, in particular, attends a class every night. Six nights in the week does this industrious individual come to the various class-rooms, distant four, five, and six miles from each other. By way of proof of the estimation in which M. Mainzer is held by his pupils, we may mention that he frequently receives addresses of thanks, letters, and complimentary poetry from them, which, if not exhibiting much literary ability, yet manifest much honest gratification and gratitude. The manual employed by M. Mainzer for the instruction of his pupils, is a book of his own, called *Singing for the Million*, the lessons of which are on an easy and progressive scale, by means of which the study is much simplified. Within a recent period, a small publication has been established, under the auspices of M. Mainzer, called the *National Circular*, the object of which is to record the progress of his system, and its effects upon his pupils.

From the very commencement of M. Mainzer's labours, there seems to have been a due appreciation of the value of his system. For instance, at the Mechanics' Institution, the following was the ratio of the increase of his pupils. On the first evening, the number was 120; on the second, 250; on the third, 350; on the fourth, 400; and we are happy to say that the number continues progressively to increase.

The intention of M. Mainzer is to give periodical festivals, where the classes will assemble in the same manner as upon the occasion alluded to in Stone Street. The progress of the working-classes in musical education will there be fairly and fully developed. It is almost impossible to conceive how much good will be effected by giving to the artisan such ennobling pleasures, instead of the degrading ones to which, in too many instances, he now has recourse. The absence of musical taste, and an ignorance of the solid pleasure and improvement to be derived from the cultivation of the science, have long been a reproach to England, enlightened as she is. M. Mainzer, however, seems destined to remove this blot from our intellectual reputation.

M. Mainzer has already established a class at Brighton, and it is his intention to do the same in other provincial towns. At Brighton, he has been quite as successful as in the metropolis. His classes at Brighton increase in numbers, and the journals of that town attest the fact of the rapid progress of his pupils in the art of singing. Six hundred persons of all ranks, from humble mechanics to exalted fashionables, attended his very first lecture. It is not our intention at present to enter at length upon the doctrine which M. Mainzer professes; but we may remark, that his theory is shortly this. He contends that Nature has not only given to every human being a voice, but that each individual, if he cultivate that voice properly (and it may be done with ease), may become a good singer. It is true that some people have a finer voice than others, but he maintains that all may improve their voice, and acquire what is called an ear for music, by practice. The faculty of voice is, as he contends, susceptible of a higher or lower degree of development, by means of more or less practice. The truth of this theory has been demonstrated to a great extent by the progress which M. Mainzer's pupils have made. But to return to M. Mainzer's labours at Brighton.

He explained, at one of his lectures in that town, that all persons could make one tone, and this was *sol* (G in the treble clef), and this he called the speaking note. He made his pupils sing this note five times in a bar. They then rose one tone, to *la* (A, treble clef); after exercising them, they proceeded to *si* (B, the major third), and so to *do* (C, the fourth). They were then exercised in the scale downwards, and they effected all his lessons with great ease. M. Mainzer then illustrated the use of *time*, which he did in a peculiar mode. He does not use the old terms of breve, semibreve, crotchets, &c., but calls them *whole* notes, *half* notes, *quarter* notes, &c.

We have thus given an outline of M. Mainzer's system, the chief point of which is the attempt to teach persons to sing scientifically from notes, with as much ease as they are taught to read. His system is addressed principally to the humbler classes, from the excessive cheapness of the terms, which do not exceed the sum of three-halfpence per lesson.

Into the difficult question of the capability of the human voice, we do not propose to enter; contenting ourselves with repeating the principle for which M. Mainzer contends, that the register or compass of every one's voice may, by care, attention, and perseverance, be so regulated or improved as to enable all to sing with a certain degree of proficiency. Singing is certainly a beautiful accomplishment; and if, as M. Mainzer says, there is no nation on the Continent where the people possess such fine musical voices as he meets with among the workmen in England, it is not too much to anticipate that he will not be deceived in his desire to found a popular school of music, which may lead to the extensive dissemination of a taste for music among the labouring population of this country.

A FEW WEEKS ON THE CONTINENT.

BADEN-EN-SUISSE TO ZURICH.

THIS was a short journey. A forenoon's ride from the baths of Baden, by a road pursuing the left bank of the Limmat, brought us to Zurich. A part of the country through which we passed still belonged to the canton of Argau, which, occupying a situation between Basle and Zurich, is distinguished chiefly for its agriculture and the abundance of its fruits and vegetables. The slips of level in the valley of the Limmat were under active processes of husbandry; farm-establishments and cottages were here and there passed; and the eye, glancing upwards, travelled over sloping hill-sides covered to the top with the richest verdure, and dotted over with green bushy trees. Pleased as we were with the various evidences of rural prosperity, our feelings were ever and anon jarred on seeing the utter slovenliness of affairs about the farm-houses and villages, indicating at least an ignorance of the value of some of the best kinds of manures. As in Alsace, the cows were the chief beasts of draught, and women were everywhere engaged in the most degrading labour in the fields. The ladies of our party were full of lamentations on this subject, and their feelings were altogether overcome on seeing two aged female labourers come from an adjoining field, and soak at a pump a lump of brown bread, which they sat down and ate by the wayside.

The mean condition remarked in the exclusively agricultural or pastoral districts, disappears as we approach the large towns, where some kind of manufacturing industry introduces a degree of wealth and substantial comfort among all classes of the people. This is particularly observable in approaching Zurich. The beautiful slopes become sprinkled with detached cottages and houses, whitewashed and tastefully ornamented; and, with the numerous bushy enclosures and fruit-trees, the whole district seems a garden or orchard. At noon, we arrived at the environs of the town, and in a few minutes afterwards were established at a house of enormous size, the Hotel Bauer, opposite a suite of splendid new buildings, in which are contained the post and diligence offices. Zurich has a very different appearance from Basle. It is situated on nearly level ground, at the northern extremity of the lake of the same name, the chief issue of water from which being the Limmat, already spoken of, and which, a broad heavy stream, flows through the centre of the town. The Sihl, a lesser stream, from an adjacent hilly group, passes along the side of the town, at the entrance from Basle, and soon after joins the Limmat. Until a few years ago, the place was surrounded by walls, and being therefore prevented from expanding, the streets were densely clustered together, and built without any regard to regularity. At the period of our visit, an entire change had taken place in this respect. The walls had been demolished and swept away; some open pleasure-grounds and promenades had been established on their site; new streets of elegant buildings were opening up; and the environs, in all directions, particularly along the face of the neighbouring green hills, were in the course of being gradually studded over with the mansions of the higher class of citizens. Zurich is thus quite in a state of transition; old clumsy edifices are making way for handsome new erections, and the confined thoroughfares along the margin of the lake are widening and giving room for ranges of substantial broad quays, like those of a seaport town.

No small degree of good taste has been manifested in executing a number of these necessary reforms. The new streets are broad and well paved, open spaces have been reserved for public convenience, and an old rampart, at the entrance to the town, near our hotel, we found to be laid out as a flower-garden, from the summit of which is obtained a commanding view of the broad sheet of lake stretching ten or twelve miles southward, between beautifully wooded and cottage-clad hills, and bounded by the alpine heights of Glarus. Favoured by weather of superlative beauty, and surrounded by objects of the deepest interest, the time we spent here was employed to the best possible advantage. Some of my inquiries were of a nature which required me to pursue them alone; but the ladies, though left behind, had ample means of amusement in examining the various articles of Swiss produce in the shops; and if disinclined to go out, they could ascend to the flat roof of the hotel, and there, as on a terrace, obtain the most splendid views of the lake and surrounding country. A knowledge that such a place as this was at the command of visiters, was gained from a printed placard affixed to the back of our bed-room doors; and as this *affiche* was something curious in its way, we took the liberty of copying it. Here it is: "Zurich—capital of the canton, the oldest and most important manufacturing town of Switzerland, distinguished above all others for prosperous industry and natural situation, may by reason be called the most agreeable stay. Nowhere we find a more healthsome state of atmosphere than here, and scarcely travellers will find in no place of Switzerland more diversion. Without trouble, inconveniency, or danger, they enjoy on every points the most delightful view upon the lake and the chain of the Alps. But also the internal part of the town offers many interesting things, and, finally, a quantity of industrial, medical, and instructive establishments. The new builded hospital, the building for blinds, and deafs, and dumbs, are very beautiful, and deserve to be seen. Travellers having no time to see the already named points of view, will indemnify themselves for the loss by visiting the Belvedere of the hotel, which likes a walk (containing 300 feet in the length, and 16 in the broad); nothing can be more delightful than this view. On this Belvedere of the hotel travellers find every comfort for refreshment, dejeuners, tea in the evening; every thing is wound up by means of a mechanism." Not a bad specimen of English, it will be allowed, for a Swiss. If the reader ever goes to Zurich, we recommend him to fix his residence in this new establishment, which excels in cleanliness, airiness, and comfort.

By the kindness of a friend in England, I was favoured with an introduction to Mr Escher, junior, partner with his father in one of the largest, if not the very largest, engineering establishments in Switzerland. This concern is situated at about half a mile from the centre of the town, on the right bank of the Limmat, the large body of water of that beautiful river—equal in volume, I should think, to the Tweed at Kelso—being the agent of moving force to the machinery. The establishment is not contained in one but a number of houses, of different sizes, suitable to the nature of the work, and is more like a little town than a single factory. At the period of my visit, it gave employment to 800 men, the greater part of whom were Germans and Swiss, with some English—the whole superintended by Mr Lloyd, an Englishman, with whom I had some conversation. Conducted over the whole of the works, I found every thing on a scale resembling that of the most effective engine factories of Manchester or Leeds. First, we were shown the enormous water-wheels by which all the interior mechanism is moved; and then, one after the other, were shown the foundry for iron and brass—the large hall in which planing machines are smoothing the surfaces of huge masses of iron or turning cylinders—the various floors on which are being made every kind of apparatus for spinning flax, silk, or cotton—a place in which the scattered parts are assembled and put together—and, lastly, the warehouse, in which a number of men are busy packing the machinery for distant parts of Switzerland and neighbouring countries. The Messrs Escher, I was informed, furnish machines for factories in Austria, the north of Italy, and northern Germany; and, as far as I am able to judge, the mechanism in preparation was as strong and tastefully finished as any thing of the kind turned out from our English factories. It required but a glance at such a concern to feel that the days of English supremacy in manufacturing industry were fast melting away. Machines, of every description, can here be made, of, in some cases, a superior structure to what can be executed in England; for, here, the maker is fettered by no patent privileges, and he can therefore combine improvements which no individual English manufacturer dare attempt to unite.

This is only one of many manufacturing establishments in and about Zurich. The canton takes the lead in Swiss manufactures; its principal article is silk goods, the raw material being imported with little trouble from Italy, and here spun, dyed, and woven into various kinds of tissues. A few years ago, there were 853 manufactories in the canton, of which 128 were spinning-mills, 7 calenders, 3 card manufactories, 2 thread mills, and 8 engineering works. The weaving of silk is entirely in the hands of hand-loom weavers, of whom there are supposed to be 12,000 or 13,000 in constant employment, mostly within a few miles of Zurich. It is proper here to mention a distinct peculiarity of this class of operatives in Switzerland. They do not huddle up into mean dwellings in towns, but disperse themselves over a certain district of country, in separate cottages, each cottage being provided with a garden and small piece of ground, on which the industry of the man and his family is exerted. The diligence with which the families of Swiss workmen pursue their labours in and out of doors at these rural retreats, is spoken of by all travellers as a kind of wonder, and in the neighbourhood of Zurich it appears in its most captivating form. Passing along the western bank of the lake, and wandering up the slopes of the Albis, we perceive numerous clusters of cottages, inhabited principally by weavers, from which the sounds of the shuttle are heard to proceed. Here, as elsewhere, the cottages are chiefly of wood, but substantial, and are generally ornamented with vines climbing to the pendant eaves of the roof. All around are patches of garden, or small enclosed fields, sufficient, probably, to pasture a goat, with some ground under crops of potatoes. It is evident that the subsistence of the inhabitants is derived from a union of agricultural with manufacturing pursuits. If the husband is at the loom, his wife is out of doors at the potato ridges, a girl is winding bobbins, and a boy is attending the goat; baby leads the only sinecure life, and is seen sprawling at his ease on a cushion laid on the ground at a short distance from the mother. The keeping of pigs is also an almost universal practice. It may be asked, what is the amount of wages realised weekly? From all I have been able to learn, the wages of a silk or ribbon weaver are seldom above 6s. per week, and frequently not more than 4s. 6d. Cheap as most articles are, it would be impossible to make such a sum serve for a family, unless great frugality were employed, and a part of the subsistence drawn from the garden, the field, the pig, and the goat. Estimating this branch of the workman's revenue at 3s., the entire earnings cannot be made more than 9s. weekly; and for this, all the members of the family, baby excepted, give their labour. I had heard so much of the comforts of the Swiss operative manufacturers, particularly the weavers, that I was most solicitous to ascertain in what respect their opportunities of well-doing differed from those of our workmen in England. After making all proper allowances, it appeared to me that the contrast between the mass of British operatives and that of the Swiss, is very much the same as we might institute between the British working man of the present day and the British working man of a century ago. The time has been with us when the bulk of the people lived in a more simple fashion than they now do — enjoyed no luxuries, wrought hard, lived frugally, made every thing tell and lost nothing, eking out the ostensible gains of industry with the profits of a garden or a cow, and so forth. The small farmer in Scotland, seventy years ago, mended his plough-harness or his own shoes in the evenings, sitting by the winter fire, his wife spinning by his side. There was in this system a certain homely comfort; there was simplicity and content: the moral state of a community in such circumstances, if it included few brilliant virtues, was free from gross vices, and habits generative of poverty. How far it has been well exchanged for higher wages with higher desires and a life spent in less pure and simple circumstances, I will not take it upon me to say; but such a state, I conceive, is that of the Swiss workman of the present day. He realises small wages; but he employs his spare hours in making his own and his family's clothes, and his wife and children are all productive in some humble way, so that, being frugal and easily contented, the family never are ill off. The difference, then, depends very much on merely moral conditions. In Scotland alone, it is calculated that above L.4,000,000 per annum are spent on whisky—a source, not of comfort, but of moral degradation. The bulk of the community of the country are poorer by this sum year by year. Now, I question if L.100,000 are spent on exhilarating liquors annually amongst the equal population of Switzerland.

The whole political condition of Switzerland is cast in the same simple mould as the condition of a single family. Its twenty-two cantons unite in a republican government, which is cheaply, and upon the whole smoothly, conducted, studying in all things the express and immediate benefit of the whole people. The taxes are light, and there is no exalted class to produce a constant straining after imaginary happiness amongst those below. The government follows the principles of free trade. It has no customhouse establishment, either in reference to the general frontiers or the frontiers of the respective states; the only impediment to the transport of goods of any description, in any direction, is the exaction of tolls, at the rate of about one penny per hundredweight, for the benefit of the cantonal revenues, from which, however, the roads are kept in repair. At all the great outlets from Switzerland, strong bodies of *douaniers*, or armed customhouse officers, are stationed by the authorities of other nations, for the purpose of rigorously examining and taxing all articles that come out of the Swiss territory; but within the Swiss side of these outlets there are no officials to pay the least attention to any thing that comes into the country; and, in point of fact, the French, Germans, and other neighbours, export to Switzerland whatever goods they please, including all kinds of foreign produce, without being charged any duty whatever. This very remarkable state of things is partly ascribable to the contending interests of the different cantons. Some cantons are agricultural, and others contain large seats of manufacture. But the agricultural cantons would feel it very hard to be obliged to buy manufactured goods from a neighbouring canton at a dearer rate than they could buy them from somewhere abroad; the peasantry of Vaud have no idea of emptying their pockets to benefit the manufacturers of Basle or Zurich. Another cause, perhaps, is the vast expense which would be necessarily incurred by attempting to watch a widely extended boundary beset by active contrabandists. It is at the same time but fair to state, that in all the deliberations of the Swiss authorities for a number of years, there appears to have been a great unanimity of feeling on the propriety of abstaining from restrictions on commerce. A committee appointed by the diet in 1833, to consider the subject of foreign relations, made the following report, one of the most extraordinary ever uttered by the members of a legislative body:—

"First—The Swiss confederation shall irrevocably adhere to its established system of free trade and ma-

nufacture. Second—Under no circumstances and no conditions shall it form a part of the French custom-house system, of the Prussian commercial league, or the customhouse line of any foreign nation. Third—It shall use every effort for the establishment and extension of the principles of free trade. Fourth—It shall, as far as possible, discuss and establish conventions with the neighbouring states for the disposal of agricultural and vineyard produce and cattle, for obtaining the free ingress of corn, and for maintaining the daily, reciprocal, economical, neighbourly, and border traffic and market transactions. Fifth—Wherever a free trade is not obtainable, it shall endeavour to remove all prohibitions, to lower duties, and to secure the power of transit on the most favourable terms. Sixth—When exceptional favours can be obtained, they shall be used for the advancement of those measures which lead to the accomplishment of the ends proposed; so, however, that exchanges be not thereby limited, nor personal liberty interfered with. Seventh—In the interior of Switzerland, it shall make every exertion to assist industry, and to remove impediments to intercourse, taking care, however, that it do not interfere with the personal concerns of merchants or manufacturers."

All restrictions on the importation of articles from other countries being thus removed, it might be supposed by some that the country would be deluged with foreign manufactures, greatly to the injury of native capitalists and workmen. But this does not appear to be the case. In several branches of manufacture the Swiss excel, and the opportunity of buying certain kinds of foreign produce, at a particularly cheap rate, enables the people to encourage the growth of other manufactures in their own country. The peasant who buys an English-made knife at half what he could buy a Swiss one for, has a half of his money remaining wherewith to purchase a native-made ribbon; hence, Swiss manufactures of one kind or other are sure to be encouraged. From all that I could either see or hear, my impression is, that the liberty to import foreign articles is of no sort of consequence to the native producers; the truth is, comparatively few foreign-made goods are seen, either in shops or on the persons of the people. The bulk of the Swiss, it would appear, clothe themselves in materials made by the hand in their own humble dwellings; and what they buy must be substantial and worth the money. English-printed calicoes are rarely seen, although they are much lower priced than those of Switzerland, because the people have no confidence in the durability of the colours. The Swiss goods of this class are not only beautiful, but strong and durable in colour—qualities now rarely found in the produce of English factories. There are articles called Swiss prints sold in England; but we were informed by a manufacturer at Zurich that he did not believe a single piece ever was sent to this country, the whole that were passed off as Swiss being mere counterfeits. I am unable to say with what degree of truth this allegation was made; but it is very certain that the growing trashiness of quality of most English tissues is excluding them from the only open market in Europe.

The manufacturing industry of Switzerland in some measure takes its tone from the distinctions of race in the population. The Germans engage in the manufacture of iron, linens, silk, cotton, pottery, and some kinds of toys; while the French, from their superior artistic tastes, employ themselves in making watches, jewellery, musical boxes, and other elegant objects. Iron of a superior quality is found in one of the cantons, and coal is also dug, but it is of stony quality, and wood forms the chief fuel. Salt is now made within the canton of Basle, and in the Valais. From the prevalence of rapid running streams, there is an abundance of water power in almost all quarters, and therefore little expense is incurred for forces to turn machinery.

When we consider that Switzerland has not a single sea-port, no foreign political connexion, no flag to protect its external interests, and can neither import nor export goods except by paying duties and tolls through one or other of the surrounding states, it seems surprising how such a country can carry on any foreign trade at all with advantage. The power possessed by their neighbours of laying tolls on the transit of goods to or from the Swiss frontiers, is certainly a serious drawback on the prosperity of the republic; and there cannot be a doubt that if France, Rhenish Germany, Austria, and Sardinia, were combining to ruin the trade of Switzerland, they could very easily do so. Hitherto, these surrounding countries have acted on the reasonable principle of competing against each other, in order to secure a share of the transit, and until the German league is drawn round this independent little country, there need be no fear of its being shut out from the field of general commerce. As the case is, it says much for the energy of the Swiss that they can bear up against a long land-carriage to and from sea-ports. No man can see unmoved the large waggons, drawn by six or eight horses, and loaded with bales of cotton, slowly toiling up the country from Mayence, to which the cotton has been brought by barges on the Rhine from Rotterdam, with the design of being carried to some remote manufactory in Zurich. There is a persevering enterprise in this that exceeds all ordinary conceptions of industry. But other difficulties have to be encountered. The expense of transport, when the raw material has reached the borders of the mountain country, is greatly increased. The roads are generally excellent, but some of the seats of manufacture are placed at the height of from two to three thousand feet above the level of the sea; and in certain districts the snow closes all communication for traffic from November till March. Great as are these complicated drawbacks, the Swiss manufacturers defy them, by dint, it appears to me, chiefly of two circumstances—first, cheapness of labour, which enables them to undersell the English every where in good articles, and to withstand competition from every other quarter; second, abundance of capital, stable social institutions, the absence of a class of mere speculators, and the presence of a sufficient number of skilful labourers. How far the freedom of trade directly operates, I cannot say; it must at least be a negative advantage. Yet the manufacturing prosperity of Switzerland, I am assured, depends immediately on the above circumstances, most of which, it will be observed, are connected with peculiarities in the national character—their frugality, prudence, skill, and general habits of life. The case may be said to be exactly that of one of those poor but frugal and industrious families amongst ourselves, who make a livelihood by keeping cows and selling the milk; and who, in consequence of all the family working at some part of the business, and being content with small gains and simple living, can (as has been proved by experience) successfully compete with milk companies, highly organised and conducted by enlightened but also highly paid functionaries.

I have learned, with some regret, that the seeds of change are considered to be already sown in the trafficking system of Switzerland. There is a party who conceive that the time must come when it will be impossible to maintain the Swiss manufactures in their present advantageous condition—foreseeing, probably, that workmen will become less easily contented, and that the simplicity and good faith of the whole system must give way; and this party are favourable to a union with the German league.

RECENT EXPERIMENTS AT MANCHESTER.

THERE have been some curious exhibitions at the Manchester Athenæum, to show that the phenomena of what is commonly called Animal Magnetism, or Mesmerism, can be produced by means quite independent of any external influence. Mr Braid, a surgeon, is the person who has brought forward this proposition, and endeavoured to prove it. His first exhibition, which took place on the 27th of November, was numerously attended. It appears that M. Lafontaine, the Belgian mesmerist, had been exhibiting at Manchester a week before, and had set Mr Braid's brain a-working on the subject. His knowledge of the organisation of the eye suggested to him a physiological cause for the phenomena; and he lost no time in proceeding to experiment, with a view to proving if such was the case. He considered his success so great, that he resolved to come before the public with his views.

At the meeting, five persons voluntarily submitted to this new kind of mesmerism. A small but distinct and conspicuous object being placed above the level of the eye, Mr Braid directed his subjects to regard it with a steady gaze: the stopper of a bottle was the first object which he employed; afterwards he bound a long cork upon their foreheads, in the manner of a horn, desiring them to fix their gaze upon its outer extremity. Generally, their eyes closed in about a minute, some in less, Mr Braid standing all the time at a considerable distance. In this condition, though retaining, apparently, their ordinary consciousness, they had no power to open their eyes; but Mr Braid enabled them to do so by merely a slight rubbing of the eyelids. In one instance, the patient remained unaffected, in consequence, Mr Braid alleged, of his being disturbed by noise, and not keeping his gaze steadily fixed. The phenomena do not appear on this evening to have been carried any farther. A discussion took place amongst the medical men present, some of whom were mesmerists; and it was the general opinion that some of the mesmeric conditions had been produced by Mr Braid's plan, but that some of the more wonderful were wanting. Mr Braid persisted in declaring that he considered the two classes of phenomena as identical.

A week after, he repeated his demonstrations in the same place, and on this occasion the wonders presented were of a somewhat more striking kind. He had, in the mean time, allowed some of the subjects of his experiments to remain a little longer in the unusual condition into which they had been brought. The consequence was a congestion of the brain, attended by an astonishing increase of sensibility, insomuch that they obeyed every slightly indicated wish of the operator, and could distinctly hear the faintest whisper. He had produced this cataleptiform state in forty cases, without a single failure. He now believed that persons might in such a condition see with their eyes shut, the excessive sensibility enabling the organ to act by means of the small quantity of light passing through the lids. On this occasion, he placed five persons on the platform, who, by looking at corks planted horn-wise on their foreheads, became affected in spaces of time varying from a quarter of a minute to three minutes. "All the five subjects," says the report, "were then placed in postures of the most singular and ludicrous character: the hands of some were uplifted as if praying; others held them forward as if blind, and seeking some one; and the remarkable ease with which every limb was raised and fixed in its position, was very striking."

Desirous to test how far the will of one of the subjects (a girl) could be exercised in obedience to his requests, Mr Braid desired her to rise. She did so, although apparently asleep and her eyes closed. He then, by gentle entreaties, induced her to walk along the platform, which she did, with those peculiar characteristics of caution and care which are described as displayed by somnambulists. This was altogether a very striking experiment—one which Mr Braid said he had never tried before that moment; he had, indeed, never seen this patient till two days ago. He then asked her to curtsy, which she did, and in a low voice answered several questions which he put to her. On being afterwards restored to her usual state, this girl said that she recollected walking and being asked questions, and felt as in a dream. She was afterwards mesmerised in the manner of M. Lafontaine, and in this state, though her eyes were closed, on being asked if she saw what Mr Braid had in his hand (it was a glass rod), answered "Yes;" and to the query "What is it?" answered "Glass." Another female, Mr Braid's cook, who was put into the cataleptiform state by gazing, on being pricked by a pin, manifested no sense of pain. Mr Braid ventured on this occasion to assert, with increased confidence, his opinion, that the effects of his experiments were identical with those of ordinary mesmerism; and the scepticism on this point, of those who tested his experiments, appeared to be considerably diminished. The girl who had been in both conditions, declared that she knew no difference in the sensations she experienced under them respectively. It seemed the general opinion, that the two classes of experiments, if not in all respects identical, were at least closely analogous. Mr Braid took occasion to warn his audience against carrying these experiments too far; as, amongst inexperienced persons, considerable danger might ensue. At the same time, it was worthy of remark, that a remedial effect had resulted from them in the case of an invalid young lady under his care—an effect which he had not expected, but which had determined him to prosecute the inquiry with a view to the benefit of mankind.

At a third exhibition, a few days after the second, a still greater number of persons were thrown into the cataleptiform state by following Mr Braid's directions. One of these, a Mr Cope, who had been mesmerised by M. Lafontaine, and had hitherto been incredulous as to Mr Braid's system, declared afterwards that in the two conditions he was conscious of no difference. No attempt was made to ascertain if Mr Braid's subjects possessed any portion of that power of seeing without the ordinary use of the sense which some of the mesmeric subjects have professed to have. But, certainly, in many of the phenomena, as they were felt by the subjects and witnessed by the spectators, a strong resemblance existed to those of mesmerism. It may still, of course, remain doubtful how far subjects affected in the Braid fashion are not in reality under the influence of that same magnetism which the mesmerists suppose to be the agent in their class of phenomena—as also how far the groups of people operated on in the Manchester Athenæum are not under some of those sympathetic passions which have produced such strange effects in other cases. It is proper, however, to state Mr Braid's own notion as to the physiological causes of both his own and Mesmer's phenomena. It is, briefly, that by an individual keeping up a steady gaze or fixed stare at an object placed in such a position as to put the greatest number of muscles connected with that organ and its appendages into action, the mind being at the same time necessarily abstracted, congestion takes place in the eye, and a rapid exhaustion of the natural sensibility of the retina and motive nerves of the eye and eyelids. This is reflected on the brain, and from that to the heart and lungs, producing enervation and consequent sinking in the force and frequency of the heart's action. These conditions lead to congestion of the brain, the proximate cause of the cataleptiform condition.

In connexion with the Manchester experiments, we may here introduce some extracts from a letter addressed to us, in consequence of a late paper on mesmerism, by a gentleman of our acquaintance, in whose credit-worthiness as a witness of facts we have all possible reason to place reliance:—"When in London last May, I was invited by a gentleman long known to me, Mr Townsend, to witness some mesmeric experiments at his own house. The subject was a young man, a Belgian, about nineteen years of age, named Egide Earts. Mr T. succeeded, in about ten minutes, in inducing the middle or somnambulous state, by merely holding the youth's hands and looking steadily in his face. A deep and thick bandage was then placed over the youth's eyes, and the persons present were invited to offer him words, either printed or written, to read. I gave him my own address card and that of a friend who was present; and placing them close to his forehead, with the printed side towards him, he pronounced the words of both with his foreign accent. I turned up in a French book a chapter bearing the odd titles of HUMILITE—MANSUETUDE—PARDON. He did not succeed in naming the two first words, although he said

there were three, and he said the third word was 'Pardon.' The number of the chapter, which was the 30th, expressed in Roman numerals, he said was "three X's." From his being evidently illiterate, I should think that he did not understand the import of these three letters. A lady was allowed to take off his bandage, and hold down his eyelids with her middle fingers; when he read whatever was presented him with equal ease, his hesitations being chiefly in those cases where the writing was not plain, or where the words were beyond the range of an illiterate mind. I requested and obtained leave to hold his eyes myself, that I might be perfectly satisfied that he could not possibly use them. For the complete sealing of his ordinary inlets of vision, I can pledge myself. Yet every thing that was presented to him he read with the same ease as before!"

Our correspondent goes on to say—"I happen to be acquainted with an English lady, who, after exhausting medical advice for a severe ailment of three years' duration, was cured, as she conceives, by a prescription from a person in the somnambulous state. She had lost health to such an extent, that she required to be wheeled about from place to place. Given up in England, she tried the Continent, but there experienced no benefit. After 'suffering many things of many physicians,' she was brought to Paris on her way home, still unable to walk. She was here advised to consult a medical man in whose house dwelt a mesmeric subject, a female, who, in the somnambulous state, professed to see internal organisation, and to prescribe appropriately for the diseased. The lady at first refused 'to make a fool of herself,' by having recourse to such an oracle; but at length was persuaded to go, though still half-ashamed and wholly incredulous. The doctor brought the *somnambule* into the room, and, having put her into the mesmeric sleep, desired her to describe the lady's state. She did so promptly and decidedly, distinguishing what was unsound from what was sound, and following up the recital by prescribing medicines and a regimen, which, she said, would take some time to show good results, but would ensure a perfect restoration to health.

The lady returned to England, followed punctually the prescription, began to mend, and, within the specified time, *was* restored to health and strength. This recital I have from one of her most intimate friends, and I have myself seen her in the restored state. Of course, it may be that she would have recovered independently of these circumstances; or it may be that the doctor only took a rather odd way of communicating a prescription which he thought suitable to the case. Still, I would say, there is sufficient unlikelihood in these surmises, to make it desirable that the professed powers of the *somnambule* should be carefully investigated.

The lady who gave me the above particulars is a believer in mesmerism—that is to say, she has seen a variety of phenomena, which she cannot account for otherwise than by supposing some peculiar action of the nervous system beyond what has hitherto been observed or imagined. In a letter with which she has favoured me, she makes some remarks, which, as they may be beneficial to the mesmerists, I subjoin. 'It has appeared to me,' she says, 'that the great and constantly recurring error of these gentlemen is, that they do not address themselves, as they ought to do, to the benevolent feelings of mankind, but, as they should *not* do, to their wonder. This, I am well assured, is the rock on which they split. Instead of keeping religiously in view that the object of all their operations should be directly and indirectly the relief of their fellow-men from physical suffering, they try to take the mind, senses, and consent of the spectators by storm, by the exhibition of, it is true, new and startling phenomena, but which are generally quite useless to those from whom they are elicited. Such exhibitions injure the cause it is intended they should advance, and moreover deprive us of means which, conscientiously used for the purpose of cure only, might spare the invalid much and acute suffering.'"

MR CATLIN ON AMERICA.

SECOND NOTICE.

THE work of Mr Catlin upon the American Indians, noticed already in the present work, gives us valuable sketches, from pen and pencil, not only of the human inhabitants, but also of the numerous classes of the lower animals, to be found in the inland wilds of North America. In the previous article, the wild horse of the Indians was alluded to. Mr Catlin, moreover, paints and describes the buffalo of the prairies, and gives several interesting accounts of buffalo hunts, which form the almost daily occupation of the aborigines on the Missouri and elsewhere. The buffalo is gregarious, ranging the prairies in numerous herds. It is of a dark brown colour, larger for the most part than the common domestic ox, and, in the cases of males, sometimes reaching the enormous weight of two thousand pounds. The shoulders of the male are of great breadth and depth, and a long shaggy mane hangs in profusion from the neck, often touching the ground. The horns are short but strong, and having but one slight curve, are most formidable butting weapons. In the female buffalo, the mane is shorter, and the shoulders less massive. Buffalo herds are found in America between the 30th and 55th degrees of north latitude, and from the verge of the western frontier of the States to the Pacific edge of the Rocky Mountains. These herds follow a leader, some bull which has earned the place of honour by victory in the numerous battles among the males. At particular seasons, these conflicts present a terrible sight, several thousands being occasionally seen engaged in one melée, in the midst of the clouds of dust which they have raised. Their conjoined bellowings add to the impressive nature of the scene.

Three hundred thousand Indians, Mr Catlin calculates, not only subsist wholly on the buffalo, but derive from it all the other necessaries, and even many of the luxuries, of life. "The robes of the animals are worn by the Indians instead of blankets; their skins, when tanned, are used as coverings for their lodges and for their beds; undressed, they are used for constructing canoes—for saddles, for bridles, l'arrêts, lassos, and thongs. The horns are shaped into ladles and spoons—the brains are used for dressing the skins—their bones are used for saddle-trees, for war-clubs, and scrapers for graining the robes—and others are broken up for the marrow-fat which is contained in them. Their sinews are used for strings and backs to their bows, for thread to string their beads and sew their dresses. The feet of the animals are boiled, with their hoofs, for the glue they contain, for fastening their arrow-points, and many other uses. The hair from the head and shoulders, which is long, is twisted and braided into halters, and the tail is used for a fly-brush. In this manner do these people convert and use the various parts of this useful animal; and with all these luxuries of life about them, and their numerous games, they are happy—God bless them!—in the ignorance of the disastrous fate that awaits them."

Even on foot, the Indians can, to a certain extent, make prize of the buffalo; and one mode of doing so is by covering their bodies with the skins of wolves, and creeping near the stragglers of the herds, armed with their bows. Though the animal may be torn down by a pack of wolves, it is not afraid of one or two of them, and Mr Catlin saw cases in which an old bull, whose retreat had been cut off, had singly resisted for several days the desperate attacks of a whole pack. The Indians, however, hunt the buffalo, most commonly, on horseback. The following is a sketch of a hunt among the Minatarees, who were mounted, and armed partly with bows and partly with lances. The buffaloes soon snuffed their foes, who had formed a circle round them, and they fled. "To the point where they were aiming to cross the line, the horsemen were seen at full speed gathering and forming in a column, brandishing their weapons and yelling in the most frightful manner, by which means they turned the black and rushing mass, which moved off in an opposite direction, where they were again met and foiled in a similar manner, and wheeled back in utter confusion; by which time the horsemen had closed in from all directions, forming a continuous line around them, whilst the poor affrighted animals were eddying about in a crowded and confused mass, hooking and climbing upon each other, when the work of death commenced.

In this grand turmoil, a cloud of dust was soon raised, which in part obscured the throng where the hunters were galloping their horses around, and driving the whizzing arrows, or the long lances, to the hearts of these noble animals; which, in many instances, becoming infuriated with deadly wounds in their sides, erected their shaggy manes over their blood-shot eyes, and furiously plunged forwards at the sides of their assailants' horses, sometimes goring them to death at a lounge, and putting their dismounted riders to flight for their lives; sometimes their dense crowd was opened, and the blinded horsemen, too intent on their prey amidst the cloud of dust, were hemmed and wedged in amidst the crowding beasts, over whose backs they were obliged to leap for security, leaving their horses to the fate that might await them in the results of this wild and desperate war. Many were the bulls that turned upon their assailants, and met them with desperate resistance; and many were the warriors who were dismounted, and saved themselves by the superior muscles of their legs; some, who were closely pursued by the bulls, wheeled suddenly around, and snatching the part of a buffalo robe from around their waists, threw it over the horns and the eyes of the infuriated beast, and darting by its side, drove the arrow or the lance to its heart. Others suddenly dashed off upon the prairies by the side of the affrighted animals which had escaped from the throng, and closely escorting them for a few rods, brought down their hearts' blood in streams, and their huge carcasses upon the green and enamelled turf.

In this way this grand hunt soon resolved itself into a desperate battle; and, in the space of fifteen minutes, resulted in the total destruction of the whole herd, which in all their strength and fury were doomed, like every beast and living thing else, to fall before the destroying hands of mighty man. I had sat in trembling silence upon my horse, and witnessed this extraordinary scene, which allowed not one of these animals to escape out of my sight. Many plunged off upon the prairie for a distance, but were overtaken and killed; and although I could not distinctly estimate the number that were slain, yet I am sure that some hundreds of these noble animals fell in this grand melée."

One other observation of Mr Catlin respecting buffaloes is well worthy of notice, as it may possibly throw light on the secret of taming horses by *whispering*, as the Irish call the process. Speaking of very young calf-buffaloes, Mr Catlin tells, that, when they are found apart from their dams, they push their noses into a bush a few inches high, and have the firm persuasion, poor things, that nobody can see them. When approached, they kick, but soon yield; and then "I have often (says our author), in concurrence with a known custom of the country, held my hands over the eyes of the calf, and breathed a few strong breaths into its nostrils; after which I have, with my hunting companions, rode several miles into our encampment, with the little prisoner busily following the heels of my horse the whole way, as closely and as affectionately as its instinct would attach it to the company of its dam. This is one of the most extraordinary things that I have met with in the habits of this wild country; and although I had often heard of it, and felt unable exactly to believe it, I am now willing to bear testimony to the fact, from the numerous instances which I have witnessed since I came into the country. During the time that I resided at this post, in the spring of the year, on my way up the river, I assisted (in numerous hunts of the buffalo, with the Fur Company's men) in bringing in, in the above manner, several of these little prisoners, which sometimes followed for five or six miles close to our horses' heels, and even into the Fur Company's fort, and into the stable where our horses were led. In this way, before I left for the head waters of the Missouri, I think we had collected about a dozen, which Mr Laidlaw was successfully raising with the aid of a good milch cow, and which were to be committed to the care of Mr Chouteau, to be transported, by the return of the steamer, to his extensive plantation in the vicinity of St Louis." This is really a very curious fact; and, as all the world is at present experimenting in order to unmystify mysteries, we strongly recommend that some one, conveniently circumstanced, should try the preceding process upon our domestic animals. Besides the unveiling of the secret of the *whisperers*, any one who has seen a calf-driver perspiring under the task of propelling his charge by alternate pushing, pulling, and kicking, will allow that a positive general good would be the result of success. Seriously, the acute sense of smell possessed by most animals, may lead to such effects being produced. Having once inhaled the breath of any one, the creature may track it upon the air, and follow what it remembers and knows.

The Honourable Mr Murray, and other recent travellers in America, have somewhat hastily denied to the Indians the credit of exhibiting unconquerable fortitude under suffering and torture. Mr Catlin's more extended experience made him even painfully aware that their long-standing reputation in this respect was merited to its utmost extent. In a village of the Mandans, he witnessed the ceremonies of torture which this tribe inflict upon themselves under the impression that, the greater endurance they thus show, the more they gain the favour of the Great Spirit. He saw numbers submit, without a shudder, to have large jagged knives passed below the strongest muscles of the chest and limbs, to have skewers inserted, and to be hung up for hours by ropes tied round these. Some ran races with similar skewers in their bodies, and large weights attached to them, which could not be removed without pulling them forcibly through, or allowing them to suppurate out. Some of the Indians first bore the hanging trial, and then ran the race; in addition to all which suffering, they crawled to a block, where the little finger of the left hand was struck off as a sacrifice to the Great Spirit. Meanwhile, the dignitaries of the tribe are looking on to judge of comparative merit in endurance, and by this trial the sufferer rises or falls as "a brave." Mr Catlin noticed that every great Mandan chief bore marks of having endured, even several times, these horrible ordeals, and some had even sacrificed the little fingers of both hands. Mr Catlin verifies his descriptions by the certificates of three other travellers present at the time. So that if the stoical endurance of pain be a virtue, these poor Indians assuredly possess it.

With a word on the curious burial ceremonies of the Mandan tribe, we must leave this fascinating work. "These people never bury the dead, but place the bodies on slight scaffolds, just above the reach of human hands, and out of the way of wolves and dogs; and they are there left to moulder and decay. Whenever a person dies in the Mandan village, and the customary honours and condolence are paid to his remains, and the body dressed in its best attire, painted, oiled, feasted, and supplied with bow and quiver, shield, pipe, and tobacco, knife, flint, and steel, and provisions enough to last him a few days on the journey which he is to perform, a fresh buffalo's skin, just taken from the animal's back, is wrapped round the body, and tightly bound and wound with thongs of raw hide from head to foot. Then other robes are soaked in water, till they are quite soft and elastic, which are also bandaged round the body in the same manner, and tied fast with thongs, which are wound with great care and exactness, so as to exclude the action of the air from all parts of the body.

There is then a separate scaffold erected for it, constructed of four upright posts, a little higher than human hands can reach; and on the tops of these are small poles passing round from one post to the others; across which lie a number of willow-rods just strong

enough to support the body, which is laid upon them on its back, with its feet carefully presented towards the rising sun. When the scaffolds, on which the bodies rest, decay and fall to the ground, the nearest relations having buried the rest of the bones, take the skulls, which are perfectly bleached and purified, and place them in circles of a hundred or more on the prairie, placed at equal distances apart (some eight or nine inches from each other), with the faces all looking to the centre; where they are religiously protected and preserved in their precise positions from year to year, as objects of religious and affectionate veneration.

There are several of these 'Golgothas,' or circles of twenty or thirty feet in diameter, and in the centre of each ring or circle is a little mound of three feet high, on which uniformly rests two buffalo skulls (a male and female); and in the centre of the little mound is erected a 'medicine pole,' about twenty feet high, supporting many curious articles of mystery and superstition, which they suppose have the power of guarding and protecting this sacred arrangement. Here, then, to this strange place do these people again resort, to evince their further affections for the dead—not in groans and lamentations, however, for several years have cured the anguish, but fond affections and endearments are here renewed, and conversations are here held and cherished with the dead.

Every one of these skulls is set upon a bunch of wild sage, which has been pulled and placed under it. The wife knows, by some mark or resemblance, the skull of her husband or her child, which lies in this group; and there seldom passes a day that she does not visit it, with a dish of the best cooked food that her wigwam affords, which she sets before the skull at night, and returns for the dish in the morning. As soon as it is discovered that the sage on which the skull rests is beginning to decay, the woman cuts a fresh bunch, and places the skull carefully upon it, removing that which was under it.

Independent of the above-named duties, which draw the women to this spot, they visit it from inclination, and linger upon it to hold converse and company with the dead. There is scarcely an hour in a pleasant day, but more or less of these women may be seen sitting or lying by the skull of their child or husband, talking to it in the most pleasant and endearing language that they can use (as they were wont to do in former days), and seemingly getting an answer back. It is not unfrequently the case that the woman brings her needle-work with her, spending the greater part of the day sitting by the side of the skull of her child, chatting incessantly with it, while she is embroidering or garnishing a pair of moccasins; and, perhaps, overcome with fatigue, falls asleep, with her arms encircled round it, forgetting herself for hours, after which she gathers up her things and returns to the village.

There is something exceedingly interesting and impressive in these scenes, which are so strikingly dissimilar, and yet within a few rods of each other; the one is the place where they pour forth the frantic anguish of their souls, and afterwards pay their visits to the other, to jest and gossip with the dead."

HOMELY SCOTTISH PICTURES.

The "Gaberlunzie's Wallet" is a title requiring some explanation to an English understanding: it is, literally, the Beggar's Budget. We find it applied to a publication recently commenced, in the form of "Charles O'Malley," but at half the price per number, and of which we have seen the first two detachments.* It consists of a narrative, the main purpose of which seems to be to give arrangement to a series of poems and brief prose sketches. The whole style of these is homely, but clever and decidedly original; nor is a strain of kindly pathos wanting—arguing, altogether, an author who is of nobody's school or set, but a man who has both the will and power to be his own standard. To fortify our recommendation of the work to public notice, we extract what we consider as two pictures of Scottish scenery and feeling, remarkable for truthfulness of representation, while breathing abundantly of the poetical element.

"Carnwath Muir, or the 'Lang Whang,' as that portion of it is called to which we have occasion more particularly to allude, is situated in the Upper Ward of Lanarkshire; and although our Scottish farmers, by dint of hard labour and persevering industry, have succeeded in driving cultivation to the very hill-tops in many parts of our naturally sterile country, and are daily making inroads in every direction on this ancient soil, and a few green crofts, with patches of corn, are to be seen rising here and there, still they form but a small proportion of this extensive morass, the greater part of which has lain undisturbed since the Flood, and, to the eye of a traveller, presents a very dreary and desolate appearance. Immense tracts of brown moorland stretch around you in every direction, adorned, it is true, with bright and beautiful heather, but affording scanty subsistence to the straggling sheep thinly scattered over its surface. Nothing in the shape of a human habitation is to be met with for miles; and, with the exception of the hollow sound of the little rill, stealing along through the soft velvet course in the bosom of the black moss under which it is hurried, the solitary cry of a plover on the distant hills, or the husky whirr of a blackcock as he brushes past you on the wing, there is nothing living or moving with which you can claim acquaintance or feel sympathy. Nevertheless, this district is not destitute of interest to an enthusiastic Scotsman. There are here and there to be seen clumps of trees and ruined gables, favouring the idea that at one period some of our feudal families may here have had their abode—a supposition strengthened by the fact, that many of the small farm-houses lying amidst the brown moors are dignified with high-sounding and characteristic Scotch names. As might be expected in such a secluded region, the people are primitive in their habits and simple in their manners; the men are robust, bony, and muscular; the women blooming, tall, and graceful. The small-farm system is here in full operation; the farmers and their servants, working and eating together, are upon the most familiar and intimate footing; and it is a very common occurrence for the herd to marry his employer's daughter. Whatever effects this free and friendly intercourse between the employer and employed might have in more artificial states of society, certain it is that, in this natural and unsophisticated mode of life, it is productive of the most beneficial results; labour is lightened by such cheering encouragement, and the servant is anxiously alive at all times to the interest of an employer who treats him as if he were his fellow, and whose family regard him as if he were one of themselves. This principle of mutual assistance being usually acted on, operates very beneficially among all the members of this widely scattered community. They have little intercourse with the world, and, shut up among themselves, they get through the most toilsome operations with comparative ease, assisting each other in ploughing, reaping, sowing, and draining, with the greatest readiness; and, in the words of one of their own songs, exclaiming,

> 'What though we're few upon the muir,
> We lo'e each other mair;
> And to the weary wandering puir,
> We've comfort aye to spare.'"

"THE SNAWY KIRKYARD.

A' nature lay dead, save the cauld whistlin blast,
That chill'd the bleak earth to the core, as it pass'd,
And heaved in high ridges the thick chokin drift,
That cam in wreathed swirls frae the white marl'd lift;
And winter's wild war wearied baith heart and ee,
As we warsled richt sair ower the drear muirland lea;
And our feet skyted back on the road freezing hard,
As we wended our way to the Snawy Kirkyard.

Oh! a' thing seem'd dead—even the skeleton trees
Were shivering like death, in the grasp of the breeze;
And the hills that in sunshine tower'd proudly on high,
Seem'd shrinking in fear frae the wrath-cover'd sky;
Nor birdie nor beast could the watery ee scan,
A' were cowerin in corners, save grief-laden man:
Though the heart may be broken, the best maun be spared,
To make up a wreath in the Snawy Kirkyard.

The wee Muirland Kirk, whaur the pure Word o' God,
Maks warm the cauld heart and maks light the lang road,
Whaur alang the brown footpaths, when summer blooms green,
The plaids, gowns, and bonnets, like wild-flowers were seen;
The sly hill-side yill-house, whaur lasses meet lads,
Whaur herds leave their collies, and lairds tie their yauds—
Kirk-bell and house-riggin the white drift has squared,
But there's ae yawnin grave in the Snawy Kirkyard.

When the coffin is shut, though the mourner may moan,
The dead winna keep, and we're calm when they're gone;
For the colourless cheek and the lustreless ee
Are a' fitting trophies of death's victory;
We shrink from the sound of the first dirling clod,
We long till the grave's cover'd up wi' the sod;
But skulls grinning ghastly, amang the green sward,
Grin ghastlier still in a Snawy Kirkyard.

Through a' the hale parish, nae elder was known,
That was likit by a' like my grandfather John;
Oh, drear was that day when we bore him awa',
Wi' his gowd stores of thought, and his haffits o' snaw;
And the strong and the feeble, the timid and brave,
Cam through the black storm, to lay him in his grave:
I was then a wee callant, rose-cheek'd and gowd-hair'd,
When I laid his auld pow in the Snawy Kirkyard.

Oh, weel do I mind, though its lang, lang sinsyne,
And the world since has cool'd this then warm heart o' mine;
Yet whiles, when I think on these times lang gane by,
Saft thoughts soothe my soul and sweet tears dim my eye.
I see the auld man, when he clapp'd my wee head,
While a sigh heaved his breast, for my faither lang dead;
He nursed me, he school'd me, how can I regard
But wi' warm gushing heart-tears, a Snawy Kirkyard?

Now age wi' his hoar-frost has crispit my pow,
And my locks, ance sae gowden, are silvery now;
And though I can boast neither station nor power,
I hae health for my portion, and truth for my dower;
For my hand hath been open, my heart hath been free,
To dry the moist tear-drops frae sorrow's dull ee;
And mony puir bodies my wallet hae shared—
'Twas my counsel frae him in the Snawy Kirkyard.

In his breast there was love, in his soul there was grace,
That could aye in frail nature some sma' virtue trace;
In soothing sad sorrow, in calming mad mirth,
His breath, like the south wind, strew'd balm on the earth;
And weary souls, laden wi' grief, aft were driven
To seek comfort frae him, wha aye led them to Heaven;
Oh! sweet were the seeds sown, and rich was the braird
That sprung frae that stock in the Snawy Kirkyard."

ANECDOTES OF THE HORSE.

"The horse knoweth his owner," and he knows much more. I verily believe he knows more than many of the two-legged animals who ride on horseback; and I am quite sure there is more of the spirit of Christianity in his practice than is to be found in many of the bipeds aforesaid. Let me give a few anecdotes of this beautiful and friendly animal. Of a two-horse team belonging to the Earl of ——, near Oxford, one was very vicious, the other quite the reverse. In the stall next to the gentle horse, stood one that was blind. In the morning, when the horses, about twenty of them, were turned out to pasture, this good-tempered creature constantly took his blind friend under his protection. When he strayed from his companions, his kind friend would run neighing after, and smell around him, and when recognised, they would walk side by side, until the blind friend was led to the best grass in the field. This horse was so exceedingly gentle, that he had incurred the character of being a coward, when only himself was concerned; but if any of them made an attack upon his blind friend, he would fly to the rescue with such fury, that not a horse in the field could stand against him. This singular instance of sagacity (I had almost said of disinterested humanity) may well put the whole fraternity of horse-jockeys to the blush. They, to be sure, will fight for a brother jockey, whether he is right or wrong; yet they expect him to fight for them on the first similar occasion; but this kind-hearted animal could anticipate no such reciprocity.

Some years ago, the servant of Mr Thomas Walker, of Manchester, England, going to water the carriage-horses at a stone trough which stood at one end of the Exchange, a dog, that was accustomed to lie in the stall with one of them, followed the horses as usual. On the way he was attacked by a large mastiff, and was in danger of being killed. The dog's favourite horse, seeing the critical situation of his friend, suddenly broke loose from the servant, ran to the spot where the dogs were fighting, and, with a violent kick, threw the mastiff from the other dog into a cooper's cellar opposite; and, having thus rescued his friendly companion, returned quietly with him to drink at the fountain.—*American newspaper.*

DUELLING IN THE REIGN OF GEORGE III.

Such was the frequent occurrence of duels in this long reign, that one hundred and seventy-two were fought (in which three hundred and forty-four persons were concerned); sixty-nine individuals were killed; in three of these fatal cases neither of the combatants survived; ninety-six of them were wounded—forty-eight of them desperately, and forty-eight slightly; while one hundred and seventy-nine escaped unhurt. From this statement it will be seen that rather more than one-fifth of the combatants lost their lives, and that nearly one-half received the bullets of their antagonists. It also appears that only eighteen trials took place; that six of the arraigned individuals were acquitted, seven found guilty of manslaughter, and three of murder, two of whom were executed, and eight imprisoned during different periods.

When the British army occupied the south of France, similar scenes were witnessed, but more especially at Bourdeaux, where the French officers came over for the sole purpose of insulting and fighting the English, who were in many instances absurd enough to meet their wishes. It is, however, gratifying to state, that the fortune of arms was generally in our favour. In one instance the French officers went to the little Theatre de la Galete, when a furious fray took place between them and several British officers; although the latter had no swords, the French drew theirs; but the British, breaking up chairs and tables, in a few minutes shivered their weapons, and knocked them down in every direction.

It is somewhat strange, but I was, in a great measure, the means of terminating these differences. Coming out of the theatre, I was assailed by a group of French officers; I calmly replied, that if I had given offence to any of them, I was ready to afford them satisfaction, and dilated on the absurdity of making a national war the subject of personal hostility, while I enlarged on the friendly feeling that had prevailed between our armies during the Peninsular war, and recalled to their recollection the many kind acts we had shown each other when prisoners and wounded. The officers not only listened to me with the greatest attention, but I was obliged to accompany them and sup with the party. The next morning there was not a French officer in the town. —*Dr Millengen's History of Duelling.*

THE CHINESE TAILOR.

Among the many whimsical anecdotes told of the peculiar habits of the Chinese, perhaps few will be considered more characteristic of their love of imitation than the following:—Towards the close of the last century, an officer of the *Pitt*, East Indiaman, when that ship lay off Canton, sent ashore to a native an order for a dozen pairs of trousers, to be made of the nankeen for which China has been so long famed. The Chinese artisan required a pattern—he could not make any thing without a pattern—so a pair of trousers were sent at his request, which pair had been mended with a patch and needlework on the knee. In due time the dozen pairs were sent on board, of a fabric of exceeding beauty for fineness and quality, but every pair bearing, like an heraldic badge, the obnoxious patch on the one knee, exactly copied stitch for stitch, in a style that reflected the highest credit on the mechanical skill of the workman, and for the difficult execution of which an extra charge was made upon the purse of the exasperated owner, who had no alternative but to bring home his bargain as a qualification for the Travellers' Club; for certainly among no kindred or people, living between this and China, could a similar achievement have been performed.—*From a newspaper.*

COWED ONES.

THE cowed and fearful are an extensive generation. There is some cowed person about almost every house. The figure, character, and mode of existence, are often very obscure. One sees them opening doors when servants are out of the way: sometimes they will peep into the parlour, and, seeing company, instantaneously retire, with a super-beg-pardon air: some dim vista running to the rearward may give a faint presentment of one of the order, in the act of cleaning cups or glasses clandestinely. But in general they are almost as little cognisable inmates of the establishment, as were those household spirits of old which worked by night, and took care never to be in the way when the family was stirring in the morning. As far as they are ever observed, a subdued look and lambent step mark the race. No visiter ever hears their name. An introduction would put them seriously about. There would be too much blaze and style about it for their taste. Like the fish which is only found in waters at the bottom of dark caves, they rejoice and thrive in obscurity; that is, as far as they can be said to rejoice or thrive at all. But their general aspect conveys the idea of their going through a constant penance for the sin of existence. They seem to know that they are superfluous, and their whole soul is directed to the expiation of the offence. Hence they can take no liberty of any kind with any body—no joking—no words implying a sense of equality. They are too glad if they only, by the most submissive and unobtrusive behaviour, be allowed to go through the world undragooned.

Some years ago, Mrs Sampson was a handsome, gaily-dressed lady, the wife of a prosperous man. She took up her full share of room on the principal streets, and bowed and was bowed to, as is only seen of ladies who have the privilege of occasionally sitting at the head of well-spread tables. But mark the sad change which a few years bring about! This good, kind-hearted, once cheerful woman, has been for some years a widow upon a small provision, has had to lachrymate sons into counting-rooms free of apprentice fees, and been obliged to petition all sorts of people for all sorts of things. She has now the sobered timid step and look of the cowed one. The glory of good feasts has departed from her, and she only knows friends to be obliged to them for little services and kindnesses, such as the worthy unfortunate never can want. She goes in half the space she once did. Her face, partly from arrangement of cap, and partly from the averted downward look, is seen but in small sections, like the moon three days from change. Life is full of lessons, and Mrs Sampson is one of them, telling (how often has it been told!) that no supposed good is secure in this sublunary scene.

Cowedness attaches to an immense variety of employed persons in all grades. Nay, some are the cowed of others who are cowed in their turn. There are some offices, where a vast deal of good behaviour is required at a moderate salary, and where there is just enough of promotion to make the organ of hope pay up the deficiency. However green and elastic the feelings with which the youth takes his desk in these vast establishments, he soon acquires the subdued, frightened look of the place. His walk gets tamed down into a stealthy movement. His voice falls, and he acquires a circumspect movement of the eyes. If, by chance, in going along an empty street, he meets a director, his heart beats as he tries to make out a proper bow, and it is an incident in his memory for a month. He comes to think all gay bouncing thoughts absurd, and vigorous procedure of all kinds only fit for inconsiderate hectoring fellows. The only way to get on is to be excessively negative, unoffending, docile—to follow, in short, the three maxims of the old newspaper editor—Caution, Caution, Caution. It is a great spurt going to a public assembly, and the height of rashness to ride to a race. His only enjoyments are quiet visits to decidedly respectable exhibitions, such as floricultural shows, panoramas, scientific lectures, and elocutionary recitations. He likes to be seen going about at his leisure hours with a sister; it looks innocent. Taking part in political matters is entirely out of the question: the board is understood not to approve of it. He does not qualify to vote, and so does not, or thinks he does not, displease any party. In this subdued tone of mind his life passes away, his exterior getting all the time more and more cowed-looking, till, at the time when all men are naturally cowed of their vivacity, he becomes a kind of Impersonated Negation. His pride is then in the paucity of the occasions when he was found fault with. Only six occasions rest in his mind, the worst being the leaving a desk one night unlocked. A terrible day that—the collector sent for him to come and speak to him in his room; yet, after all, was not very severe. The thing was hushed up—it made him take care for the future. Now, on his retirement with a small superannuation allowance, the board is full of gratitude for his long and faithful services. He treasures up the certificate to that effect which they gave him; yet half-defyingly will sometimes say that they could not withhold it, for his conduct had been such as to bear the most rigid inspection. Long pent-up humanity thinks itself entitled to this little fling at last. It is a small matter, and the general feeling of the old man's mind is all respect for the establishment. Capital office of its kind—first-rate directors—most civil, gentlemanly man Mr Smith—excellent, prudent man Mr Higgins. Yet Mr Balchild was always his favourite; cause—once met him in the pump-room at a watering-place, when Mr Balchild actually shook him by the hand. He generally retires in the evening of his days to some excessively green-painted small house in the outskirts of the town, with a small garden, out of which he contrives to torture ten times the amount of flowers that it has any right to produce. The young clerks occasionally call upon him in the leisurely Saturday afternoons, and delight him with a chat about the current affairs of the old concern. It is an immense delight to him on such occasions to remark how well "the stock" keeps up, while so many of the more flashy and adventurous establishments of comparatively recent date are at and under par. It always happens, strangely enough, that his maid has sufficient dinner for two on these occasions, and that the visiter has no engagement, though he had had serious thoughts of going to the theatre in the evening. So the two sit down and dine together at a neat little table drawn near the fire, after which tumblers and the Edinburgh Courant are introduced, and a great deal is said about the likelihood of the Duke of Buccleuch connecting his pier with the Edinburgh and Glasgow Railway. But conversation is seldom long protracted; for it is the custom of our senior to have a post-prandial nap every afternoon. He accordingly takes some opportunity, while the young gentleman is studying the criticisms on the exhibition of the Scottish Academy, to drop into an appearance which, though not really sleep, leaves the other no excuse for interrupting him when he next takes his eye off the paper. The young gentleman knows well what he ought and ought not to do at such a juncture; so he keeps quiet, takes another tumbler, and turns into the next page. Exactly at six, the old gentleman awakes with a start, and declares that he actually believes he has been asleep, though he could not have supposed such a thing of himself otherwise. He then rings for tea, *after* having asked his friend if he has any inclination for more hot water. If the young man is a really good one, he will stay out the evening, and take a hand at backgammon with his host, trusting that Providence will reward his kindness by sending some equally pleasant young friend to beguile *his* evenings, when he shall have come to the same stage in his career. In that case, a few caller oysters and another tumbler conclude the meeting, and the old gentleman goes to bed in a state of mind which is perhaps to be experienced from no kind of life more certainly than from one spent, as his has been, in gentle duties steadily performed, and a walk and conversation which, if tame, have at least been eminently inoffensive.

There is always a little man called James about public offices, who opens doors, goes messages, and attends at the ringing of bell No. 29. He was once a bold soldier in the fifty-second, and served in the Peninsular campaign; but he happened to sink into this employment, and immediately became a cowed one for all the remainder of his days. He and his wife (who puts on the fires) live in some lightless den in the lower floor: no family—or they would not be there. He has a stoop in his gait, from deference, not age, and an arranged stupidity of face to meet all contingencies. He looks upon the clerks as very great men, the manager as high priest of the synagogue, and the directors as unapproachable divinities. As a kind of squire of the office's body, he even regards it as a sort of sacred and reverend thing, by no means to be joked with. On illumination nights, he exerts himself to the utmost to make all look excessively smart, and would take it quite ill if any one were to say the National or Phœnix looked better. One rather funny clerk sometimes condescends to ask a pinch from his box, and he hands it with a full heart. No one has seen him laugh, or commit the slightest indecorum, ever since he came to the office. As for his wife, her existence is only known as an abstract truth, inferred from the evidence of the fires—no one ever having beheld her in the body. Yet James and she have their own moments of comfort, though of a darkling and dubious kind. When the office has shut for the day, they feel quite at home and independent in their vast mansion, of which having the entire charge, they almost feel as if it were all their own property. Just before closing the principal door, about a quarter past four, you may observe James holding a lively conversation with a passing policeman, through about eighteen inches of open space, the greater part of his body being within and out of sight. The last of the directors having gone out, the load of intimidation gets somewhat lightened, and the old man feels himself almost at liberty to use the freedom of indulging in a little mirth, but not at the expense of any of his superiors. Yet he almost trembles while he does so, and, if one of the clerks were to pass at the moment, would feel as if one or two of the muscles of his visage had been off guard. Not that he would expect a reprimand; but—it is as well, you know, to be careful. Instantly, of course, he would close the door, and his friend the policeman would walk on, "in maiden meditation, fancy-free."

Many other species of the cowed could be enumerated; but it might become tedious. I can patiently endure to see the peculiarity in all sorts of people, with one exception—that is, in children. Youth is the time of saliency and cheerfulness. Painful indeed it is to see these characteristics superseded by

the intimidated, subdued look, which results from harshness on the part of parents, or from the participation of the pinch of poverty. And this is, because cowedness is there so strikingly contrary to nature. Alas, alas, for those who are cowed in infancy and youth, for life can never after recover from it!

POPULAR INFORMATION ON LITERATURE.

ENGLISH VERSIFICATION.

ENGLISH verse is marked by one principal and uniform characteristic—the syllables of which each line is composed are regular and determinate in number. *Rhyme*, though a general, is not a universal feature; and the author of our great national epic, *Paradise Lost*, has shown by his practice that he did not deem it adapted, or at least essential, to the highest class of poetry in the language. With regard to *accentuation*, again, though the observance, to a certain degree, of fixed general rules is required, to give harmony to almost any species of verse, yet extensive variations in respect to the seat of accent are not only allowable, but are indeed necessary adjuncts to poetical beauty. The same law holds good with respect to the *pauses*, or rests, made in pronouncing lines of poetry. Great variations are in this particular admissible, and even conducive to beauty. At the same time, as has been said, there is so far a fixed law both with regard to the seat of the accent and the pause, that, to carry the variations too far, would render the versification rough and unmelodious.

Only in irregular compositions of the ballad class, however, is any noticeable variation of the number of syllables allowed; and fixture in this point may be held, therefore, as the one settled characteristic of English verse. Fortunately, however, no monotony has been impressed by this cause on our poetical literature. Our writers have left us examples of successful composition in almost every conceivable kind of verse. The lines have varied in length, from Fletcher's trisyllabics—

> "Move your feet
> To our sound,
> Whiles we greet
> All this ground;"

to Dean Swift's seven-league-boot lines—

> "Well! if ever I saw such another man since my mother bound my head;
> You a gentleman! marry come up! I wonder where you were bred."

In regard to rhyme, which is the resemblance or identity of the terminating sounds of the words placed at the close of lines, there has been less variety. The higher kinds of poetry admit chiefly of unisyllabic rhymes, as "shade" and "made;" and also, though much more rarely, of rhymes of two syllables, as "yielding" and "wielding." It is more common for dissyllabic rhymes to appear in humorous or light verses, as, for example, in the following from Hudibras:—

> "Though stored with deletery med'cines,
> Which whosoever took is dead since."

Only in poems of the same order do we find the trisyllabic rhyme, as in the couplet,

> "There was an ancient sage philosopher,
> That had read Alexander Ross over."

As for rhymes of greater length, they have only been used in occasional jeux-d'esprit. An additional rhyme always adds an extra syllable to the measure.

With the exception of the doggrels of Skelton, a writer who had the honour of preceding Ben Jonson in the Laureateship, no long compositions have been attempted in verses of four syllables in length. They occur in pieces of irregular construction, however; and the following is an example from Dryden:—

> "To rule by love,
> To shed no blood,
> May be extoll'd above;
> But here below,
> Let princes know,
> 'Tis fatal to be good."

In the same way do lines of five syllables only appear casually in irregular pieces, as in the second lines of a verse from the "Maid's Tragedy:"

> "My love was false, but I was firm
> From my hour of birth,
> Upon my buried body, lie
> Lightly, gentle earth."

When we come to six syllables, we do find beautiful pieces, occasionally of some length, composed in such a measure. Drayton has shown that it can be wielded most successfully for the expression of grave poetical thought. Two stanzas of his piece are subjoined; it is an "Ode written in the Peak."

> "This while we are abroad,
> Shall we not touch our lyre?
> Shall we not sing an ode?
> Shall all that holy fire,
> In us that strongly glow'd,
> In this cold air expire?
>
> In places far or near,
> Or famous or obscure,
> Where wholesome is the air,
> Or where the most impure,
> All times, and every where,
> The muse is still in ure."

It may be observed here, that *stanzas*, as verses arranged like the preceding are generically called, are formed by a succession of lines, of indeterminate length, and of any number between three and twelve. Two are called a *couplet*, and fourteen a *sonnet*; and three and four are sometimes called *triplets* and *quatrains*. Drayton's lines, now quoted, present a simple style of cadence or rhythm, a short and long syllable being alternated throughout each six. Very little variation of the measure can take place within so short a range of syllables, but it may be slightly varied, as in the lines,

> "Shall we not touch our lyre?
> Shall we not sing an ode?"

where the accent obviously falls on the interrogative "shall."

Some of the most perfect poems in the language are written in seven-syllabled lines. Shakspeare, Milton, Waller, Cowley, Keats, and others, have in this form of verse given expression to many beautiful thoughts. It was in this verse, which, according to its normal arrangement, begins with a long syllable, followed alternately by short and long to the last, that Milton wished to be

> "Some time walking not unseen
> By hedgerow elms, on hillocks green,
> While the ploughman, near at hand,
> Whistles o'er the furrow'd land,
> And the milkmaid singeth blithe,
> And the mower whets his scythe,
> And every shepherd tells his tale
> Under the hawthorn in the dale."

These lines exhibits several instances of the mode in which Milton, a great master of rhythm, sought to vary the music of his *Allegro* and *Penseroso*, and to prevent the "linked sweetness," which is characteristic of this buoyant measure, from palling on the ear, and being condemned as too "long drawn out." We allude to the occasional use of an octosyllabic line, as in the second of the above passage—

> "By hedgerow elms, on hillocks green."

Keats, whose Ode to Fancy approaches nearer to these great pieces than any similar poem, perhaps, in the language, sometimes shows us a different mode of giving variety to his verse. It is simply by altering at times the seat of the accent, as in the second line of the following passage where the poet, telling what fancy can do, says—

> "Sit thou by the ingle, when
> The sear faggot blazes bright,
> Spirit of a winter's night;
> When the soundless earth is muffled,
> And the caked snow is shuffled
> From the ploughboy's heavy shoon;
> When the night doth meet the noon
> In a dark conspiracy
> To banish even from her sky."

[Then send out fancy, and, though flakes of snow be dropping visibly on the fire,]

> "She will bring, in spite of frost,
> Beauties that the earth has lost;
> She will bring thee, all together,
> All delights of summer weather;
> All the buds and bells of May,
> From dewy sward or thorny spray;
> * * * * thou shalt hear
> Distant harvest carols clear;
> Rustle of the reaped corn;
> Sweet birds antheming the morn.
> And at the same moment—hark!
> 'Tis the early April lark;
> Or the rooks, with busy caw,
> Foraging for sticks and straw."

Might the reader not readily believe that he was reading Milton? But we forget that it is mere versification we are treating of, and with small space to do it in. Whoso would know well the measure of verse under consideration, let him turn to the poems mentioned. As a mode of attaining the necessary variety of cadence, the alteration of the seat of the accent is certainly the most legitimate, and not the least effective.

The octosyllabic verse has been the favourite one of the present age, having been that chiefly, indeed almost solely, employed by Scott, Moore, and Byron. There is about it what the latter poet called a "fatal facility," by which he meant that the simplicity of its construction induced a serious risk of doggrelising. Hudibras, for example, as respects verse, is a mere piece of doggrel. In proportion to the length of the line, the varieties of pause and accentuation have scope for increase, but the octosyllabic verse is still too short to have many. A specimen is scarcely necessary of this familiar measure, but we give a few easy lines from King, with a good moral.

> "Like to the falling of a star,
> Or as the flights of eagles are;
> Or like the fresh spring's gaudy hue,
> Or silver drops of morning dew;
> Or like a wind that chafes the blood,
> Or bubbles which on water stood—
> E'en such is man, whose borrow'd light
> Is straight call'd in, and paid to-night."

There is little variety of cadence here, long syllables following the short regularly throughout the eight. Marvel writes this measure more variedly and beautifully. Speaking of the Deity, this poet says, in allusion to the Bermudas,

> "He gave us this eternal spring,
> Which here enamels every thing;
> He hangs in shades the orange bright,
> *Like golden lamps in a green night.*"

The last line, while exemplifying varied cadence, is at once picturesquely beautiful in language, and contains a most exquisite similitude.

Of the verse of nine syllables, a word only need be said. The common effect of it is seen in Shenstone's lines—

> "One would think she might like to retire
> To the bower I have labour'd to rear;
> Not a shrub that I heard her admire,
> But I hasted and planted it there."

This sort of measure is fitted for such prettyisms of thought, but is unsuitable for graver matters. Every third syllable is long here, or, in other words, is accentuated in pronunciation. By choosing words peculiarly accented, it is to be observed, a verse of nine syllables may be endowed with a very different cadence, as may other numbers also. For example, here are two varieties of the nine-syllabled line:

> "Hylas, O Hylas, why sit we mute?"
>
> "Now that each bird saluteth the spring."

But there is a want of ease in these lines. There seems a natural arrangement of accent for each given number, and it is to this we must here chiefly attend.

The line of ten syllables is the heroic line of our language, and has been proved capable of such expression as to merit its pre-eminent place. Horror, majesty, pathos, and humour—all forms, shades, and attributes of passion—it has been found capable of embodying to the mind in fit cadence. When we look at the roll of our poets—

> "A long procession, calm and beautiful,"

who have used this measure, its capabilities for variety are put beyond all dispute. Chaucer, Spenser, Shakspeare, Milton, Dryden, Pope, Thomson, Akenside, Goldsmith, Armstrong, Cowper, Wordsworth, and Keats, are but a few of those who have tuned the heroic harp—and how different the strains of each and all!

The heroic line consists of ten syllables, and is, normally, or according to the general rule, accented on every second syllable. The pause, again, according to the same rule, should fall on one or other of these long syllables, and it is most commonly given to the fourth and sixth, that is, the second and third accented syllables, of the line. It is to be observed of the pause, that, though it usually occurs at any division of the sense, marked by a comma, yet it does not always do so; and whether any such division exist or not in a line, the pause must still be made for the convenience of pronunciation, as every reader will find. Pope, the model of formalists in heroic verse, will supply us with an exemplification of these rules. We take a passage at random.

> "But where's the man,' who counsel can bestow,
> Still pleased to teach,' and yet not proud to know?
> Unbiass'd' or by favour or by spite;
> Not dully prepossess'd,' nor blindly right;
> Though learn'd, well-bred;' and though well-bred, sincere;
> Modestly bold,' and humanly severe:
> Who to a friend' his faults can freely show,
> And gladly praise' the merits of a foe?
> Blest with a taste exact,' yet unconfined;
> A knowledge both of books' and human kind;
> Generous converse;' a soul exempt from pride;
> And love to praise,' with reason on his side?"

This passage, with the pauses marked, shows to us the source of all Pope's peculiarities. Readers feel that he differs from all other writers of the heroic verse, and that, though it may be carried to satiety, he excels all others to a wonderful degree in smoothness. Yet when they turn to Cowper, Dryden, and others, and make a comparison of their lines with those of Pope, they cannot discover any visible difference in construction. The secret is this. Pope almost always made his pauses on or at the *long* or *accented*, and not the *short* or *unaccented*, sounds. Another and more palpable peculiarity is, that he has very few variations in the seat of accent; but this is common to him with many writers, though certainly important to smoothness. Variations both in pause and accent form the Miltonic arrangement of the line—the fine, unpalling, true heroic verse. We shall take as an example of this sort of line two passages of poetry, which are in themselves beautiful. The first paints the case of Petrarch, who, with the soul of a reformer, *fed on love* till he fell into womanishness.

> "Ay,' so delicious is the unsating food,
> That men,' who might have towered in the van
> Of all the congregated world,' to fan
> And winnow' from the coming step of time
> All chaff of custom,' wipe away all slime
> Left by men-slugs' and human serpentry,
> Have been content' to let occasion die,
> Whilst they did sleep' in love's Elysium."

Here is a description of a *well*:

> "Some moulder'd steps' lead into this cool cell,
> Far as the slabbed margin' of a well.
> Whose patient level' peeps its crystal eye
> Right upward' through the bushes to the sky."

These lines, which, it will be seen, vary the pauses from short to long, are from John Keats, who, because there occurred *one* bad rhyme in his *Endymion*—indeed, in the whole of his four lengthened poems, containing about seven thousand lines in all—was deprived by malice, backed by ignorance, of the place which he merited, whatever might be his dues in regard to other poetical attributes, as one of the first masters of rhythm and rhyme in the language. Time, just time, is working the cure.

We are exceeding our limits, and would only beg the reader to apply the test as regards variation in pauses and accents, but chiefly pauses, to Shakspeare and others, and he will find the source of their un-

cloying music, so unlike the smooth and tedious sameness of Pope. Look at Shakspeare's :

"I know a bank' whereon the wild thyme blows,
Where oxlips' and the nodding violet grows;
Quite over-canopied' with lush woodbine,
With sweet musk-roses' and with eglantine;
There sleeps Titania' some time of the night,
Lull'd in these flowers' with dances and delight."

Here both pauses and accent are varied, and how exquisite is the music compared with the lines of Pope or his follower Darwin!

Milton was a great master of rhythm, and from his practice we may gather certain other rules relating to versification. Either from perfection of musical ear, or taught by observation, he well knew the necessity of *mixing the vowels* freely in his lines. If examined, they will be observed to owe much of their melody to this variety of vowels. For example, look at the majestically harmonious opening of Paradise Lost :—

"Of man's first disobedience, and the fruit
Of that forbidden tree, whose mortal taste
Brought death into the world, and all our woe,
With loss of Eden, till one greater Man
Restore us, and regain the blissful seat—
Sing, heavenly Muse."

As any two sounds of one vowel are perfectly equivalent to so many different vowels, it may be said that the same vowel is scarcely ever repeated in any one of these lines. Examine Milton further, and his constant attention to this point will be apparent. Again, the further art of using particular verbal sounds, to express particular sentiments, was thoroughly known to him. The ancients practised the same art; and Pope, it will be remembered, says,

"The sound must seem an echo to the sense:
Soft is the strain when zephyr gently blows,
And the smooth stream in smoother numbers flows;
But when loud surges lash the sounding shore,
The hoarse rough verse should like the torrent roar."

These lines are intended, of course, as an instance of what they point to; and, in other passages, Pope tries to exemplify the same thing—as in the line,

"Up the high hill he heaves a huge round stone."

But the artifice is here too palpable. Milton could produce the effect, and yet conceal the art. How beautifully consonant with the sense, and yet easy and natural, are such lines as

"Quips, and cranks, and wanton wiles."

"On the light fantastic toe."

When he takes up his thunder-trumpet, again, how appropriately awful his language!

"Him the Almighty Power
Hurl'd headlong flaming from the ethereal sky,
With hideous ruin and combustion, down
To bottomless perdition."

When he would make his verse tell of toil, in sound as well as sense, he speaks thus :

"The fiend
O'er bog, or steep, through strait, rough, dense, or rare,
With head, hands, wings, or feet, pursues his way,
And swims, or sinks, or wades, or creeps, or flies."

A fine natural ear teaches the poet to attend to these points, and, without attention to them, versification of the highest order cannot be produced. We shall give some instances in which a late poet seems to us to have succeeded admirably in this respect, and yet to have done so with so much delicacy of taste and touch, that no suspicion of any straining after effect is engendered. The following line is like an ocean-shell applied to the ear :—

"The surgy murmurs of the lonely sea."

The very sound spoken of is heard, too, when the poet tells us, that

"streamlets fall
With mingled bubblings and a gentle rush."

In the same way do we enter into the description, when he speaks of one who saw at morn

"the horizontal sun
Heave his broad shoulder o'er the edge of the world."

And we forget the crackle of the winter fire when told of the coming musk-rose,

"The murmurous haunt of flies on summer eves."

It may be thought that we are showing a prepossession in referring so much to John Keats, whose lines these are; but our object is to illustrate the art of versification, and all our examination has been unable to discover any more perfect and fitting source of examples. Shakspeare is too well known, and Wordsworth, ever sustainedly great in his poetical diction, is rendered by that very equability less fitted to be the source of individual lines for our purpose.

No long poem of note has been composed in our language in lines of twelve syllables, with the single exception, we believe, of Drayton's *Polyolbion*. The line is lumbering and awkward, when so used.

"Let all the world be judge, what mountain hath a name,
Like that from whose proud foot there springs a flood of fame;
And in the earth's survey, what seat like that is set,
Whose streets some ample stream abundantly doth wet?"

It is, or rather was, much more common to use the line of twelve syllables to give occasional variety to the heroic verse, and Dryden was peculiarly fond of so employing it. The following is an example of the manner in which he heightened the effect of a sentiment by the introduction of an Alexandrine, as the line is called :—

"Now free, from earth thy disencumber'd soul
Mounts up, and leaves behind the clouds and starry pole."

The Alexandrine is also used to terminate the Spenserian stanza of nine lines, and, while giving an example, we give also a most exquisite image, from the "Eve of St Agnes," describing the spirit of a sleeping maid as

"Flown like a thought until the morrow-day;
Blinded alike from sunshine and from rain,
As though a rose should shut, and be a bud again."

The addition, simply, of two syllables to the heroic line, without any change in accentuation, makes the preceding one; and sometimes lines of fourteen syllables, similarly constituted, are introduced into heroic verse, as in the triplet of Dryden—

"While all thy province, nature, I survey,
And sing to Memmius an immortal lay
Of heaven and earth; and every where thy wondrous power display."

This line, however, is more often used in irregular and occasional pieces. The same thing may be said of the line of eleven syllables, to which it is scarcely necessary to allude. In its common form, it has the dancing cadence of the other odd-numbered lines, as will be seen by the subjoined couplet from Congreve :

"Apart let me view, then, each heavenly fair,
For two at a time there's no mortal can bear."

We have carried these hints on versification farther than was intended, and must at once conclude. Our remarks may perhaps induce a few of the many who cultivate poetry, to examine the principles upon which the great poetical works of the language are constructed; and should such be the result, we may flatter ourselves with having done the world at large a favour, since it seems hopeless to expect any ebb in the swelling tide of modern verse.

THE COUNTESS D'AURAY.

A TALE.

When Sir Walter Scott first met a lady to whom he was attached, after her elevation by marriage from a comparatively humble to a very lofty rank, he felt extremely anxious to learn whether or not she was happy in her new condition. He knew she had sustained no serious ills, but he had seen by experience, he says, that our happiness is much more often affected by evils which we create for ourselves, in spite of the blessings of fortune, than by real and severe ills. He illustrated the remark by reference to the case of the gentleman, who, in the midst of all manner of comforts, was rendered utterly miserable by the daily sight of a neighbour's turkey. We have found a little story in one of the foreign journals, which so forcibly illustrates the same maxim, that we are tempted to translate it.

M. de Manleon, a young French gentleman, left the school of St Cyr at the age of twenty-one, with an ensign's commission in his possession. His mother had obtained for him leave of absence for three months, and came to Paris to carry him off for that period to Poitou, anxious to enjoy his beloved society while she could. They left the capital together in a post-carriage, and travelled a great part of their journey without any remarkable adventure. At length, a little incident occurred which greatly interested M. de Manleon. The travellers reached a steep hill on their way, and M. de Manleon leapt out to relieve the horses, leaving his mother inside. He had scarcely walked a few paces, when he found himself surrounded by a band of village children, who, as wont in the rural districts of France, offered him bouquets of flowers, expecting some little remuneration in return. But as soon as they noticed the lady, they flew to the coach side, and threw their flowers to her. One child alone remained—a girl of thirteen or so, whose uncommon beauty arrested forcibly the notice of M. de Manleon. She was a brunette of a clear and shining complexion, with an admirable form, and teeth as white as ivory. She stood smiling before the young man, but timidly kept her flowers in her hand, afraid to present them.

"What is your name, my dear?" said the officer. "Marie, sir," answered the girl. M. de Manleon spoke no more, but stood gazing at the child, thinking to himself that all the portraitures of youthful beauty which he had ever seen were outdone by the work of nature before him. Marie's eyes were cast on the ground, and she did not observe the closeness of his gaze, but others did. A young village lad, of fifteen or sixteen, leapt from the wayside, and looked at the officer with eyes full of anger and jealousy. M. de Manleon had little time to notice this addition to the scene, for the voice of his mother was heard calling on him to come and proceed. The young officer hastily took the bouquet of Marie, and having emptied his purse of its whole contents into her hands, he obeyed his mother's call, and soon saw the villagers no more.

M. de Manleon, when he had time to reflect on the past incident, repented, not of his generosity, but of the way in which he had exercised it. A small medallion, containing his own likeness and that of another dearly cherished person, had been in the purse, and had gone with the rest of the contents. To reclaim it would have been difficult; and the young officer was forced to submit to the loss in silence.

For ten or twelve years, M. de Manleon continued in the army. He at last left it to enjoy the pleasures of a retired, or at least a private life, to which he had ever been attached. After spending some time with his mother in the country, he came to Paris, and there mixed with moderation in the social enjoyments of the great world. One evening, a friend asked him to go to a party, and allow himself to be presented to Madame d'Auray, wife of Count d'Auray, a lady of consummate beauty, and whom all Paris spoke of as the happiest of women. There was (said M. de Manleon's friend) a sort of pleasing mystery about her, too. M. d'Auray had suddenly appeared with her in Paris, and presented her to his relatives and friends, without saying ought of her birth or name to any one. She was nevertheless universally loved and admired. M. de Manleon permitted himself to be persuaded into a visit to the mansion of this happy paragon of female loveliness. When he was presented to her, a confused idea struck him that he had seen her before, but he could not remember when or where. The idea made him thoughtful, and he retired to the recess of a window, where he for a time stood alone.

A soft and sweet voice at his side made him hastily turn round. "Have you been lately in Poitou, sir?" said the Countess d'Auray, for she it was who spoke. "Not lately, madam," answered M. de Manleon; "our property there was sold. Are you acquainted with Poitou, may I ask?" "I am, sir," said the countess, and, as she spoke, she took a bouquet of flowers from the window, and held them up before him with a smile. A light broke in upon M. de Manleon's mind. "What!" cried he, "are you—can you be"——"Poor little Marie, and no other," answered the countess; "ah! I was happy then!"

The little incident of the wayside formed the basis of an immediate friendship between M. de Manleon and the countess, who remembered him well through the medallion. The last exclamation of the lady had startled him, coming as it did from one whom all deemed happy. Afterwards, when they were better acquainted, he got an explanation from herself. "I remember," said the countess, "that Pierre was by my side at the time when you saw me on the road. That young peasant was my lover, and, though scarcely old enough, you would suppose, to entertain such a feeling sincerely, yet I loved him also. Two years rolled away, and our love continued to exist and increase. I was fifteen. One day Pierre and I quarrelled, and I, thinking he had shown much hastiness and bitterness of temper, would make no concessions to him, though perhaps myself in the wrong. At that very time, a young gentleman saw me by the wayside, as you did, when passing. He seemed struck with my appearance, indeed greatly so. The compliments which he paid me I repeated with triumph to Pierre, and they only made him more angry and jealous. He had reason to be yet more so afterwards. The young gentleman of whom I have spoken returned, and told me that he could not forget me. He asked me to go with him, and he would make me a great lady. You would now say, sir, that I stood a fearful chance of falling into the gulf of ruin and misery. Not so; the young gentleman had a soul too noble, too honourable, to be the cause of misery to any one, and his views for me were in accordance with that spirit. I listened to him with mingled feelings. I was an orphan; no one was near me to caution or to counsel. Pierre was my only tie to my birthplace, and it was on his account that I felt distressed. I gave him opportunities to renew his addresses; but his anger and jealousy prevented him from doing so. I yielded to the pressing suit of the other, and was whirled off in a carriage from Poitou. Before I had gone far, I repented of my conduct, and entreated with tears to be carried back to Pierre. But my mind became calmer ere long.

My incaution could only be excused in a village-girl of fifteen. But I was in safe guidance. It was to a school near Paris that I was conveyed by the Count d'Auray, who, as you may imagine, was the person now alluded to. For five years I remained in perfect seclusion, enjoying the best advantages of education. At times the count visited our seminary, and I learnt to love him fondly. How could it be otherwise? In my benefactor I saw the tenderest of lovers, and most amiable of men—young, handsome, and accomplished. Pierre was forgotten, and I became the Countess d'Auray.

Ah! M. de Manleon," continued the countess, "can you conceive, after this recital, the cause of the secret grief that preys upon me? Pierre is the cause. Old feelings have returned upon me. Madwoman that I am, I regret the hours of flower-gathering by the way-side; I figure to myself the happiness that I have lost as excelling that possessed; I dream of being a peasant's wife, the owner but of a cot, a cow, and a little garden! These thoughts haunt and pursue me. Yes, sir, they make me miserable—me, who so dearly love my husband! What madness!"

As the countess said this, she shed abundance of tears. M. de Manleon pitied her sincerely; but he said, "Madam, this misery is but the result of an excess of happiness. You are absolutely satiated with blessings." "Ah! M. de Manleon," continued the countess, "but think how much poor Pierre Billon regrets me! Perhaps he has died of grief; and it was I, too, who was in the wrong in the quarrel which separated us." M. de Manleon continued for some time to talk and reason with the lady. He tried the force of ridicule, and painted Pierre not as the flower-gathering boy of her fancy, but as a coarse uneducated clown, whose society would be intolerable to her cultivated mind, and who lived in a state very unlike the Daphnis or Meliboeus of her Arcadian dream. He

would probably be married (said M. de Manleon) long ago, and possibly was vicious, and beat his poor wife. All this sort of reasoning only drew a sigh from the lady. She was silenced, but not convinced.

In time, M. de Manleon became an intimate friend and constant visiter of the Count d'Auray and his lady. He saw that the latter indeed loved her husband most fondly, and in his presence forgot all her distress; but it returned to her in solitude. One day, while M. de Manleon was seated with the countess, conversing upon the usual subject of their tête-a-têtes, the Count d'Auray entered, pale and agitated. The countess sprung up. Her husband embraced her, saying to M. de Manleon, "Behold my consolation when I am vexed!" "What has happened?" said the countess, anxiously. "Not much, my love," was the reply; "only we must economise. I must sell some part of my property, keep but one carriage, and give dinners but once a-month. I have lost a large sum of money." "Thank Heaven it is nothing worse!" cried the countess. "How did this loss occur, may I inquire?" said M. de Manleon. "Folly on one side, and villany on another," answered the count. "I had for some time entertained the thought of purchasing in the funds, and, meeting at the house of one of my friends a certain broker named M. Dennevers, who was recommended as an active man of business, I intrusted him with the means of making the necessary purchase. This worthy broker took my money with great coolness, and next day went off, no one knows where."

"Have inquiries been made?" said M. de Manleon.

"Oh, yes!" answered the count; "we have at least had the satisfaction of discovering who he was. His history is rather odd. He was first a peasant, became next a village-clerk, and finally settled in Paris as a sort of low agent in the brokerage way. He wormed himself there by degrees into the confidence of so many people, as to get large sums into his hands. You know the rest. By the by," continued the count, addressing his wife, "he is a countryman of yours. We learned that he came from Poitou, and that his name was not Dennevers, but Pierre Billon. The rascal has left a wife, too, an excellent woman, whom he abused and neglected, completing his rascality to her by carrying off with him another person, an infamous character. But I must go to consult further with my fellow-sufferers." So speaking, the count departed.

M. de Manleon looked at the countess. "What think you now, madam?—a villain—a wretch!" "Oh! M. de Manleon," cried the countess, with tears in her eyes, "how senselessly ungrateful have I been to Heaven for its mercies! I am cured! I *am* happy! And you, my friend"——"Ah, madam, I passed the wayside in Poitou two years too soon!" cried M. de Manleon, with a smile.

LETTERS FROM A LADY IN LONDON TO HER NIECE IN THE COUNTRY.

CHRIST'S HOSPITAL, &c.

MY DEAR JANE,—My last letter referred to the western part of the metropolis, in which are situated the palaces of the queen and many edifices of a very splendid description, equally large with Stafford House, which I described, and which are occupied chiefly as the town residences of the nobility or other persons of wealth and distinction. I now wish you to accompany me in an excursion into the *city*, which is the true old London, and the great seat of all kinds of commerce. The streets in this quarter are generally narrow, and lined with tall brick houses, rather dingy in appearance, but, from the little glimpses I have got, all remarkably neat and clean within doors. Besides being narrow, the thoroughfares are densely crowded with foot-passengers, omnibuses, waggons, and, indeed, every species of vehicle, so that it is often not easy to get comfortably along; still, there is a wonderful liveliness in the scene, and so many things for a stranger to look at, that I must say I enjoy the city as much as I do the west end of the town.

Among the various establishments to which I was conducted in this part of London, none afforded me so much satisfaction as Christ's Hospital, or, as it is here familiarly called, the Blue-Coat School—one of those large charitable institutions with which the metropolis abounds. A visit to this interesting place would have, perhaps, afforded you more pleasure than any thing I have yet seen; and, if you will give me leave, I shall detail, to the best of my ability, what fell under my own observation. I was conducted over the hospital by one of the governors, and had therefore an opportunity of seeing some of the departments not usually shown to visiters.

The buildings belonging to this institution occupy a spacious area which opens up into Newgate Street, the large court-yard being merely separated from that bustling thoroughfare by iron railings. By an alley near this court-yard, leading past Christ's Church, we entered a square of fine old buildings, with cloisters or a covered walk running round it; but the courts, and squares, and buildings in connexion with the hospital are so numerous, that I may mistake the order in which they occurred. I daresay you will remember having read in history of the establishment of this school by the youthful and pious King Edward VI., whose memory appears to be held in grateful remembrance, as far as the erection of statues, portraits, &c., is supposed to indicate gratitude. The hospital was opened in 1552, in buildings formerly occupied by a monastery of Greyfriars; but these have in course of time disappeared, and been succeeded by several large structures of stone and brick, of different ages, care being taken to preserve, as far as convenient, the Gothic style, with covered cloisters or arcades round the different courts. The institution has likewise been extended considerably in its operations since its first commencement, by bequests left by various charitable persons. The annual revenue now amounts to L.40,000. Charles II. endowed a mathematical school for the instruction of forty boys, which was subsequently extended by a Mr Travers, who founded another class for mathematics, comprehending thirty-seven boys. There are now educated within the institution eight hundred and fifty boys; and at a school in connexion with it, at Hertford, a few miles' distance from town, there are between three and four hundred of a somewhat more youthful age, including, I believe, some girls.

The boys are the funniest-looking little fellows you ever saw, their dress having undergone little alteration for three hundred years. It consists of a long blue coat, reaching nearly to the ankle, and bound round the waist by a girdle of red leather; the lower garments are in the shape of little breeches, fastened at the knee, exhibiting to the utmost advantage stockings of bright yellow.* They wear no hat; I believe each has a small round article like a saucer, called by the name of cap, but they seldom appear with it. From the neck depend little bands of white linen. In addition to this, they have each a yellow petticoat in winter, which they wear under their pelisse or coat. It is curious to see a fashion, in itself so quaint, handed down in all its purity for three centuries; but there appears a dread of encroaching on any of the customs, however unimportant in themselves, from a fear that innovations of a more serious kind might follow. In some respects, however, I believe the charity has been liable to abuse, for I was told there had been instances of boys being placed there, for the benefit of education, whose parents were in circumstances far removed above the necessities to meet which the hospital was originally endowed. The principal innovation of recent date was the establishment of a class for French, which was not formerly taught. As yet, the physical sciences are excluded from the ordinary routine of instruction.

The first room to which we were introduced was that appropriated for writing. This is a long, well-lighted hall, with long tables from one end to the other. There were several masters attending, who take one half of the boys in the forenoon, and the other half in the afternoon. We were shown several *copies*, some of them by very young penmen, and they certainly did them great credit. The next department we saw was the grammar school, equally large, containing another large section of the lads. The masters occupy small rooms at each end of this apartment, where the lessons are repeated, the masters using the precaution of having glass doors, through which they see all that goes on.

We were next conducted to another and much larger edifice, in the lower part of which was the kitchen, from which issued a most satisfactory savour of the good things of this life, showing that, while the mental cultivation of the youthful inmates went vigorously on, the wants of the body were not disregarded. Descending a flight of steps, we found the kitchen to be a spacious and airy apartment, beautifully clean, having on one side a series of ovens, at which there was a respectable man-cook attending to the contents, consisting of thirty-eight legs of mutton. One of the boys was cutting the bread to be used at dinner, which another was ready to carry in a basket to the hall. We were now taken to the washing rooms for the boys, which were furnished with long rows of wooden troughs; and I believe every one must wash separately, as they were at one time very subject to ophthalmia, which was augmented by careless or promiscuous washing. The infirmary, in a separate building, next claimed our attention; and it was gratifying to find that, out of eight hundred and fifty boys, there were only eleven in the infirmary, and some of them only for a day or two. This room was exceedingly clean, with little open beds ranged along each side, the linen as pure as snow. This department is looked after by a kind and careful nurse. In an upper floor of a house detached from the preceding, are the sleeping-rooms, all of which appeared to us to be in excellent order, clean, light, and airy. Each contains several rows of beds, and at the foot of each bed is a small chest containing the clothes of the occupants. Each room or ward is superintended by a matron, whose private apartments are immediately adjoining. Off from each ward there is a small room for the use of the monitor, one of the older boys, who is called, by way of distinction, a *Grecian*, and takes a charge over the rest. We were told that the preceding week one of these young gentlemen had been sent off to the university, having completed his studies in the most creditable manner. It was now near the dinner hour, and the squares were filled with "playful children just let loose from school." Some were amusing themselves with skipping-ropes, hoops, balls, &c., while a band of the senior lads walked up and down, arm in arm, engaged in conversation. These were distinguished by an epaulette on one shoulder, being designed for the navy. We next proceeded to a building behind, on the upper floor of which I was shown the director's room, a large comfortable apartment, the walls adorned by some quaint old-fashioned looking portraits of patrons of the institution—amongst the rest were two pictures of Edward VI., one taken while he was in bad health, representing him pale and sickly, as if in the last stage of disease. In this room there is a very fine specimen of penmanship executed by one of the boys, being a copy of an address presented by a deputation of the pupils to the Queen on the occasion of her Majesty's visit to the city. In a small anteroom is a curious map of London as it was in 1647, with only one bridge across the Thames: what a contrast to London as it is, or as it will be in 1847! In the lower floor of this edifice is a large office or counting-house, in which the business of the establishment is conducted by a secretary and clerks. By the politeness of one of these gentlemen, I was furnished with some information respecting a branch of the charity which is little known. This is an endowment which furnishes a small annuity to any person in poor circumstances who is blind, and above (I think) 65 years of age, but who has never received parish relief; the annuity is ten pounds per annum, and refers to persons in any part of the United Kingdom.

Leaving this place, we made our way to the edifice containing the dining-room—a very large and elegant Gothic hall, resembling the Parliament House at Edinburgh, measuring 187 feet in length, 51 feet in breadth, and 47 feet in height, being the structure the most ornamental in exterior aspect, and that which is seen from Newgate Street. The walls of the hall, which is one floor up, are of oak, with a gallery at the farther end. This part of the various structures was erected so lately as 1825. It is lighted by lofty windows, some of which are filled in with brilliant stained glass, bearing the arms and emblazonments of governors and patrons of the institution, many of whom were educated in the hospital, and, having attained to wealth and eminence in their various pursuits, have taken this means of evincing the deep sense they entertained of the valuable privileges they had enjoyed in their youth. We now placed ourselves at the head of this large and splendid apartment, while the youngsters streamed in from the opposite extremity. Four long tables, placed lengthways in the room, and one at top, being covered and laid with wooden trenchers, the boys took their places on each side, one acting as waiter for a certain number, in order to prevent confusion. The legs of mutton were now introduced, in hollow wooden dishes, carried by boys on their shoulders, also thirty-eight wooden pails, beautifully clean, containing potatoes. A Grecian, or elder boy, now mounted the pulpit, which occupied a conspicuous place on one side of the room, and silence being enforced by a presiding master by three strokes of a hammer, he proceeded to read a short chapter from the Bible; when this was concluded, the boys all fell down on their knees, while a blessing was asked, to which they all responded most heartily. The spectacle of between eight and nine hundred boys dressed in their antique garb, sinking to their knees at a given signal, and in this posture uttering thanks to the Almighty for his gracious bounty, was, I can assure you, strikingly grand, and in no small degree affecting. The grace being finished, all arose, and dinner commenced. The meat was carved by fifteen nurses (a motherly-looking set of women, each at a particular station), and carried by the assistant boys to those seated at the tables, each boy getting a pretty large slice, three potatoes, half a small loaf, and small beer or water according to his taste. It is impossible to imagine a more delightful scene than this—eight hundred and fifty fine little fellows, all as happy as they could wish to be. And then the countenances were in themselves a study—such variety of feature and expression! But whatever the habitual expression might be individually, they seemed united in heart and purpose in doing justice to the good things before them. I have seen hospital children to whom it would have been an act of positive cruelty to have wished an *appetite*, the means for satisfying it not being within their reach; but here there was no feeling of that kind; the healthy, cheerful appearance of the boys showed that their wants were liberally supplied. One day in the week they have soup, another day pudding, salt beef another day, roast beef, and so on, till roast mutton day comes again; and the governors purchase the best meat that can be obtained. They have bread and milk for breakfast,

* [The breeches, we believe, are an innovation of comparatively modern date.—ED.]

bread with milk and water for tea, and bread and cheese for supper. Here terminated my visit, and I need scarcely say how much gratified I was with the exhibition of this munificent establishment, which I left more than ever impressed with admiration of the noble and generous spirit with which every thing is conducted in this great and liberal country.

My next visit of curiosity was to the hall of the Goldsmith's Company. You must understand that in the city there are a number of corporations of tradesmen, some of which are very wealthy, and own splendid edifices, in which they hold their stated or occasional meetings. Speaking at random, I should think that in some instances fifty or sixty thousand pounds must have been lavished in building and furnishing these halls, as they are termed. That which I now went to visit, at a short distance from Newgate Street, belonging to the Goldsmith's Company, is, I suppose, reckoned the finest in the city.

Unfortunately, this magnificent building, which was finished only in 1835, is placed in a secluded situation behind the new Post-office, and is crowded so much on all sides by houses, that its beautiful exterior is utterly lost. It is two storeys in height, with eleven lofty windows in front, the centre windows being divided by a row of six elegant Corinthian pillars. On entering, we found in the vestibule a large polished stove, with a noble fire, beside which stood a huge luxuriously stuffed chair for the porter. If this personage has not been rendered lazy by such indulgence, he certainly has every inducement to become so, with such a fire and such a seat; but let us see what is beyond this. The entrance to the inner lobby is by glass doors; this fronts the staircase, which has a grand and imposing effect.

Immediately above the first landing-place, from which the stairs lead off to the right and left, is a full-length portrait of William IV., and below this is a marble bust of the same monarch. This hall and staircase are lighted from the roof, which is supported by lofty pillars of greenish marble. By a door on the left gallery we entered the dining-hall, a magnificent room, with five large windows to the back of the house. The pillars in this apartment are of yellow scagliola. One side of the room is ornamented by full-length portraits of William, Adelaide, and Victoria, in their robes of state. The chandeliers, of which there are five, composed of crystal, are of the most superb description, and, when lighted, must have a dazzling effect. The carpet is also luxuriously rich, giving an idea of warmth and comfort. Long mahogany tables were laid out the whole length of the room, with chairs on each side, as if ready for the company who were expected next day (Lord Mayor's Day), covered with crimson morocco, with the arms of the company carved on the back of each. At the farther end, raised a few steps, is a recess, as if for a throne or chair of state, hung tastefully with draperies of crimson cloth; behind this the plate is kept, and on festive occasions is displayed in this recess. A passage from this end of the room conducts to the council-chamber, the walls of which are hung with green, with green damask window-curtains, lined with lutestring. On a marble table at the upper end is a curious stone, enclosed in a glass shade, which was found under the foundation of the old hall. There is a figure carved in the stone in a Roman costume, but it is very much worn by time, as you may suppose.

Opposite to this, on the other side of the passage, is the drawing-room, an exceedingly elegant apartment. The walls are covered with crimson satin damask, relieved by a border of white paint, united to the satin by a graceful scroll of gilding. The sofas and chairs are of the same material as the walls, as are also the window-hangings, which are lined with lutestring. Elegant little tables of white marble, with gilt pedestals, are placed along the side of the room. The chandelier and ceiling are superbly gilt, and rich gilt candelabra here and there complete the list of attractive objects in this room. We were led from this to the small dining-room, which has been the scene of many capital dinners, I could suppose; but *dinner* is scarcely the proper term—it should be *feast* or *banquet*, when applied to one of the princely companies of London, the metropolis of an essentially feasting nation. Well, then, this minor dining-room possesses all the attributes for comfort in an uncommon degree; it is neither too large nor too small. The walls are oak, and the furniture mahogany: at the extreme end, within a shallow recess, stands a sideboard, surmounted by a large mirror, hung with drapery of crimson velvet; this reflects and multiplies the plate. The window-hangings are of crimson. The mantel-pieces in all the rooms are extremely beautiful, being of carved white marble. Near to this is the tea-room, rather gloomy in its aspect, but somewhat enlivened on one side by the portraits of lord-mayors belonging to the company, grouped in one picture. Some of these worthies lived and enjoyed their civic honours as far back as 1551.

We next descended to the kitchen, where preparations were being made for the feast of the following day, under the able superintendence of various cooks, male and female. The fireplace was of enormous width—I daresay ten or twelve feet; the heat rendered more intense by a tin screen of the same gigantic proportions; and here a spit, that would have borne an ox, was revolving gaily with about a dozen fowls. It was well we allowed the kitchen to be the last place we saw, as it increased our desire for our own dinners to such a degree that we speedily made our way home, in the enjoyment of appetites that even a lord-mayor might have envied.

STATISTICS OF EDUCATION AND OF EARLY MARRIAGES.

Among the various methods by which the Registrar-General has endeavoured to turn the records deposited in his office to useful account in illustrating the condition of the people, the practicability seems also to have occurred to him of deducing from the marriage registers a criterion of the state of education, so far as regards the ability to write, among the adult population throughout England and Wales. Every register of marriages being signed by the parties married—those who are able writing their names, and those who are unable, or who write very imperfectly, making their marks—it appeared to the Registrar-General that an enumeration of the instances in which the parties married have signed by a mark, instead of writing their names, would serve to indicate the proportion among them who either could not write at all or write very imperfectly. And in his second annual Report, a table is given as the result of such an enumeration, exhibiting the proportion per cent. in the metropolis, in each English county, and in North and South Wales, of persons married in the year ending June 1839, who had used marks.

From this table it appeared, that in fifteen of the English counties—namely, Berkshire, Hertfordshire, Buckinghamshire, Huntingdonshire, Bedfordshire, Cambridgeshire, Essex, Suffolk, Norfolk, Wiltshire, Shropshire, Worcestershire, Staffordshire, Lancashire, and Monmouthshire, and in North and South Wales—more than 40 per cent. of the men were unable to write their names; and that in the West-Riding of Yorkshire, in Wales, and in nineteen of the English counties, more than half the women were similarly deficient in this primary element of education. It also appeared, that in the whole of England and Wales, out of 121,083 marriages there were 40,587 men and 58,959 women who could not write.

It was further observed, that the education of the men, in respect to the ability to write, was superior to that of the women, the proportions per cent. of those who were deficient being for males 33 and for females 49 in the whole kingdom; and a superiority, greater or less, was maintained by the men throughout every county.

This return also indicated a decided superiority with regard to the ability to write in the metropolis, as compared with the rest of England and Wales, and, next to the metropolis, in the north of England, including the counties of Durham, Northumberland, Cumberland, and Westmoreland. On the other hand, the most marked deficiency was in Lancashire, Bedfordshire, Monmouthshire, and Wales; in Lancashire, the proportion who had signed with their marks, was for men 43, and for females 65, per cent.; in Bedfordshire, for men 55, and for women 66, per cent.; in Monmouthshire, 54 for men, and for women 67, per cent.; and in Wales, for men 46½, and for women 70, per cent. But in the metropolis such proportion was only 12 per cent. for men, and 24 for women; and in the northern counties, for men 21, and for women 42, per cent.

The Registrar-General put forward these calculations, in the first instance, with evident and necessary caution, remarking, that it was not to be hastily assumed, upon the evidence afforded by the returns of a single year, that the inhabitants of any particular county or district were less educated than their neighbours, and that it was requisite that this experiment should be oftentimes repeated, and attended with similar results, before any such inference could be drawn with safety. "It must also," he observed, "be remembered, that although a fair average is thus afforded, the portion of the whole population exhibited in the yearly returns of marriages is small;" and such portion, whose signatures appear on the marriage-registers of a single year, is sufficiently small to be easily affected by accidental circumstances. At the same time, it must be observed that this criterion is free from the objection of selection, including every class and condition and every age, except children and very old persons, and it is almost impossible that the same person should have signed twice in the same year.

In the last annual Report of the Registrar-General, just published, a similar calculation is contained, showing the proportion per cent. of the persons married in the year ended June 1840, who signed with their marks, and the result is strikingly coincident in every respect with that of the preceding year, and such as to induce the belief that the evidence contained in the marriage-registers on this point will furnish a safe and valuable criterion of the state of education (at least elementary education) among the adult population, and serve, in each succeeding year, by comparison with preceding years, to indicate its progress or retrogression.

It has been calculated in the last Report (which embraces the year ending June 1840), "that in thirteen English counties, in the West-Riding of Yorkshire, and in Wales, more than 40 per cent. of the men married did not write their names; and that in nineteen English counties, in the West-Riding of Yorkshire, and in Wales, the same fact existed with respect to half the women." It also appears, that in the whole of England and Wales, out of 124,329 couples married, there were 41,812 men, and 62,523 women, who, it is presumed, either could not write or wrote very imperfectly.

The Registrar-General observes, that "if the table for the year ending June 30, 1840, had shown results differing widely from those of the preceding year, it might reasonably have been suspected that such returns were not likely to become valuable and safe criterions of the comparative state of education; that they are drawn from too small a portion of the whole population, and are too much influenced by accident." Such, however, he says, is not the case. A comparison of the table given on this subject in the second report with that in the third, shows a remarkably close correspondence in the results, not only for the whole kingdom, but in the metropolis, and in every considerable group of counties. In the metropolis, indeed, and in two out of the ten divisions of counties, the mean proportion is precisely similar; in six others there is only a difference of one, in another the difference is two, and in the remaining one it amounts to three.

It may be necessary to state, that this criterion of the comparative state of education, as respects the ability to write, can only be applicable to the *past*—that is, to such as existed ten and twenty years ago—and can throw no light upon the amount and nature of the education now afforded.

Such are the statistics, deducible from the English marriage-registers, as to the state of education, with regard to the ability to write, among the adult population. Scarcely less interesting is the light which the Registrar-General, in his last and preceding reports, has contrived to throw upon the propensity to marry in early life, as such propensity is manifested, in various degrees, throughout the different portions of England and Wales.

In the tabular abstract of marriages subjoined to the last report, is included the number of persons, distinguishing males from females, married during the year ending June 1840, who were under twenty-one years of age; and in the report itself is embodied a table, exhibiting the proportion per cent. of each sex married under that age to the whole number of marriages, in the metropolis, in each English county, and in North and South Wales.

The general result for the whole of England and Wales appears to be, that out of the total number of marriages solemnised during the year ending June 1840, and which amounted to 124,329, 24,010 of the parties married were under the age of twenty-one years, namely, 6100 males, and 17,909 females; and the proportion per cent. which the minors bear to the whole number married is for men 4·90, and for women 14·40—the mean proportion being 9·65. This proportion is in a slight degree higher than that of the preceding year, when the numbers married under age were 5628 men, and 16,414 women; and the proportions per cent. to the whole number married 4·64 and 13·55 respectively: mean proportion, 9·09.

The counties in which these early marriages appear most highly to have preponderated, are Bedfordshire, Huntingdonshire, Cambridgeshire, Northamptonshire, and Hertfordshire, making five out of the eight counties composing what is called the south-midland group of counties; next in Essex, one of the three eastern counties; afterwards in the West-Riding of Yorkshire; then in Staffordshire, one of the six western counties; next in Wiltshire, one of the five composing the south-western group; and so on. A similar result, with the exception of Wiltshire, was shown for the preceding year. The results of the preceding year likewise show a remarkable similarity to those of the last year respecting those portions of the kingdom in which early marriages have been most rare.

The disposition towards early marriage appears most rarely to have exhibited itself in the metropolis, as compared with the rest of England and Wales, where the proportion per cent. is only 1·75 for men, and 8·30 for women, which exhibits a striking difference in favour of the metropolis when compared with Bedford, for example, the county in which early marriages are shown to have prevailed in the highest degree, namely, in the proportion of 12·40 per cent. for men, and 25·95 per cent. for women. Next after the metropolis, in point of the inferiority of the mean proportion of early marriages, stand the northern counties, taken as a group, namely, Cumberland, Westmoreland, Durham, and Northumberland; then Monmouthshire, and North and South Wales; then the remaining English counties, taken in groups, in the following order—namely, the south-western counties, five in number; the south-eastern counties, five in number; the north-western, two in number; the western counties, six in number; the north-midland counties, five in number; the three Ridings of Yorkshire; the three eastern counties; and, lastly, the south-midland counties, eight in number. The individual county next to the metropolis, in point of the smallness of the number of early marriages, is Devonshire.

The number of women married during their minority exceeds that of the men by 11,808, in the whole of England and Wales; and throughout the metropolis, in each of the counties, and in North and South Wales, without a single exception, the women maintain over the men a numerical superiority greater or less in this respect. A similar result in favour of the males over the females, it may be remembered, was

observable with regard to the inability to write, though the excess was not so remarkable as in this case.

The Registrar-General does not appear to have entered into any consideration, for which the marriage registers seem to furnish facilities, as to how far, if in any degree, the disposition towards early marriage, which we have seen manifests itself in such varied proportions in the different parts of England, may have been encouraged or affected by the absence of education among the parties married, so far as the inability to write, as shown by the marriage registers, may be indicative of such absence. This seems of much importance; and we ourselves have been at the pains to make a comparison between the two tables in the report, one of them showing the mean proportion per cent. of persons married under twenty-one years of age, and the other, the mean proportion per cent. of the persons married who signed the marriage register with marks; and the result is such as fairly to lead to the conclusion, that the disposition to marry early is in some degree influenced by the want of education, among other causes. We find, for example, that the eight counties of Bedfordshire, Huntingdonshire, Cambridgeshire, Hertfordshire, Northamptonshire, Essex, the West-Riding of Yorkshire, Staffordshire, and Wiltshire, wherein the disposition towards early marriage has been shown to prevail in the highest degree, are precisely the counties in which the want of education, as respects the inability to write, is proved by the marriage registers to exist in the greatest proportions among the parties married. And the same coincidence is more or less observable throughout the remaining counties, and especially is it remarkable with regard to the metropolis—Monmouthshire, and North and South Wales, forming almost the only striking exceptions.

AN AMERICAN BEAR-CHASE.

Mr N. P. Willis, in his very beautiful work on Canada, publishing at present in highly embellished numbers,* presents a variety of details on the field-sports of the northern settlers, and among others the following story of adventure in the pursuit of bears, which he quotes from Talbot's Travels:—

"One of my father's settlers, of the name of Howay, discovered the tracks of three bears on the morning of the 11th December; and, after following them for about three miles, came to the tree in which they had taken up their quarters. Having his dog, his gun, and his axe with him, he began to cut down the tree, the trunk of which was at least sixteen feet in circumference. Whilst engaged in this employment, he occasionally directed his eyes upward, to see if his motions disturbed the bears in the place of their retreat. He became at length weary of acting as sentry to the prisoners, and had nearly forgotten this needful precaution, when, in the midst of his hewing, a large piece of bark struck him on the head. This aroused his attention, and, on looking again, he discovered, to his great consternation, one of the bears descending the tree in the usual manner, tail foremost. Apprehensive that he might be attacked by his black friend, which he perceived was coming down with every appearance of hostility, he laid down his axe, and, taking up his gun, resolved to discharge its contents into the body of Bruin. Upon reflection, however, he desisted; for he was afraid, if he only wounded the animal, his own life would be the forfeit of his eager temerity. While he was thus deliberating, his dog perceived the bear, then only a few yards from the ground, and, by his barking, alarmed the brute so much that he ran up the tree with inconceivable swiftness. On arriving at the opening into the trunk, he turned himself about, and, looking down attentively, surveyed the dog and his master. Howay now regretted that he had not called upon some of his neighbours to assist him; but being afraid that if he should then go for any one the bears would in the mean time effect their escape, he rallied his courage, and, resuming his gun, lodged a ball in the bear's neck, which fortunately brought him lifeless to the ground. Victory generally inspires the conqueror with fresh courage, and is seldom the forerunner of caution. The conduct of Howay, however, affords an exception to a rule so generally acknowledged; for, instead of being elated by his success, and stimulated to pursue his conquest, he reflected that, although he had been thus far fortunate, the favourable issue was to be imputed more to casualty than to any particular exertion of his own prowess, and concluded, that if he continued to fell the tree, he might in his turn become the vanquished. He therefore very prudently determined to go home and bring some of his neighbours to his aid. Leaving the bear at the foot of the tree, he departed, and in a short time returned with two men, three dogs, and an additional axe. They soon succeeded in cutting down the tree, which, when falling, struck against another, and broke off about the middle, at the identical spot where the beasts lodged. Stunned and confused, the affrighted animals ran so close to one of the men, that he actually put the muzzle of his gun close to its shoulder and shot two balls through its body. The other escaped unhurt; and the dogs pursued the wounded one till he compelled them to return with their flesh badly lacerated.

By this time the winter sun had ceased to shed his refulgent beams upon that portion of the globe, and the men deemed it imprudent to follow the tracks until the succeeding morning; when Howay, accompanied by a person of the name of Nowlan, an American by birth, and of course well acquainted with the woods, followed the tracks, having previously provided themselves with a rifle, an axe, about six charges of powder and shot, and bread and meat sufficient for their dinner. This was early in the morning of Thursday the 12th of December. About two o'clock in the afternoon they were observed by some persons crossing the river Thames, nearly seven miles from the place at which they set off. This was the only intelligence we had of them for thirteen days. After they had been absent for some time, their friends concluded that they must either have perished with hunger and cold, or have been destroyed by the wounded bear. I was strongly of opinion that they had been frozen to death, for the weather was excessively cold, and they were slightly clothed, without a tinder-box, and totally unprovided with any means of shielding themselves from the inclemency of the weather. I therefore assembled a large party of the settlers pertaining to the townships of London and Nassouri, and proposed that we should stock ourselves with provisions for a few days, and go in quest of the two unfortunate hunters. To this proposal they unanimously agreed; and we set off on the following morning, provided with pocket compasses and trumpets, a good supply of ammunition, and the necessary apparatus for lighting fires, taking with us some of the best dogs in the country. In the interval between their departure and ours a partial thaw had taken place, which left not the slightest layer of snow upon the ground, except in low and swampy situations. We had therefore no tracks for our direction, nor any idea of the course which Howay and Nowlan had taken, except what we had obtained from the persons who saw them crossing the Thames on the day of their departure. We had no very sanguine hopes of finding them; but continued for two days to explore thousands of acres of interminable forests and desolate swamps, apparently untrodden by human foot, yet without the most distant prospect of success. We returned home, having given up all expectation of seeing them again, either living or dead.

Thirteen days had now elapsed since the departure of the two adventurous settlers, and all hope of their return had completely vanished. On the morning of Christmas-day, as I was in the act of sending messengers to some of Howay's most intimate acquaintance, to request them to take an inventory of his property, I was informed that he and his companion had returned a few hours before, alive, but in a most wretched condition. When I had recovered in some measure from my surprise, I went to see them, for I felt anxious to hear from themselves an account of their extraordinary preservation [which was as follows]:—

On the day of their departure, they pursued the bear, which took a north-western course for at least twenty miles, and at night stopped upon his track. With great difficulty they lit a fire, having contrived to produce a light by the application of a piece of dry linen to the pan of their gun whilst flashing it. Thus, before a good fire, they spent the first night, which was exceedingly cold, both supperless and sleepless.

In the morning they continued the chase, as soon as they had eaten a small piece of bread, the crumbs or fragments of their dinner on the preceding day. This was equally divided between themselves and their dog. About noon, when they had travelled on the track, through all its windings and doublings, for at least twenty miles, they were unable to distinguish the north from the south, and of course considered themselves lost in the boundless immensity of interminable forests. They resolved to pursue the bear no longer, conscious that it would lead them still farther into the wilderness, from whence they apprehended they could not without difficulty extricate themselves, for the snow was disappearing fast, and the rain continuing to increase. They now recollected that, in the early part of the day, they had crossed over the track of another bear, which they fancied would lead them to the settlements. This they unwisely resolved to follow, consoling themselves with the thought, that, if it should not conduct them to the abodes of man, it might lead them to the bear's retreat; and that if they should succeed in killing him in a spot even remote from any settlement, his flesh would afford them nourishment, and his skin a more comfortable couch than the snow-covered deserts on which they had bivouacked the preceding night. Hope, which—though it often bids desponding thoughts depart, and sometimes cheers us in the darkest hour—is too frequently the cause of our expecting where expectation is vain and disappointment ruinous, had, in the present instance, nearly precipitated its unfortunate votaries into the vortex of irretrievable misery. They followed on the track, until the snow completely disappeared, and the sky became so dreadfully overcast, that they were compelled to relinquish all ideas of hunting, and to think only of escaping from solitude and starvation. They were by this time on the banks of a small rivulet, the course of which they resolved to pursue, expecting that it would eventually lead them to the Thames, into which they calculated, as a matter of undoubted certainty, it emptied itself. On the banks of this rivulet they passed the second night, but were not able to get any sleep. It rained incessantly, and they suffered much from their exposed situation, for they were only partially covered with a few strips of bark.

On the third day they continued their journey down the brook, which, growing wider and wider, inclined them to think it was the head of some extensive river, and they hoped it would prove to be that of the Thames. The violence of the storm began to subside about noon, but without any abatement of the cold, or cessation of the rain, which continued to fall during the whole of the day. A little before sunset they fired at a partridge, but unfortunately missed it. Another joyless night found them waking in all its watches.

On the fourth day they felt excessively hungry and weak; their thirst also was insatiable, being compelled every five or six minutes to drink. In the afternoon, their hunger increased to such a degree, that they could have eaten any thing except human flesh. Sixty hours had now elapsed without their having tasted food of any kind, and the appalling idea of suffering by starvation for the first time obtruded itself. Before the close of the day, however, they succeeded in shooting a partridge, one-half of which they imprudently ate as their supper, and feasted on the remainder at breakfast the ensuing morning. Little more than one charge of powder was now left; and this they resolved to preserve for lighting fires, knowing, as the frost had again set in, that if they were exposed for a single night to the weather, without the protection of a fire, they must inevitably perish.

The fifth night proved extremely cold, and Nowlan perceived, in the morning, that his feet were badly frozen. Pitiable as their situation was before this heart-rending event, it then became still more wretched. This unfortunate man had now to endure a complication of unprecedented sufferings. To the imperative hankerings of hunger which he could not satisfy, a continual thirst which he could not appease, a violent fever which seemed not to abate, and the 'pelting of the pitiless storm,' from which he had no shelter, there was added a species of torment the most excruciating that human nature is doomed to suffer. Until this deplorable event, they had travelled at least fifty miles a-day, walking, or, as they expressed it, running, from before sunrise until after sunset. They were now unable to perform more than half their accustomed journey, and even that with the utmost difficulty.

On the afternoon of the sixth day, the sun appeared for a few moments, and convinced them that they were not on the banks of the Thames. The knowledge of this gave them much uneasiness, from a conviction which it impressed on their minds, that they were on the banks of a river which might lead them to the desolate and uninhabited shores of Lake Huron or Lake St Clair. Still they preferred following its course, hoping to discover some Indian settlement, which they could have no expectation of finding if they departed from its margin. Immediately after the sun had disappeared, they discovered a boat on the opposite side of the river, and, a little farther down, a canoe. The appearance of these vessels induced them to think that a new settlement could not be far distant; but when they had travelled several miles farther, and had not met with any other traces of inhabitants, they concluded that the vessels had been driven down the river by the ice during the late thaw, and had been stopped at the point where they were first noticed. They were just about to cut down some timber for the night, when they observed a stack of hay a few perches before them, and on their side of the river. The hay appeared to have been mowed on the flats, or shallows, where it grows spontaneously beneath the gloomy shades of the overhanging forest. This circumstance, when coupled with their recent discovery of the boat and canoe, convinced them that they were in the immediate neighbourhood of some settlement. The hay-stack afforded them a comfortable asylum for the night, and appeared to them the most enviable bed on which they had ever reclined.

On the morning of the seventh day, they rose much refreshed, having enjoyed, for the first time since they left home, a few hours of sound sleep. They were confirmed afresh, by the incident of the stack, in their resolution to keep close to the river, being elated with the idea that it would certainly lead them to some inhabited place. But their dog, the faithful companion of their dangers and partaker in their sufferings, was that morning unable to proceed any farther. When he attempted to follow them, he staggered a few paces, and then fell, but had not power to rise again. The hunger of the men had by this time increased to such a degree, that they could have eaten the most loathsome food; yet they desisted from killing the dog; they left him to die a lingering death rather than imbrue their hands in the blood of a fellow-sufferer. Scarcely had they proceeded a mile beyond the hay-stack, when they were intercepted by an impassable swamp, which compelled them to leave the direction of the river. Difficulties seemed to surround them on every hand, and success appeared to smile on them for a moment but to add to their other sufferings the pangs of blighted hope and bitter disappointment. They were compelled to wander once more into the pathless desert, with very faint expectations of regaining the river.

They walked a considerable distance on the eighth day, and at four o'clock on the ninth discerned the tracks of two men and a dog. They now imagined the long-wished for settlement at hand. With renewed spirit and alacrity, therefore, they pushed onward, indulging by the way the pleasing reflection, that the issue of the newly-discovered track would ere long terminate their woes, and bring them to enjoy once more the unspeakable pleasure of human society. Judge, then, what must have been their feelings, when, towards evening, they were brought to the very spot on which they had lain five nights before! Hope now no longer shed her delusive rays into their hearts; and they neither had a thought, nor felt a desire, to prolong existence.

After indulging in the gloomiest reflections for nearly an hour—during which time they both declared, that if a tree had then been in the act of falling on them, they would not have made any exertion to escape from its destructive stroke—they began to look upon it as their duty to employ the means which Providence had placed within their reach for the preservation of that life which He who gave possessed the sole right of taking away; and they resolved once more to light a fire. This they accomplished with the utmost difficulty, for they were so much debilitated as to be scarcely able to exert themselves in collecting a sufficient quantity of fuel. As they consumed the last grain of their powder in this operation, they became susceptible but of one emotion—that of indescribable horror, at the idea of being compelled, ere another night should elapse, to pay the debt of nature in a manner the most abhorrent to their feelings. They now conversed freely, but in a melancholy strain, on the method in which it was most likely that the frost would accomplish their destruction; and agreed in the opinion that it would first attack the extremities of their bodies, and gradually proceed up towards the vitals, until their hearts'-blood should become congealed to ice. After this discourse they lay down, almost unmindful of the past and careless about the future, endeavouring to re-

* London: George Virtue. 4to, with plates.

sign themselves to the fate which awaited them, whatever that might be.

On the morning of the ninth day of their deplorable wanderings, they arose in a state of perfect apathy, and began to traverse the same lands which they had so reluctantly trodden six days before. In the evening they arrived at the hay-stack, where they left the dog. They found him still living, but unable to get upon his feet. He was reduced to a mere skeleton, and appeared to be in the agonies of death. The desire of life once more took its seat in their hearts, and they resolved to seek diligently for some sort of food. Their appetites were now so unconquerably ravenous, that they stripped the bark off an elm tree, and devoured large quantities of its inner rind. Scarcely had they eaten it, however, when they became exceedingly delirious, and were forced to lie down among the hay, where they remained until morning in an agony of despair.

By daylight, on the tenth morning, they were much better, and would have arisen; but, recollecting that they now possessed no materials for lighting a fire, they resolved to roll themselves up in the hay again, and quietly await the hour of dissolution, whenever it should arrive. Their resolution had but just been formed, when they heard the joyful sound of a cow-bell, which seemed to proceed from the opposite shore of the river. They arose immediately, and, on looking over the water, perceived to their infinite satisfaction a log-house recently erected, but yet without any appearance of inhabitants. For some time they felt inclined to doubt the evidence of their senses, and to consider the log-house as a creature of their disturbed imaginations. They recollected passing that way before without observing any building; but, on calling to mind the circumstance of seeing the boat and the canoe, they were convinced that all was reality—delightful, heart-cheering reality! They therefore resolved, by some means or other, to ford the river; and, walking with feeble steps but bounding hearts along the bank, they soon discovered a crossing place. On arriving at the opposite shore, they were met by a white man and two Indians, who took them to the house of one Townsend, with whom they were well acquainted, and from whom they experienced every mark of attention which their wretched condition required. The heart of sensibility, if conversant with affliction, may form some estimate of their feelings at that moment. If a single feeling had then any marked preponderance over another, it must have been that of gratitude—boundless, unspeakable gratitude, to the protecting power of an Almighty and gracious Deliverer.

A few months previous to this event, Townsend had discovered a salt-spring on the banks of the river Sauble, and was at this time preparing to commence a manufactory of that article at a distance of nearly twenty miles from any human habitation. This embryo salt-manufactory was the building which Howay and Nowlan discovered after they heard the ringing of the cow-bell. It was a fortunate circumstance for them; for if this spot had been uninhabited, as it was a short time before, they must unquestionably have breathed their last on the banks of that unexplored river, which flows into Lake Huron, at a point which is nearly one hundred miles from any settlement. They were only thirty miles from the lake when interrupted by the swamp, in avoiding which they had inadvertently wandered back into the woods; and, on discovering their own tracks, returned unconsciously to the place where they had lain five nights before—a catastrophe which, at the time, they lamented as a dire misfortune, but which afterwards was the cause of their final deliverance.

At Townsend's house they were fifty miles from home, every yard of which they had to travel through the wilderness, but not without the aid of a blazed line to direct them. Nowlan's feet were by this time in a very bad condition; and as he could not procure at that lonely dwelling the materials necessary to prevent mortification, which he was apprehensive would very soon take place, he and his companion set off early on the following morning. Mrs Townsend kindly furnished them with provisions, and every thing necessary for their journey; and on the eve of the thirteenth day after their departure from the Talbot Settlement, they had once more the happiness of enjoying the comforts of their own firesides. So much for the pleasures of the American bear-chase!"

TWO OPINIONS, OR WHICH IS BEST?

In my native town in Lincolnshire, there resided a medical gentleman named Albright, and a worthy divine whom I must take leave to name Dr Doubtmuch: two beings more opposite in the cast of their minds could not be conceived. My father, bless him! being an easy sort of a man, allowed me to choose my own future profession, but requested that I would consult these two gentlemen, as he calculated that, in all probability, their difference of character would give me an excellent idea of the world, and some useful hints for my future guidance in it.

Unfortunately for my peace of mind, I met Mr Albright just as I was going to the house of Dr Doubtmuch, and related to him my plan, which was to become a teacher of experimental philosophy, that being, in my opinion, less laborious and more profitable than any of the three learned professions, and more gentlemanly than trade. Mr Albright stared as if he considered me an intellectual prodigy; and then exclaimed, in an enthusiastic manner, "Admirable plan! Pray, my dear Mr Weathercock, is it your whole and sole suggestion?—for really, sir," he continued, "it shows a greatness of mind, a profundity of thought, and a brightness of idea, that is truly surprising for so young a man." This hyperbole, which he used upon all occasions, was a delicious dose to my vanity. I was always lean and upright, like a hop-pole; but this extraordinary jargon made me seem to grow some inches higher.

Mr Albright was a smart bustling little man, with reddish hair, light grey eyes, and a murky, yellowish complexion. He was usually dressed in a dark green surtout, broad white-corded small-clothes, top-boots, a riding-whip under his arm, and his hat placed rather backwards, so as to make the most of his small head. He affected an appearance of great professional practice, until he ultimately made a very lucrative one. Whilst standing with me in the street, he bowed to every respectable person, even if they were merely passing strangers; for, as he observed at the time, "If they are not patients now, they may be, you know—ha! ha! ha!" This was the kind of man whose praise had quite intoxicated me. For, if I had not been blinded by my own excessive vanity, his glaring and palpable superficiality would have been apparent to me. But, in order to let you see the whole of Mr Albright's character, I must tell you that, before he left me on this memorable occasion, he told me "to take a large house in the vicinity of London, to publish an elementary treatise, no matter whether it contained a single original thought, and in this way obtain a reputation and a large fortune; and," said the little man, "I'll stake my ruby ring to a nut-shell, that you will become a popular lecturer, and gain an imperishable fame!" Such verbiage seemed, at the time, like spicy and fragrant zephyrs to my excited feelings, and I inhaled and relished the dose for its honied sweetness. The quantity was so potent, that it acted on my heart and brain, until my imagination revelled in all the anticipated joy of a well-lighted theatre, with crowded benches, and mine ears were greeted with the rapturous applauses of my ideal auditors. My good fortune seemed such a matter of certainty, that I did not bestow another thought on the worthy Dr Doubtmuch; and I should have declined asking his opinion, had not my good father urged me to do so; for, as he remarked, "the anti-phlogistic treatment of my reverend friend will allay your feverish symptoms, Tom, and restore you to a state of common sense."

As the peculiar character of Dr Doubtmuch will be developed in relating my interview with that gentleman, it may be as well now to advert to some minor points of it, and give some general idea of his personal appearance. Dr Doubtmuch was a very tall and stout man, with a ponderous head, and features exceedingly well defined; his mouth pouted out some inches beyond his fat double chin; his Bardolph nose had a most prolific appearance; and this noble member was overlooked by two full staring eyes, protected by very bushy eyebrows, overhanging them like the gable-end of a thickly thatched roof. Nature seemed determined to make this specimen of her handiwork quite symmetrical, although he was much above all ordinary-sized men. If the doctor stored his capacious head with intellectual matter, he did not forget to nourish his bodily organs. He had a great capacity for all things, whether consisting of the spiritual, subtle, immaterial properties of thought, or the substantial articles for eating and drinking. His walk every morning seldom extended beyond the market-place, where, with the nicest discrimination, he selected the dainties of the season for his dinner. He would then return and shut himself up in his study; and was surly and rude if intruded upon by any one. Persons desirous of having his advice, or to ask him some pecuniary favour, never ventured to visit him until an hour or two after dinner, when his better feelings were thawed and warmed into a state of cheerfulness by the many good things of which he had recently partaken. At such times he would be all civility to those who called upon him.

On the memorable evening on which I paid him a visit, he was sitting in a great arm-chair, and had been seemingly drinking more than his usual quantity, for he stared as if all did not appear quite clear before him; besides which, his tongue seemed rather too heavy to move, for he pointed to a chair, and nodded to me to occupy it. But I remained quite silent, until he asked me very laconically—"What do you want, Mr Weathercock?" I then did my tale unfold, to which he listened with seeming attention, until I unfortunately said "that Mr Albright admired my plan very much." At the mention of Albright's name, the eyes of the old doctor flashed with indignation; and, bending his head forward, like one who fancies he does not hear correctly, he bawled out with a stentorian voice—"WHAT!" Had it been a clap of thunder bursting over his house, or a musket-ball suddenly whizzing past my head, I could not have been more effectually startled from my seat than I was at the enraged "WHAT!" I actually felt a spasmodic action of the heart; and, when I recovered from the stupor it induced, I perceived an expression of extreme contempt written on the features of my censor. Yet I did not venture to say any thing, but looked rather timidly at him, and encountered his large full eyes, when he said, in an irritated tone, "Why, that puppy Albright will ruin you, Tom! I doubt much whether the fool knows the exact meaning of experimental philosophy." I then ventured to assure him that my friend Mr Albright was a scientific man, and practised in medicine and surgery. He replied, sneeringly, "You assure me, do you? Why, I doubt much, sir, whether you are competent to judge, or to give an opinion on the subject." These uncourteous remarks quite nettled me; so, taking up my hat, I pertly told him, that as my friends thought I possessed talent, it behoved me to try whose judgment was most correct. The worthy doctor looked at me with a countenance more in sorrow than in anger; and, pointing to the chair, bade me, in an authoritative manner, to be seated—an order which I could not help obeying. After a short pause he said, "It is out of respect to your family, Mr Weathercock, that I am induced to point out to you the absurdity of your speculation. For, sir, I doubt much whether, in a country so commercial as England, where the people are devoted to the mere acquisition of wealth, and the fortunate winners so fond of show and dress, even if you had the greatest talent for philosophical teaching, you would get a class to pay more than current expenses. You would therefore be sure to get into debt, compromise your respectability, and lose all relish for more certain means of getting money to pay your way as an honest upright man. It is a mistaken notion, my good sir, to think all *respectability* is confined to professions; for in very few instances do we find that professional pursuits are so lucrative as trade. Yet some would rather starve to be gentlemen, even at the hazard of integrity and independence, than be guilty of exercising some mechanical or handicraft occupation. They would think it a compromise of their gentility to go behind a counter; and yet they must often pander to the whims of a rich shopkeeper, and either keep their opinions to themselves, or be literally 'all things to all men.' Therefore, Tom, if, in opposition to the experience of observing persons, you follow the whimsical fancies of your own morbid imagination, it needs not the gift of prophecy to foretell the consequences. You will fritter away the greater part of your life in catching at unsubstantial shadows; your latter days will be cheerless and miserable; and your bosom companions will be poverty and disappointment, as they generally are the associates of the visionary adventurer." I sat quite motionless during the delivery of this powerful lecture, and I felt that the doctor, like a divine oracle, had pronounced my certain doom, if I persisted in my original design. Yet I could not reply to him, for a sickly faintness came over me, cold drops of perspiration trickled down my aching forehead, and my whole body seemed enveloped in a chilly, deathlike dampness, as if life was oozing away. It was not till some minutes had elapsed that I felt myself able to rise and take my leave.

Subsequent deliberation convinced me that the opinion of Dr Doubtmuch was the most prudent; and I resolved to follow it, though still grieving over the downfall of my once brilliant hopes. I selected a particular line of business connected with medicine, and gave it my undivided attention for a series of years. Ere life had passed its prime, I possessed a competency, with which I retired, and devoted myself to those scientific pursuits, which, if pursued in poverty, would undoubtedly have ended in the loss of my independence. I allow myself to be occasionally tempted to give a few lectures, in amateur fashion, to the good folk of the little town near which I dwell, and generally secure a fair modicum of applause. When, after these exhibitions, I descend from the rostrum, my respectable neighbours, ladies as well as gentlemen, flock about me, shake hands, and assure me they have had a great deal of pleasure in listening to my excellent lecture, &c. I more than suspect that it is pleasanter to be a lecturer on experimental philosophy as a gentleman of independent means, than as a young fellow seeking to make his bread and establish himself in the world.

SMALL COUNTRY NEWSPAPERS.

Some time ago we mentioned the appearance of several monthly sheets issuing from country towns in Scotland, containing local and general intelligence, along with advertisements, and some matter of miscellaneous interest. Not being newspapers in the proper sense of the term, they did not require to be stamped, and were published at the convenient price of one penny each. As they had a pretty extensive circulation in rural neighbourhoods, and in reality reached quarters where the ordinary products of the press never appear, it seemed to us that these monthly miscellanies were calculated to be of considerable service in the cause of popular instruction.

In consequence, it appears, of our recommendations on the subject, several monthly sheets were forthwith begun in England, and one in Ireland; and we now learn, with no small regret, that the latter has been extinguished by the interference of authorities connected with the Board of Stamps. This, we take leave to say, seems a most unwarrantable stretch of duty; and we feel the more entitled to call it so, when we learn that the Scotch and English monthly sheets have met with no molestation. Desirous only of promoting the dissemination of respectable literature, no matter in what form, we have looked into the act of parliament respecting newspapers, in order to see whether monthly sheets are liable to stamp-duty. The act, as is usual with such productions, is as unintelligible as it could well be made; still we pick out of it a tolerably definite assertion that papers containing news published at wider intervals than twenty-six days between consecutive numbers are not newspapers, and do not fall to be charged with duty. We, however, extract the entire passages from the act (6 and 7 William IV., cap. 76), defining newspapers and the rate of duty, so that each person may judge for himself:—

"For every sheet or other piece of paper whereon any newspaper shall be printed, *one penny*

And where such sheet or piece of paper shall contain on

one side thereof a superficies, exclusive of the margin of the letterpress, exceeding one thousand five hundred and thirty inches, and not exceeding two thousand two hundred and ninety-five inches, the additional duty of *one halfpenny*.

And where the same shall contain on one side thereof a superficies, exclusive of the margin of the letterpress, exceeding two thousand two hundred and ninety-five inches, the additional duty of *one penny*.

Provided always, that any sheet or piece of paper containing on one side thereof a superficies, exclusive of the margin of the letterpress, not exceeding seven hundred and sixty-five inches, which shall be published with, and as a supplement to any newspaper chargeable with any of the duties aforesaid, shall be chargeable only with the duty of *one halfpenny*.

And the following shall be deemed and taken to be newspapers chargeable with the said duties: viz.—

Any paper containing public news, intelligence, or occurrences, printed in any part of the United Kingdom, to be dispersed and made public.

Also any paper, printed in any part of the United Kingdom, weekly or oftener, or at intervals not exceeding twenty-six days, containing only or principally advertisements.

And also any paper containing any public news, intelligence, or occurrences, or any remarks or observations thereon, printed in any part of the United Kingdom for sale, and published periodically, or in parts or numbers, at intervals not exceeding twenty-six days between the publication of any two such papers, parts, or numbers, where any of the said papers, parts, or numbers respectively shall not exceed two sheets of the dimensions hereinafter specified (exclusive of any cover or blank leaf, or any other leaf upon which any advertisement or other notice shall be printed), or shall be published for sale for a less sum than sixpence, exclusive of the duty by this act imposed thereon: Provided always, that no quantity of paper less than a quantity equal to twenty-one inches in length and seventeen inches in breadth, in whatever way or form the same may be made, or may be divided into leaves, or in whatever way the same may be printed, shall, with reference to any such paper, part, or number, as aforesaid, be deemed or taken to be a sheet of paper.

And provided also, that any of the several papers hereinbefore described shall be liable to the duties by this act imposed thereon, in whatever way or form the same may be printed, or folded, or divided into leaves, or stitched; and whether the same shall be folded, divided, or stitched, or not.

EXEMPTIONS.—Any paper called "Police Gazette, or Hue and Cry," published in Great Britain by authority of the Secretary of State, or in Ireland by the authority of the Lord-Lieutenant. Daily accounts or bills of goods imported and exported, or warrants or certificates for the delivery of goods; and the weekly bills of mortality; and also papers containing any lists of prices-current, or of the state of the markets, or any account of the arrival, sailing, or other circumstances relating to merchant ships or vessels, or any other matter wholly of a commercial nature: provided such bills, lists, or accounts do not contain any other matter than what hath been usually comprised therein."

It will be observed from these passages, that there is no definition whatever as to what is meant by *news*. This is a serious deficiency in the act. As the case is, nobody can tell when an event loses its news qualification and becomes a waif of history. Say, for example, it is an account of a voyage in a balloon. Does it continue to be news beyond a week, a fortnight, a month, or a year? It may be news to somebody, but not news to somebody else—not news in Britain, but news at the antipodes. An event dead and gone in London, and which any body may use up at pleasure, is only coming into life at Sydney. Query, then, is it news at Sydney? Common sense says, "Yes, as respects Sydney, but not as respects us." But the act of Parliament is silent on the point, and thus a door is opened to dispute. Again, the act does not tell us what class of events shall not be considered news. According to common usage, accounts of scientific and literary meetings are not considered news, but accounts of meetings for other purposes are so. Now, there is not the shadow of foundation in the act for this partiality. But it is needless to say more on the subject. The existing act of parliament respecting newspapers is a mass of confusion, which we should be glad to see altered, so as to prevent all collision between the administrators of the law and those who are engaged in the honourable calling of disseminating information through the medium of the press.

BURNING AS A PUNISHMENT.

[From *L'Audience*, a French newspaper.]

THERE is scarcely a nation of the earth which has not, at some period of its history, used fire as a punishment. With the ancient Egyptians, parricides were punished by being burnt alive upon faggots of the pine-tree; and the Babylonians burnt their criminals in large fiery furnaces. The same kind of punishment prevailed among the Hebrews. With the Romans, also, criminals were burnt in a great many cases; and this species of execution was always carried into effect with great solemnity and much preparation. [In the middle ages], apostates from Christianity were likewise burnt; and heretics could be delivered to the flames by the bishop of the diocese alone, without the intervention of the synod. In the reign of Mary, a woman who was with child was burnt at Guernsey for being a heretic, and the moment the funeral pile was lighted, the fear and the pain together brought on premature labour. The spectators attempted to save the infant to which she gave birth; but the priests who were in attendance threw it back into the flames, in order that the "little heretic" should perish with its mother! Of all the civilised countries, Spain is that in which this mode of punishment—known by the name of *auto da fe*—has been most frequently applied. The number of unhappy victims whose ashes have been scattered to the winds by the tribunal of the Inquisition in that country is almost incalculable. The savage tribes of America yield nothing in this respect to the "*civilised*" nations. When a prisoner is condemned to death, they drive a stake into the earth, and fasten the sufferer to it. They then sing the song of death around him; and the savages having seated themselves in a circle about the prisoner, a large fire is then lighted, at which they make hatchets and other instruments red hot, and apply them to different parts of his body; others come and hack his body with their knives, while some will actually cut a piece of his burnt flesh, and eat it before his face. Some of them have been known to fill the wounds in the bodies of the victims with gunpowder, and set fire to it. In short, each of the spectators will torment the sufferer according to his caprice, and his agonies will last for four or five hours, and have been known to continue for several days!

In France this mode of punishment had continued to prevail from the earliest ages down to the year 1790; but it was in that period of barbarism and cruelty called "the middle ages" that this horrible punishment was most frequently applied. The legislators of that period were not content with avenging the laws and punishing moral outrages, but occupied their minds in extirpating heresy; and to that end burnt heretics by hundreds and Jews by thousands. This was the more horrible, as religion was only made the pretext. It was not for the sake of converting the Jews to Christianity that they burnt them, but for the base purpose of possessing their riches. The same motive may be traced in the punishment of the Templars; fifty-nine of whom were burnt alive in one day, near the Abbaye Saint-Antoine, Paris. Jacques de Molai, and Guy, son of Robert II., Dauphin of Auvergne, were also thrown alive into the flames on the 18th of March 1314, on the spot at present occupied by the equestrian statue of Henry IV. Two witnesses were brought forward to support the most ridiculous charges against them; but no one was imposed upon by the accusations. It was plainly enough seen that the only crime of the Templars was that of possessing great wealth. A greater number of persons were burnt during the fourteenth century than in any other period of our history, for heresies and sorcery. The parliament of Bordeaux, by its own authority, burnt more than six hundred in the space of one year. We may judge of the "crimes" for which they suffered by the case of Gilles Garnier, who was sentenced to be burnt by the parliament of Dôle, in 1374. It was charged against him that he had sold himself to the devil, who had changed him into a wolf, and that under this form he had devoured a number of little boys.

THE GLORY OF GOD IN CREATION.

[T. MOORE.]

THOU art, O God, the life and light
Of all this wondrous world we see:
Its glow by day, its smile by night,
Are but reflections caught from thee!
Where'er we turn, thy glories shine,
And all things fair and bright are thine.

When day with farewell beam delays,
Among the opening clouds of even,
And we can almost think we gaze
Through golden vistas into heaven;
Those hues that mark the sun's decline,
So soft, so radiant, Lord, are thine.

When night, with wings of stormy gloom,
O'ershadows all the earth and skies,
Like some dark beauteous bird, whose plume
Is sparkling with a thousand dyes;
That sacred gloom, those fires divine,
So grand, so countless, Lord, are thine.

When youthful spring around us breathes,
Thy spirit warms her fragrant sigh;
And every flower the summer wreathes,
Is born beneath that kindling eye;
Where'er we turn, thy glories shine,
And all things fair and bright are thine.

SONG.

[A. PARK, Glasgow.]

HURRA for the Highlands! the stern Scottish Highlands!
The home of the clansman, the brave, and the free,
Where the clouds love to rest on the mountain's rough breast,
Ere they journey afar o'er the islandless sea.

'Tis there where the cataract sings to the breeze,
As it dashes in foam like a spirit of light;
And 'tis there the bold fisherman bounds o'er the seas,
In his fleet tiny bark through the perilous night.
Then hurra for the Highlands! &c.

'Tis the land of deep shadow, of sunshine and shower,
Where the hurricane revels in madness on high;
For there it has might that can war with its power,
In the wild dizzy cliffs that are cleaving the sky.
Then hurra for the Highlands! &c.

I have trod merry England, and dwelt on its charms;
I have wander'd through Erin, that gem of the sea;
But the Highlands alone the true Scottish heart warms;
Her heather is blooming, her eagles are free.
Then hurra for the Highlands! &c.

WANT OF LABOURERS IN NEW SOUTH WALES.

IN a late number of the "Scotch Reformers' Gazette" (Glasgow newspaper) we find the following letter, addressed to the editor, written by one of the magistrates of New South Wales, who was, not long ago, it says, an estimable citizen of Glasgow, and on whose statements reliance may be placed:—

"*Sydney, August* 1, 1841.

Sir,—When your population at home appears to be suffering the greatest distress—when your industrious artisan and labourer, by the greatest exertions and economy, can scarcely keep want from their door—the question has often occurred to me, Then, why do they not come here? We require labour, urgently require it; for were a thousand immigrants to arrive here weekly, they would all be instantly engaged, so great is the demand. We cannot, in fact, procure a sufficiency of hands to carry on our operations, whether buildings, clearing ground, agriculture, or tending our flocks and herds. The cry, as you will see by the Sydney papers, from one end of the land to the other, is labour—give us labour. The government provides a passage, and the circumstance of your suffering population not being more anxious to embrace it than they are, appears to me almost a mystery. It can only arise from gross misconception, or want of information; for, as you will see by the statement which follows, the wages are most liberal, and a family, except in the case of children under twelve, instead of being a source of anxiety and expense, as at home, will here gain their own living, and lay the foundation of their future independence. While thus confidently assuring all who are willing to work that they cannot fail to obtain abundance both for themselves and families in this country, there are some things to which many have accustomed themselves before leaving their native country, which they need not look for, must not expect; for if they do, they will be disappointed. In general, immigrants will be placed in remote situations in the bush, where all old associations will be broken—where there is no alehouse to repair to—in which they must be all in all to themselves, and abandon old habits and old ideas, depending for their comfort and happiness on their own resources, not on external excitement.

With this precautionary statement, I will now proceed to lay before you the amount of wages received by labourers in my part of the country; and I may as well state, that they are somewhat lower than in some other districts. The food allowed to a free man weekly, is as follows:—Beef and mutton, 10 lbs.; wheat, 1 peck, or 12 lbs. flour; tea, 4 oz.; sugar, 2 to 3 lbs.; tobacco, 4 oz. A dwelling is always provided by the master, and the hours of work, deducting one for breakfast and another for dinner, are from sunrise to sunset—being in summer from five to six, and in winter from seven to five o'clock.

A ploughman,	L.25	to L.30	a-year.
A blacksmith,	50	to 60	..
A rough carpenter,	35	to 40	..
A shepherd,	25	to 30	..
A sawyer,	8s.	to 12s.	daily.

A brickmaker according to his work. This class can judge for themselves when I tell them 25s. are readily paid for 1000 bricks.

Grooms,	L.30	to L.40	a-year.
Cooks,	20	to 25	..
A female (ordinary servant),	14	to 18	..

The rations I have mentioned as being given, are in addition to these wages, and every encouragement is given to the servant to provide himself with a garden. He can there grow what he likes, but any luxuries he may require must be paid for. In the case of a man with a young helpless family, a larger ration of food would be allowed, and less wages; but the salaries are most liberal to the immigrant so situated; and the latter should remember, it is an evil which every day will make less.

Let me earnestly, in conclusion, advise my countrymen coming here to avoid the society of government men. In a few short years this infamous class will effectually be put down, and the labour of the immigrant preferred; but as it is impossible in the present state of the colony either for master or servant altogether to avoid them, the newly arrived should be put on their guard. Their whole employment seems to be, to avoid work and to plan thefts; and they are so linked and faithful to each other in their villanies, that it would require the ingenuity of a Bow Street officer to unriddle them.—I am, sir, your obedient servant,

A MAGISTRATE OF THE TERRITORY."

THE RAILWAYS IN 1841.

Having entered upon the new year, we have drawn up a few brief remarks upon the events of 1841, to which we beg to call attention. A co-operative system of forming new lines, by the combination of several companies, has been organised for the formation of the railway from Darlington to Newcastle. The question of low fares has made much progress. About 250 miles of railway have been opened. The number of companies paying dividends last year was 26, this year 38, increase 12. Number of companies the dividends of which have decreased, 1; increased, 13. Notwithstanding the greater length of opening, the vast extension of traffic, the greater number and proportion of dividends, such has been the state of the money market, that the shares, even of the best and most stable companies, taking the prices of the 18th of December in each year, have generally receded. The number of those which have increased in price has been 12; remained at the same price, 10; decreased, 28. The sacrifice in the value of railway shares stands thus:—

Increase on L.7,500,000,	L.730,000
Decrease on L.23,000,000,	2,400,000
Net decrease,	L.1,670,000

The net decrease in the value of railway shares this year, on account of the depressed state of the money market, is above a million and a half sterling, although the traffic of the railways has increased by that amount during the present year. The bulk of railway shares have decreased L.10 per cent.—*Railway Magazine.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 527. SATURDAY, MARCH 5, 1842. PRICE 1½d.

THE PHILOSOPHER'S STONE.

"WELL, that bates the *pyeramids*, Mister Colooney!" exclaimed Patrick Gallagher, turning the object of his examination this way and that in his hand; "resolve me this book, and Father M'Teigue may go to school to you!"

The reader must imagine two grotesque-looking fellows, on an unfrequented by-road in the west of Ireland, towards the fall of an autumn evening, busily engaged in scrutinising something they had just picked up. Mr Patrick Gallagher was one of about twenty partners who held a piece of land under one lease from the rich absentee Lord T——, and endeavoured to wring his share of the rent out of the wet side of a hill, with the comfortable reflection, that if any whim should induce him to become rich, he was to be visited for his presumptuous prosperity with demands from his landlord for the full proportion due by the less thrifty and more *Irish* of his copartners. Thus he felt that he performed the whole law by having a sufficient number of dirty bank-notes in his pocket at certain seasons to give the agent one half year's rent of his share within the other, so as to leave something always due; and accordingly, without a farthing on the face of the earth, and liable any day of the year to have his cattle driven or his crops seized, he was considered a respectable tenant by his landlord, and an independent if not a wealthy man by the neighbourhood and also by himself. He was, however, a *Connaught man;* and those alone who have crossed the Shannon are aware of all that is implied in that term. He was fidgetty, resentful, and grandiloquent—on wires, on thorns, and on stilts, all at the same time. His appearance was characteristic. The eyes of an observer, beginning their survey from above, first lighted upon a piece of felt, of the shape of a thimble, with a bit of whip-cord tied round the middle of it, as if to prevent it going farther down on the wearer's head than the point of his nose. In this office, indeed, it was assisted by his ears, which rose gracefully outside the brim, where the ordinary hat itself is wont to curl. His face was sharp, meagre, and cunning, with a chasm below, armed so as to resemble Fingal's Cave, and beset on either side with an irregular thicket of wiry red hair. A blue coat, interspersed with a few brass buttons, and built without much attention to the usual orders of architecture, served to connect the attic storey of this human edifice with a pair of leather small-clothes, that contracted like a backgammon-box half way down each thigh, but spread roomy for the knee-joint to play, disdaining buckle, button, or strap, and flapping against the top of a blue worsted stocking. This specimen of Connemara manufacture, which was gartered just above the swell of the calf, was *erased*, as heralds would term it, below, leaving the primitive leg again to "crop out" to the surface, till it once more dipped into the unfathomable *brogue*. Imagine a creature thus clad, with flat back and shoulders, knees bent and knotted, and heels extending back like a reserve of foot, ready to be put forwards when the other end was worn out—carrying a stick with the smaller end, polished with the "frequent palm," in his horny fist—and you have some faint idea of Pat Gallagher.

Mr Colooney was of a higher stamp. The first glance showed that his hat was or had been white, notwithstanding the discoloration of the weather side of it. The collar of a long trailing frock-coat was of velvet, of a time-worn green, as if it had begun to vegetate. His features were thick and stolid, his beard black. *He* had not only buttons at his knees, but long tape strings, tightening his hose over a bursting calf. He was of somewhat shorter stature than his companion, it is true; but what he wanted in height was more than made up in the dignity of his bearing, the manner in which his elbows were thrown back, and the determined rigidity of his knee-joint, which formed the key-stone of a backward arch at every step. Mr Colooney was no less a personage than the village schoolmaster.

"Well, by dad, Mister Colooney, but this bit of a shtoane's mighty like a book—the Lord save us!"

And like a *book* the thing certainly was that he had that instant picked up in the middle of the road, for it had a back with four projecting ribs marked across it, some show of *tooling*, as it is called, flat sides, and the place where leaves generally appear in books sunk the usual distance between the covers. *Stone* it certainly was, and polished stone, too—a very pretty bit of marble, with some "organic remains" visible at each side of it. In short, it was a very stony-looking book, and a very bookish-looking stone.

"But where's the use of a book that wont open?" continued Pat, musingly, as he attempted to force asunder the covers. "Shure, there's only one book that's any good, and it shut; and Father M'Teigue can open that same, an' sorra a more strinth in his bit iv an arm nor would rise a tum'ler to his mouth; but, by dad, this would defate him, or Father M'Hale himself, and small blame to them, when there's no inside to it at all at all!"

"Whisht, Pat," said Mr Colooney, with a sagacious wink, "how do you know that?"

"Arra, sir, who'd open a pair of flent covers?—ye might as lieve go look for writin' betune Thady M'Gusty's millstones. It's a shtoane book, and you can't resolve me it, with all your guagin', and surveyin', and alphabets! Well, what'll the poor childher do, I wondher, that's set at letthers as long as my shtick, when the masther can't read a book no bigger than the palm of my hand? Set Pat at it himself, an' he'll make somethin' of it, I'll go bail." With this, Pat sought to recover the mysterious stone, which Mr Colooney had taken from his hand in the course of the conversation.

But the man of the ferule was not inclined to part with it. He turned it on this side and on that, and from one hand to the other, and racked his brains for some solution of the riddle.

"It's a lump of a stone, that's sartain," he muttered, musingly, "and, by the same token, mighty like what's in Father M'Teigue's chimley-piece, with the little egg-shells and saws and rulers broke out on it like the small-pox. So a stone you are, says I, if St Patrick himself pithrified you. But then, again, you're a book, or I never seen the inside of a school-room. The bigness to a T of my own 'Univarsal,' and the place at the back where the name ought to be, and was wanst, maybe. It's a book, and it's a stone. Well, that's beyant me. Maybe the larned men in the ould ancient time 'id be spellin' out of stone books, afore readin' and printin' was found out—the ould filloshofers. By the blessed Vargint, I have it, Pat!" shouted Colooney at last, flourishing his arm round his head.

Pat jumped round, and opened his mouth.

"My fortune's made, Pat!—I'm the boy, afther all!" and the pedagogue performed a *pirouette*, finishing with a sprawling gambol high in air. "*The filloshofer's stone*, Pat!—*the filloshofer's stone!* Eh, Pat, isn't that it?" and he fetched another gambol.

"The fill—fill—the fill of a what?" demanded the anxious Pat.

"The filloshofer's stone, you fool! Usen't all the world to be going about in the ould times after the flood, with hammers in their hands, just like the gintlemen that was up the mountain the other day with the tin case, sarchin' over and under, and up and down, for the filloshofer's stone?"

"An' what was it to do for them if they found it?" asked Pat, his face writhing with curiosity.

"Oh, by dad, every thing. It 'id make them young (Pat twitched up the right leg with a half audible whoop), and comely (Pat leered modestly), and wise (Pat strove to render his face intellectual), and rich"——

"Och, by japers," cried Pat, "that's the shtoane for me! Rich! was it rich you said?"—here he executed a screech, such as Power alone could imitate, evidently showing that he considered all other qualities merged in this great one. "But mind," says he, laying his finger on his nose—"remimber, Mr Colooney, it was *me* that picked it up." So saying, he offered to relieve the pedagogue of his burden.

"Oh no, paudheen!" said the other, smiling, but holding the precious relic tight. "So you want to make out that it's *you* found out the saycret, do you? Didn't I resolve you the maning of it all? Didn't I hit on the grand *ar-cane'um*, as I was like to do, being the one that puts the larnint into your four brats, if they'd resave it; and bad luck to them, the spalpeens, it's the hardest-earned sack of cups, the taching of them four, ever I ate."

"You may go back to your boys, Misther Colooney," says Pat, "and hit upon what you plaise; but if you were the Kildare Sthreet man himself, you wouldn't make them pick up as much knowledge in a day as I did just now;" and he winked, by way of giving sauce to his joke.

"Well, Pat, there's somethin' due to you for finding what you couldn't miss; and so, Pat, I'll toss you for the stone. Will that do, Pat?"

"Oh, be aisy, Misther Colooney, if you plaise; there's two sides to a halfpenny. What sarvice 'id a small lump of a flent do to the likes of you? No—see here, now. If I make my forthin' out of the shtoane, d'ye mind, you'll be the betther by another sack of cups next Candlemas, and not a word about the keg of potteen undher the school-room flure. Is that a bargain? Wet your fist, my honey, and 'done!' says I. Give us the shtoane."

All was arranged. Pat went home with the "treasure-trove" in the crown of his hat, or rather on the top of his head, for crown his *caubeen* had none. Not a word could he say to his astonished wife and hungry brood, but "Wait, wait, darlints—you forthin's made. I'll set my li'l' houldin', and rise a male-shop in Ballymakeskin." But he kept the stone out of sight, as he had not quite made up his mind as to how he would proceed so as to realise his wealth in the shortest possible time. He thought the best thing to do at first would be to sleep on it. He had often dreamt of bags of shillings under a wall, and nearly undermined his hovel with digging for them; but "Bad luck to them," he used to say, "I never hit upon the right spot yit." Still it was in his dream he expected the stone to discover to him all its virtues; and he had no doubt but that the way it would do so would be by telling him *the right side of the wall* to dig for the bag. When night came on, he placed the piece of marble immediately under his right ear, and anxiously did he wait for the necessary preliminary to his dream to come; but whether it was the cold of the application to his face, or that a man seldom goes to sleep when he "pays attintion to it," I do not know, but so it happened that morning found Mr Patrick Gallagher still awake, and, moreover, groaning and moaning most piteously with toothache, and pain in his right jaw.

The next day the half acre was left to plough itself if it chose, and the little mountain nags evinced much satisfaction that their shoulders were not made acquainted with the wisp of straw that generally served to attach them to the plough. Pat would answer no questions, but was observed to go up the side of the hill with Mr Colooney, whose school was over unusually early that day. At this the red-headed rabble which burst from his door displayed tokens of delight as clearly as the nags, and much more audibly. That night Pat repeated the experiment, with this difference, however, that, having been made disagreeably acquainted with the properties of a stone poultice, he put some of the bedclothes (that is, a wisp of straw) between him and the making of his fortune.

Patrick Gallagher slept. As soon as he awoke, he shook himself, turned about his head, thrust his eye into the floor, screwed his forehead into a most sagacious disposition of wrinkles, and began to think.

"What did I dhrame of?" Thinking with Pat was a serious job. "What the dickens did I dhrame of?" he repeated, putting his hand mechanically to feel whether the book was "to the fore." "There you are, sure enough," said he, as he turned it in his hand; "but by this and that you might have made me remimber what it was you tould me while you were about it, or what good's in your saycret at all at all."

But it wouldn't do. The knowledge which had been afforded him in his sleep (for *that it had* he did not think of doubting for a moment) had disappeared like the stars with the light of the day, and Mr Gallagher was still as ill able to meet his landlord on the approaching gale-day as ever, nay, less so by the amount of what a fine day's farm work was worth at that season of the year.

For three days and three nights did this go on, and Gallagher was still completely swallowed up in his speculations. Towards the evening of the third day, he smote the leather which clothed his thigh. To explain this action, as fraught with meaning as the nod of the sapient Lord Treasurer, we will transport our readers a week forward in the history of Mr Patrick Gallagher, and beg of them to post themselves at the side of the door of his cabin about two o'clock in the day—that is, if they can find room, for they will meet a "mortial recoorse" of people flocking from all parts of the "mountain," far and near, and converging to the entrance of the aforesaid cabin. Do the magnates who may con these pages in the drawing-rooms of the metropolis know the full import of the term "cabin," as it is used to designate a human habitation in the west of Ireland? If it were only to do our duty towards our neighbour, we must endeavour to explain. As a certain tourist, in writing home a description of Alpine scenery, commenced by assuring his correspondent that a *glacier* was *not* a fellow in a paper cap, with a square of glass under his arm, and a bit of putty stuck in his fist—so we must begin by making our readers aware that they will *not* understand our "cabin" by a reference to a picture by Morland, or a description by Leigh Richmond.

A Connemara cabin is a sort of excrescence of mud, raised like a bubble out of a tenant's "houlding," and topped with a layer of straw, spread irregularly on a few rude rafters, over which some huge flat stones are laid, to prevent the whole concern from flying off into the Atlantic the next equinox. This "mud edifice" is surrounded by a floating mass of putridity, consisting of whatever may be gathered or suffered to accumulate, to be spread over and fertilise the land at the proper season, and of which the least offensive materials are decayed straw and stagnant water. This moat environs the house on all sides, except where one narrow, broken, and half-submerged causeway conducts to the aperture through which an entrance may be effected. With considerable stooping this may be done; and then, if the fire happens to be low, you may have a sufficiently clear atmosphere to look about you. You perceive that the domicile is divided into two compartments, the fire being in that which you first enter, screened from the door by a great mud buttress. There may be some borings here and there in the walls, like so many feeble efforts of the inmates to *scratch out* for light; but the greatest quantity of that commodity is admitted by the hole in the roof, in return for the smoke it lets out. A few three-legged stools, a D-shaped griddle, a table like a chopping-block, and some musty straw in the corner of the inner apartment, are nearly all the necessaries. A piece of broken mirror, looking as if it had been worn into holes with having been so long looked at, a dresser of crockery, apparently the relics of an earthquake, an odd flitch blackening in the chimney, and a coloured print of some anonymous saint, skewered into the mud wall, constitute the refinements of the establishment. For inhabitants, these consist of the father and mother, and their innumerable offspring, which seem to descend by insensible grades into the pig, curdog, and chickens, with which they habitually consort—so that it is difficult to say where humanity ends, and pig begins; while an old crone for ever cowers in the chimney, by the few sods of lighted turf, like the genius of poverty incubating over her heterogeneous brood.

Now, readers all, gentle and simple, that we have introduced you to an Irish "cabin," you will perceive that when we placed you at the side of Pat Gallagher's door, we allotted you a more disagreeable position than you were aware of.

On the day in question, as hath been already related, this door was beset with people of all ages, sizes, and sexes, who seemed determined to take the castle by storm, so eagerly did they press towards its gate; but here they met with an obstacle in the shape of the commander of the garrison, our hero himself, who stood in the door-way with the alpeen already described in his fist, and opposed without scruple knocking-down arguments to their farther advance. No one was to enter—no, not the priest of the parish, Father M'Teigue himself, without "paying his footing." A penny a-piece for a sight of the *rale fillosho-fer's stone*, the book that dropped out of the skies one day that the blessed St Patrick was reading it, and let it fall out of his hand; "and sorry he was," said Pat, in his notice to the neighbourhood, "that he couldn't demane himself to come down and pick it up; but since he daren't do that, shure he pointed to it with his crook and I passin' by, and 'Pat,' says he, 'it ll be the makin' of you; but, mind you, don't let it out of your hands, but bring it up safe to me when you're comin' yourself, you know; and if it isn't *this way* you'll be comin', jist hand it over to Misther Colooney there beyant at the school-house forenenst you, and he'll take charge of it;' and with that the blessed Saint took off his specs, and 'Good mornin' to you, Pat,' says he, quite genteel, and up into the skies with him again, to the tune of *Patrick's day in the mornin'*."

All this spread like wildfire, of course, and not on *Tribute-Sunday* were pence in greater requisition than on that day of wonder and excitement.

"Now," said Mr Gallagher, apostrophising himself as he took his post at the door—"now, Pat dear, show yourself a man. There's young Hoolaghan and Larry O'Dowd 'ill be for breakin' in past me for nothin', I'll be bail. But sorra one of them 'ill do it without the prent of this bit of a shtick on their shkulls first. This is the way I'm to make the forthin', that's plain; and by the help of the blessed Vargint, I'll not be chated out of a pinny of it. Dhrame indeed! I hot upon it broad awake;" and again he smote his thigh.

By two o'clock the concourse was great, and Pat had some difficulty in regulating the admissions. "Oh, Misther Reilly, an' is that you all the way from Curnavooleen? The sight of ye's good for sore eyes—walk in, an' welcome—och, not at all; do ye think I'd be afther chargin' the likes of you, that I'm proud to see at all times, let alone this present? Keep your coppers towards drinking my health—only, plaise God, I'll be thratin' you myself, when the forthin's made. Blur an' owns, Phelim, but you're the welcome boy! I was thinkin' you had another month in *Monaghan* yet. You jist got out in time for a sight of the shtoane. Are you goin' to make all right wid poor Molly?"

"Och, that's all over," answered Phelim, "and Molly's as honest a woman as any in Connaught."

"In with you for nothin', my darlint!" exclaimed Pat, in a transport of moral enthusiasm—"in with you, and —— Oh, by japers, but here's Larry O'Dowd sure enough. Well, Larry" (he said this in an altered tone), "I'm proud to see you." At the same time he placed himself in the middle of the door-way, and grasped his bit of oak by the middle, prepared to guard to the uttermost the approach to the shrine of wonder.

Larry lounged slowly up, with his hands in his breeches pockets, turning his head here and there, with a look between cunning and *nonchalance*. As the loiterers who had no pence expected a row, and hoped to take some advantage of the confusion, the causeway was left clear for the belligerent power to advance. He did so—and held out his hand.

"Pat, my honey," said he, "give us thee fist—there' your ha'pence, an' I'd give a naggin into the bargain to get a sight o' the blessed Sia Fail that I'm tould you've got back from St Pether."

Gallagher burst into a hideous yell, which in the polite world would have been termed melting into tears.

"*I* wronged you!" he sobbed—"I wronged you! But, by my sowl, no man shall say that Pat Gallagher was bate at that game. In with you, Larry, and *mille failte*; and for the matter of your pinny, there's small Terry with the shkull-cap 'll be blessin' you for ever for the half of it. Terry, you blackguard, what's keepin' you?" and he bestowed a hortatory box on the bandaged ears of the urchin.

Hereupon Terry's face silently writhed out of every resemblance to humanity, becoming gradually black through every shade of red and purple, till at last, after a lapse of time sufficient to have suffocated a diver, a roar burst forth, which was only moderated by being too vast for the dimensions of the imp's throat.

"Here, my jewel," said Larry, apparently melted by this affecting demonstration, "away with you to your mother, and tell her who was helpin' you."

The urchin, as soon as he felt the money in his hand, and without ever looking up, at once trotted off barefoot over the stones with a light step, but maintaining at its height the stentorian roar which had helped him to this bit of good fortune, as if afraid that any intermission might deprive him of it again. Larry entered the hut, and Pat once more resumed his position. Three or four friends dropped up, and he showed the same magnanimous scorn of gain which had influenced him in the cases we have selected for special mention; a bright eye or a tight ankle his gallantry forbade to pay toll, and the consequence was that his house was filled considerably before his pockets. Now, however, the crowd outside began to thicken, and to become urgent. Persons, known to have no pence, affected to be pushed from behind by those who said they had, while the hubbub from within sufficiently evidenced the tightness with which the "admitted few" were packed, and the difficulty those nearest the door had of gaining a sight of the wonderful object of attraction. Pat was now forced to exert himself. The shillala was brandished in a menacing manner, and, after two or three "demonstrations," finally brought to bear with effect. Whop went the tough oak on many a tougher head, Pat exclaiming all the time, that he was determined not to let in more than "the full of the house" for any man. While he was thus engaged, however, a sudden rush and shout from within turned his attention the other way. So while some boy is busy cramming greasy tarts, a gripe from the visceral regions recalls his senses from the uneaten portion outside his mouth to the eaten and half-digested load within. He pauses—and turns the eyes of his soul back upon himself. But Mr Gallagher did more. He quitted his post at once, and plunged from the door into the presence of the precious stone; and here our illustration deserts us, seeing it would be next to impossible for the self-indulgent school-boy to jump down his own throat to discover what the greasy tarts were about. It was manifest in a moment. Larry O'Dowd—to his shame be it spoken—no sooner had squeezed within arm's length of the relic, than he snatched at it, unmasked a battery in the shape of a short thick stick he had concealed about him, in a twinkling knocked down two women and a man who were next to him, and had nearly reached the door, which he expected to have "bolted" in a sense different from the usual one, when he was confronted by the might of Patrick Gallagher himself, the hero of our tale. As may be imagined, they did not begin, like Glaucus and Diomed, to recite their pedigrees, but at once set about their principal business. Larry lay sprawling and bleeding on the ground, until the stone was wrenched out of his grasp; but no sooner was he relieved of this burden than he started up on his feet, and ran straight out of the house and across the hill, as fast as his legs could carry him, the assembled crowd shouting after him as if he had been a hare, and Pat bellowing above them all—"My blessin' on you, Larry O'Dowd!—when'll you be back? Come here, man, till you see the inside of it." Then, turning to the grinning bystanders, he continued—"I hope he hasn't taken the vartue out of the shtoane, for he wanted it badly. By japers, if it's back he'll be comin', I'm thinkin' he'll shtay about as long as a drop uv water on a hot smoothin'-iron." He then returned into the house, barred the door, and told the good woman to produce the keg of poteen; "for," said he, "shoutin' and door-keepin's dhry work." Out came the secret store, accordingly; the *earthquaken ware* was set upon the table, and soon the huzzaing and laughter betokened to those without that the illicit spirit was getting as little law now as at its making.

At length a tap was heard at the door. In towns we know a postman's knock from an attorney's, a footman's from a dun's. Pat's heart smote him, for there was something peculiar in the tap; it was a

tap as with authority—like a certain tap on the shoulder. Again—tap—tap; Pat's heart smote in echo against his side; he groaned, and went to the door.

In every one's experience there are a few faces the eyes would wish to look upon as seldom as possible. One of these "few faces" Pat beheld as he opened the door.

"Why, Gallagher, what do you mean by all this? What are these lounging fellows about at this time of day? I hear you pretend to have found something of value; if it *really be* worth any thing, you know whose it is, I presume?"

It was Lord T——'s English agent.

The men inside looked as if they were before the high altar, while the women fell on their knees and began to bless him.

"You're humbly welcome, your worthy honour," bleated Pat, in his most reverential tone, while he wished him in his secret heart—any where but where he was. "But sure it wouldn't be for the likes of your honour to be intherin' the bit of a kitchen, an' it full of bits of common boys an' girls—(for Pat quaked for his stone). It's only a bit o' good luck that's befell me, your honour; an' it'll be helpin' to make up the li'l' taste of a rint agin next November, plaise God."

"Come, come, sir," said the agent, entering, "I must judge for myself. I will not have such assemblies of idlers on the estate without taking measures to —— Why, what have we here?" and he stopped short, as he came within sight of the stone. "Is THIS what you've found?—*The specimen of Armagh marble I dropped the other day out of my gig!*" So saying, the inhuman man actually laughed aloud.

At these words Pat jingled the money in his pocket, to discover how much he had realised. It amounted to thirteenpence.

Mr Colooney, we are informed, did not ask for the additional sack of cups at Candlemas, inasmuch as he did not get one at all. In fact, there were no cups to get.

We fear, brothers of the pen, that some of us are very much in the position of our friend Patrick Gallagher. While we fancy, in striking out an article, or hitting off a stanza, that we have found the Philosopher's Stone, we let the fields of utility lie fallow, and encourage idleness and irregularity. The consequence is, that whether our rent be due to a landlady in a by-street, or at the exchequer of our country, we are equally unable to meet the November demand—and as we cannot be just, so we cannot be generous, and Colooney never gets his cups.

Chafe not, knights of the inky plume, at this bit of application. You will perhaps be ready, with the old image, and complain that, in an attack from a brother scribbler, you are wounded by a shaft winged with a feather *from your own breast*. Recollect, however, ere you make the case your own, what that weapon is—*a goose-quill*.

POPULAR INFORMATION ON SCIENCE.

WATERSPOUTS.

THE most common appearance of a waterspout is as a circular pillar extending between the sea and a cloud above, and composed of water which seems to have been sucked or spouted up from below. Sailors are accustomed to see them stalking along over the surface of the sea, and sometimes have been involved in the midst of them. Professor Oersted of Copenhagen has recently given the phenomenon a studious attention, and announced some new views on the subject in a scientific journal.

According to Oersted, the object is not rightly named, water being only an accidental feature of it. The phenomenon is fundamentally a whirlwind, or vortex in the atmosphere, which only draws up water when it happens to pass over a sea or lake. The Danish professor, defining it as "a strongly agitated mass of air, which moves over the surface of the globe, and revolves on an axis, one extremity of which is in the earth and the other in a cloud," thinks that the term "storm-pillar" would be more suitable.

A waterspout, or, to adopt the improved name, storm-pillar, usually appears wide at the top and bottom, and narrow in the middle. The upper portion being always dependent from a cloud, the height may be presumed to be more considerable than observers have commonly believed. The altitude of 2000 feet has been that most frequently assigned to them. It seems more likely that the visible portion of them is often from 5000 to 6000 feet in height, though, in this respect, considerable variations must exist. In point of diameter, the lower portion has been found to measure from one hundred to above one thousand feet. The marks left on the earth, however, occasionally indicate a diameter smaller than a hundred feet. The colour of storm-pillars also varies much, the majority being grey in appearance, while others are of a dark blue, a dark brown, or a fire-red tint. They assume, in fact, all the hues taken by the clouds in different states of illumination; and the hue of the substances which they take up, as dust or water, must always greatly modify their appearance. The middle part of the pillar, when over water, is transparent; when over land, it is opaque.

The larger these vortices or revolving pillars are, the longer they endure. For the most part, they do not last above half an hour, and usually travel at an uncertain rate during that time. In some cases, they have passed over thirty-seven English miles in one hour; at other times, a person on foot can follow them easily; and occasionally they remain nearly stationary, for a greater or lesser part of their duration. Their course, again, though most commonly in a straight line, is not unfrequently zig-zag, and they often rise and fall, quitting the ground for a few minutes to return to it again. The rate of motion of the pillar on its own axis is also very variable—sometimes extremely rapid, sometimes comparatively slow. Some persons speak of having observed ascending and descending movements, and spiral windings, in the different parts of the pillar. When the onward and revolving motions are both violent, the power of these storm-whirls is very great. They have moved heavy cannons, and torn up large trees, carrying the latter to a distance of several hundred (in one case 600) feet. Roofs of houses have been wrenched off by them, and large beams cast to a distance of 1400 feet. A log of wood, with other matters, the whole weighing 500 pounds, was lifted on one occasion from the ground, and thrown over a house forty feet high, to a total distance of 140 feet. A small object, such as a letter, has been carried twenty English miles. A fish-pond has been emptied in an instant; and the harbour of Christiansöe was once swept out so fully, that much of its bottom lay bare. Beyond all question, the showers of frogs, fishes, seeds, and other small bodies, which occur not unfrequently, are to be ascribed to the elevating and transporting powers of the storm-pillar.

As these atmospheric movements occur most frequently at sea, may reach a great height, and generally pursue one direction with violence, we need not be surprised that light bodies should be transported to considerable distances, without the elevating cause being noticed. The storm-pillar is accompanied by noise in most cases, and at sea, a roar has been sent forth like that of a waterfall, attended also with piping or whistling sounds. A sulphurous smell has also been felt at times. The sea, the sea-coasts, and tropical climes, are the localities most frequented by the storm-pillar, and almost always electrical phenomena are found occurring simultaneously with it. Storm-clouds are frequently seen before it, and great storms usually follow its appearance.

It has been mentioned that the upper portion of the pillar is connected with a cloud. In that cloud the pillar has to appearance its origin. One philosopher, indeed, M. Michaud, who had an opportunity of watching several in the harbour of Nice, declared himself able to observe their gradual origin in the surface of the sea; but he had been deceived by the fact, that the whirl of air which forms the pillar is not visible till impregnated with vapour or drops of water, which it raises, slowly at first, into its lower extremity, from the surface of the ocean. At the commencement of this process, a small circular portion of that surface is seen to be uneven, and somewhat darkened. Soon after, a pillar of water rises, in which is seen a violent internal movement, the height being several fathoms. It foams and produces drops of water above, which it scatters on all sides, so that it distinctly exhibits an ascending and descending course, which moves in parabolic curves, like jets of water ascending in a slanting direction. In the highest region, the mass of cloudy vapour assumes the form of an inverted cone, and the part joining this to the actual water below is transparent at sea. There can be little doubt, however, of the continuous agitation and revolution of the air from cloud to sea; but the moving air is seldom visible, having no vapour carried so high as to betray its motion. Sometimes the mid part resembles a thin cloudy streak.

The origin of a storm-pillar on land is not otherwise visible than as regards the gradual dipping of the cloudy cone above. But the effects of the storm-pillar on land—of the whirlwind, in short—are soon made not less apparent, in well-marked cases, than when the air has raised water into its vortex. The nature of the motion, the power displayed, the mode of displaying it, and the connexion with the sky, are in both cases so exactly alike, as to prove that the whirlwind and the waterspout are intrinsically one and the same phenomenon—a revolving pillar of air, namely, acting in different fields. For proof of this, indeed, we should require no more than the simple fact, that when a previously dry whirlwind meets a fish-pond in its way, it licks up the waters with the same facility evinced by the water-spout in raising the contents of the sea.

The old and yet very general idea that a waterspout was an ejection (or spouting) of water from the sea, is therefore utterly erroneous. There is no cause connected with the earth's crust, by land or by sea, that could account for the phenomenon. It takes place alike in non-volcanic and in volcanic countries. Nor can the sea itself, by any explicable mode of action, be the cause of such an effect; and as little can we ascribe it to the ordinary winds on the earth's surface, since it most frequently occurs in the midst of an atmosphere at the moment serene. The storm-pillar must therefore have its origin in the upper regions.

As a necessary consequence of the rotatory motion, all the parts exhibit a centrifugal action towards the circumference. Any person taking a transparent vessel filled with sand and water, and giving it a quick rotatory motion on a perpendicular axis, will see the heavier portions thrown to the outside. They may also be observed to pass upwards, exemplifying another feature of the storm-pillar phenomenon. The agency which drives the large sand particles outwards, finds a bound or check at the circumference, and the only direction which they can take under the influence of the pressure is upwards. This action may be further illustrated by emitting smoke into the open air, and, at the distance of one or two feet, producing a rapid rotation in the air, when the upward extension of the whirlwind is shown by means of the smoke. Here we have the elevating power of the whirl or vortex in part explained and illustrated.

All the phenomena indicate a whirlwind which begins, not on the earth, but in the higher regions of the air, and becomes expanded as it descends, till contact with earth or sea develop its influence. Whence originates this vortex? It is known that two currents of air, following parallel but opposite courses, can produce a slight species of whirlwind on the surface of the earth. There is nothing to prevent us from assuming the existence of such currents in the higher regions of the atmosphere. We know that currents, running in various directions, and also whirling clouds, have been found in the upper strata of the air by aeronauts; and we also know that these often exist and contend with one another when all is tranquil below. That the vortices of whirlwinds and waterspouts have such a source, is partly confirmed by their frequently oblique character, showing that the contending winds above may not be precisely in the same courses at all times when they produce the phenomenon. Great wood fires in the open air have been found to produce vortical columns of smoke and flame, having all the characters and powers of the whirlwind. Trees of considerable size were raised by them to the height of forty or fifty feet. These vortices were formed in calm evenings, and they appear to have resulted from the collision, under peculiar circumstances, of currents formed by the fires. The phenomenon tends to explain the liability of calm or tropical latitudes to become the scene of storm-pillars.

Storm-pillars, as already stated, are always attended with electrical action. Light, and noise, and smells, accompany them, as in the case of lightning and thunder. The rapid condensation of moisture, which develops electricity, is doubtless the chief cause of its appearance in the case of storm-pillars. Some people have explained their whole phenomena by supposing in them the existence of a strong electrical current, which received its vortical movement through the magnetism of the earth. One argument is sufficient to overturn this opinion. Such an electrical current could not but affect violently the magnetic needle. Now, storm-pillars have passed close to and even over vessels at sea, without any affection of the needle being noticed.

ANECDOTES RESPECTING A TRAIT OF AMERICAN CHARACTER.

THERE are few traits more strongly marked in the every-day American character than that of distrust or suspicion, which particularly displays itself where parties happen to be interested in pecuniary matters. It is observable in the merest trifles; and even children are instructed to be on their guard lest they should suffer themselves to be duped or imposed upon. It is a melancholy reflection, that, among a people of intelligence, it should be considered necessary to imbue the infant mind with a generally entertained suspicion of the whole human family: other nations have considered it better for the interests of virtue and happiness, that the tender and susceptible mind should not thus early be taught to think ill of mankind, though at the risk of occasional loss from want of due caution. I shall here advert to one or two instances of juvenile distrust which have occurred within my own observation, in the course of a pretty long residence in America. One day I had called at the house of an intimate acquaintance, to ascertain if I could execute any little commissions for the family in a distant city to which I intended setting out in a day or two. After the parents (for there was a family of children) had explained to me how far they would avail themselves of my kind offer, a little boy, of not more than seven years of age, expressed a wish that I would purchase for him a small cane fishing-rod. I then inquired of the father if it was *his* desire that I should do so? "Oh, yes!" replied the indulgent parent, "if he wishes it; but," continued he, addressing the child, "if Mr —— is to procure for you the fishing-rod, you had better go to your mamma and ask her for a dollar of your money, which, probably, will be about the price of your rod." After a moment's reflection, the little fellow, looking his father steadily in the face, said, "Why, I guess, papa, it would be better not to give Mr —— the dollar until he returns with the fishing-rod, for you know he may never come back; or he may break it before I get it; or he may lay out the money in something for himself." The parent listened and smiled, but neither rebuked his too cautious son nor attempted to enforce his own previously expressed opinion.

On one occasion I was on a short tour through the country in company with Judge T——, an elderly Scotchman, who had been settled many years in that district, and whom, in the absence of a fitter person, the governor of the state had appointed to the situation of associate judge, with a small salary. On our road the judge informed me that there was a farmer he wished to see for a few minutes on some business of no great importance, who resided, he believed, somewhere near the spot where we then were. By and by

we came to a farm-house where two or three children were playing by the roadside, among a parcel of chips and pieces of timber split up for fuel. The eldest, a boy apparently eight or nine years of age, was asked by the judge "if Mr R. lived there?" The young republican did not make an immediate reply, but looking first at the one and then at the other children, addressing my companion, said—"I guess you be the man as came after father a few days back." While this was being delivered, a little sister sneaked slyly off towards the house, as if to give warning to the inmates. Notwithstanding the boy's unsatisfactory answer to the judge's question, we took it for granted that we had hit upon Mr R.'s abode; so he again addressed the boy, saying, "Is your father at home, my child?" After a little consideration, the cautious urchin said—"Last night father was a-saying that he guessed he was a-going to mill to-day; did you notice, as you came along, whether or no the mill was a-grinding?" Without holding any further communication with this young scion of "freedom and independence," the judge rode up to the door of the dwelling, and hollooing pretty loudly, the farmer's good dame made her appearance, when he inquired if her husband was at home. After a moment's stare at him, she exclaimed, addressing the little girl we had noticed sneak off to the house, "Why, now, my gracious! Parthene, child, where be ye?—why, this man's no more like Sheriff Bates than you be; run—tell your father that it aren't the sheriff, any how;" and away toddled the little girl into some corner, where the farmer had secreted himself, on the false alarm being given that Sheriff Bates was approaching; for it seemed that a second visit from the sheriff of the county was hourly expected, in consequence of the non-payment of the costs incurred in a foolish lawsuit.

It ceases to be a matter of wonder, that children, educated, as it were, to be cautious and distrustful, should grow up with those feelings strengthened and matured with their riper years. In the ordinary business of life, a due caution and circumspection are always commendable; but these may be exercised, for the most part, in a fair and honourable manner, and without necessarily offending the feelings of the relative parties. In America it does not seem to be considered essential to attempt any little amiable disguise where you have a doubt that all is not correct; and yet business is commonly done in a round-about way, because it either is not in the nature of the people, or, at all events, no part of their education, to go directly into any transaction at issue at once. I have been a witness to very many instances of this peculiarity, some of which applied individually to myself, others to persons with whom I was intimately acquainted.

On one occasion, a friend of mine commissioned me to call upon the agent of one of the largest landholders in that part of America, to receive for him the sum of one thousand dollars; the said agent having previously been advised that he was to pay that sum to my friend or his order. My friend addressed a note to this individual, of which I was the bearer, requesting that he would pay the said sum to me (at the same time stating that I was his friend), as it would save him the trouble of riding over himself. I was then almost a stranger in that part of the country, and had never been in the village where the agent resided, neither had I ever seen him. When I called at his office, I found him disengaged; so I presented my friend's note without any circumlocution. He perused it, and then inquired, if I had left my friend, Mr W——, quite well, and if I had seen him lately. To the latter part of the inquiry I remarked, that the date of the note would probably be a satisfactory explanation, as it was, I knew, written that morning. "I calculate," said he, "that you are a stranger in those parts; have you long been acquainted with Mr W——?" I observed, that I was quite a stranger at Chinango, but that I had known Mr W—— intimately for some years. Having hemmed once or twice, and spat upon the floor as often, he carefully perused the note a second time, when he said, "Why, a thousand dollars is rather a large sum; I feel somewhat curious to know what Mr W—— can want with so much cash just now." I told him it was out of my power to inform him; all I knew of the matter was, that, knowing I was about to visit Chinango, my friend had requested me to receive the money for him; and if he (the agent) did not feel satisfied, and refused to comply with the order I had brought him, I must wish him a good morning. Looking again at the note, which lay beside him, he said, "Now, I declare, that Mr W—— is a quick hand with a pen; this is regularly like nobody's writing but his own; you've often seen him write, mister, I calculate?" At last, getting a little out of patience with my interlocutor, I told him, that I had other business to attend to, and could not spend the whole morning in listening to observations that I considered quite uncalled for; that if he chose to hand the money to me I was prepared to receive it, but if not, he was, of course, at liberty to do as he pleased. "Why," said he, "a thousand dollars, I guess, require a little looking up; so, as you seem to be in considerable of a hurry, I presume you might as well call again in an hour or two." Suspecting that my taking back the money with me might be a convenience to my friend, I judged it better to comply with the terms of the cautious agent; so, at the appointed time, I called at his office, and again found the gentleman disengaged. He again scrutinised my person rather closer than I approved of; and was about commencing cross-questioning me respecting my friend and my own business and connexion with that part of the country, when I cut him short by telling him, that I could not see what such questions had to do with the business I had called about, and that, if he did not feel disposed to comply at once with the note I had delivered to him in the morning, I should instantly take my departure. "I guess," said he, "mister, you ben't a Yankee, you get so considerable sharp in talking over business matters a little, which I consider no more than altogether regular. To be sure, I have looked up the money; but if so be as you object to receive it for Mr W——, you know I cannot help it; if you will wait a little, I will just write a line to say so." "I will not wait another minute," replied I, "nor be the bearer of any communication to that effect. If you choose to hand the money to me, I will take it; if not, I desire you will return my friend's note, which I consider an order for its payment." Having once more examined the order, he pulled out a drawer from beneath his plain, unpolished pine desk, and deliberately counted out the one thousand dollars, handed them to me, and "guessed I should find them all right."

Since this little affair occurred, I have often, in my intercourse with persons of a similar class to the cautious and anxious agent above alluded to, got sadly annoyed and out of humour at their suspicious and roundabout way of doing business; and though it may not appear peculiarly amiable to make a boast of it, I have ever found that a promptness and decision, and a little extra asperity, have greatly accelerated the settling matters of business, cutting short their own ordinary plan of drawling and guessing, and calculating, and scheming, to which many of them are so much addicted.

I will mention but one more instance of this peculiar degree of caution and mistrust to which I was subjected. It took place at Geneva, in the western part of the state of New York, during an excursion I made into that part of the country, for the purpose of purchasing twelve or fifteen hundred sheep. One of the city banks had, previous to my setting out, remitted me 8000 dollars, all in five-dollar bills, struck from a new plate, and none of which had previously been in circulation. In my own neighbourhood I had no opportunity of getting them exchanged for such notes as I knew would be more acceptable to the farmers in the district I proposed visiting; but knowing there were two or three banks in that vicinity, I presumed that I should experience no difficulty in getting my city bank-notes exchanged (although belonging to another state) at any of the banks in the interior of the country. Having, after two or three days' travelling, reached Geneva, I called at the banking institution of that place, made its officers acquainted with my wishes, and then exhibited my bundle of handsome new bank-notes. They evidently were a curiosity, for the whole of the parties I saw upon the premises assembled to inspect my money. They were pronounced "very elegant notes"—"no doubt they were perfectly genuine"—but not one of them remembered to have seen notes of the same pattern. After consulting some time amongst themselves, respecting what was to be done, I was at length given to understand "that it would not be convenient for them to exchange my money," which meant, I knew, that they considered my bundle of bank-notes forgeries. Without pressing the matter upon them further, I returned to the tavern where I had left my horse, but had not been there many minutes before I recognised two of my bank acquaintances in earnest conversation with the landlord; and from their side glances directed towards me, not to be misunderstood, I felt assured that I was the subject of their deliberations. I afterwards learned that the bank people had, as I suspected, considered my bundle of notes forged ones, and that they had applied to the landlord of the tavern, who was a magistrate (a very common case with tavern-keepers in the interior of the country in America), to consult with him what was best to be done in the case. The landlord had recommended the postponement of any harsh steps until the following morning, and perhaps he felt a little interested in so doing, as I had made known to him, on my arrival, that it was my intention to remain all night; whereupon my horse had been unsaddled, and my valise safely deposited in the bar—in his possession; so that he "guessed *he* was all right." During the evening, I strolled into one of the principal stores; and mentioning to the store-keeper my having in my possession some amount of city bank-notes, which I wished to exchange for western notes, he unhesitatingly informed me that it would be a great accommodation to him to make such an exchange, as he was about to set out for the Atlantic cities in a day or two, where he presumed he should have to allow a discount on his country notes of two or three per cent. The exchange was immediately effected between us; the news was soon circulated that the stranger's bills were not spurious; the bankers and the landlord put the best face on "the mistake" they were able; and I left that delightfully situated little town of Geneva on the following morning, to pursue my journey and transact my business, instead of being committed to durance vile as an impostor and a vender of forged bank-notes.

[To the above anecdotes we would append the remark, that the excessive cautiousness, or rather distrustfulness, of the Americans, must necessarily be a consequence of the unusual prevalence in that country of a desire to deceive and cheat; for men, in ordinary circumstances, are not disposed to be very cautious, and the state of mind itself is one productive of pain and inconvenience to all parties. The utility of *confidence* in business transactions and every kind of intercourse has already been illustrated in the Journal (No. 121): the prevalence of a contrary feeling tends to obstruct and even extinguish business, to an extent which few are aware of. This is, indeed, one of the cases in which moral conditions tell directly and powerfully on the substantial affairs of life, and serve to show how the adoption of all approvable means of bettering those conditions is as much the duty of a government as the immediate protection of life and property. The distrustfulness of the Americans must be nearly as fatal to commercial relations between man and man, as prohibitory duties are to the same relations between state and state.]

A FEW WEEKS ON THE CONTINENT.

ZURICH TO LUCERNE.

I LEFT the reader at Zurich, the industry of whose inhabitants led me into a few particulars respecting the commercial policy of Switzerland. The more we saw of this place and its neighbourhood, the more evident did it appear that the general comfort which marks the condition of the working-classes is as much ascribable to a peculiar economy in their domestic arrangements, as it is to the external circumstances by which they are affected. Most travellers speak of Zurich, and the canton of which it is the capital, as rather sour in social character, which they trace to the harsh forms of religious belief planted at the Reformation, and scrupulously maintained by the penalties of the law. We saw nothing of this nature, the ideas of the people on matters of religion being now considerably moderated. A gentleman belonging to the town confirmed a report I had heard, to the effect that dancing was not permitted without the license of a magistrate, but he continued to say that such a regulation is practically of small importance; for merry-making parties can easily go across the boundary of the canton into Argau, and there they may dance to their heart's content.

The canton of Zurich, like that of Basle, underwent a revolution in 1830, when its constitution was considerably popularised. Since that period, the privileges of the town and country have been nearly equal, the proceedings of the legislature and courts of justice open to inspection, financial accounts are published, the press has been made quite free, and education is promoted on a liberal scale. A not less important improvement has been the destruction of the town walls, by which means the inhabitants can no longer intrench themselves behind ramparts, and oppress at pleasure the rural districts. The bombardment which the town endured at the conclusion of the last and beginning of the present century, when the country around was the theatre of war to the French and Austrians, not to speak of the great expense incurred annually for keeping up the fortifications, affords also an unanswerable argument why these walls should have been swept away. Since this highly creditable improvement was effected, the town, as I formerly mentioned, has assumed an open cheerful aspect, and is pushing out into the country in all directions. One of the most elegant of the new public edifices is the Post-office, an extensive suite of buildings in the Grecian style, surrounding a central court-yard devoted to the business of the cantonal diligences. In Switzerland, the government of each canton has a monopoly of the diligences as well as of the posts; but the conveyances provided for passengers are handsome and substantial, and the fares are very moderate. As in France and elsewhere on the continent, neither the driver nor conducteur ask or take fees. The price of conveying letters is also on a very moderate scale. On applying several times at the Post-office for letters from England, I could not help feeling a little surprise at the confidence which was reposed in me by the keeper of the bureau. He always handed me out the whole of the letters in his possession, to seek for and take whichever belonged to me, and I had an opportunity of looking them over at my leisure on the window-sill. This unsuspiciousness says much for the general honesty of the people.

The town library, consisting of 50,000 volumes, and the arsenal of the canton, are among the few objects of general interest shown to strangers. The arsenal is chiefly remarkable for the many specimens of ancient armour and warlike instruments, which it preserves as relics of former struggles for political independence. It is amusing to find a late English tourist, who has favoured the world with his "Recollections," sneering at the modest character of this depôt of arms—"the arsenal, to one who has seen the Tower, [is] contemptible." This reminds one of the pride which some people take in showing what a fine large prison their town has got—what an immense number of felons they try at every jail delivery—what a splendid regiment of dragoons is always at hand, in case of need, in a neighbouring barrack—and that they have such an excellent executioner, that he is regularly borrowed by all the principal cities in the kingdom. Zurich has a small prison, and seldom any prisoners; it has no barracks or dragoons, and cannot

find work for an executioner. What an unhappy condition!

Suffering from such deprivations, it is agreeable to know that Zurich has long held a distinguished place in the learning, literature, and arts of Switzerland. It has been the place of birth or residence of Solomon Gessner the poet, Jean Gessner the naturalist, Hottinguer the orientalist, the learned Professor Bodmer, and his friend Breitinguer, Lavater the physiognomist, Hagenbuch, Klopstock, Wieland, and other men eminent in the German world of letters. Lavater was pastor of one of the churches of the town, and a person of amiable manners. Murray mentions his sad fate on the occasion of the town being captured by the French, September 26, 1799. "He was shot within a few steps of his own door by a brutal French soldier, to whom, but two minutes before, he had given wine and offered money, and while he was in the act of assisting another soldier who had been wounded. A high reward was offered by Massena, the French commander, for the discovery of the murderer; but though known to Lavater and his family, he refrained from informing against him. After lingering through three months of excruciating agony, he expired, January 2, 1800, at the parsonage: his grave is marked by a simple stone in the churchyard of St Anne."

The establishments for instruction at Zurich, remodelled generally since 1832, present that rational gradation from infant and elementary schools to the university, which is peculiar to German education. The institution most worthy of remark is the cantonal school, divided into two sections, and each of these subdivided into two branches—an inferior and superior. One of the two sections is called the gymnasium or college, and has for its object the preparation of young men for the university who wish to study science, theology, jurisprudence, or medicine. The other section is named the school of industry, and is designed to instruct those who are to devote themselves to commerce and general pursuits, including manufacturing industry. The inferior branches of each are, of course, devoted to the preparation of lads for the higher; and the routine of instruction would shame some of our best academies. As, for instance, in the inferior school of industry (*L'Ecole d'Industrie Inférieure*), boys are instructed in general religious truth, the elements of physical sciences, mathematics, natural history, descriptive geometry, drawing, the German and French languages, history, geography, arithmetic, writing, and singing. Latin and Greek are added in the superior department. In the whole institution there are thirty-six teachers. Entering the series of schools at twelve years of age, the youth is handed on from one thing to another, always extending his knowledge, till (if designed for the learned professions) he is ready for the university. The number of students at this the highest educational establishment, is seldom less than 200; and as the professors are partly paid by the state, the expense of attending their classes is very moderate, and therefore suited to the general condition of the people. The half-yearly fee of each student is only twelve Swiss francs, or about thirteen shillings English. I ask any candid person, if the method of preparing lads for a university education, such as is here hinted at, is not something very superior to the plan pursued in England, where young men intended for technological professions generally enter college ignorant of almost every thing but a little Latin and Greek. A glance at the gymnasium in the cantonal school of Zurich, would open up a new world of thought to the directors of most of our academies.

In connexion with the cantonal school there is a library, containing nearly 20,000 volumes, for the use of the scholars. Other establishments in the town, connected with science or literature, also deserve a passing notice, if only to show that in this simple democracy the taste for refined recreation has not been left uncultivated. There is a society of naturalists, established by Jean Gessner in 1745, possessing a museum and valuable library; a society of antiquaries; a society for the cultivation of music; and a society of artists and amateurs. This latter association, which has been founded since 1787, has a regulation by which each member at enrolment shall furnish an album with a design, pay a fixed sum, or present a gift of an object of art. The album now consists of several volumes, and is reckoned a valuable record of the taste of Swiss artists during the last half century. The society also possesses various detached works of art, including a volume of designs in crayons by Füssli. There is likewise in the town a small theatre, well supported, and which the German stars, Esslair and Seydelmann, we are told, do not disdain to honour by their visits. The university of Zurich is enriched with a zoological and also mineralogical museum; and a few years ago a botanical garden was opened. An establishment more popular and generally useful is the reading-room of a society of upwards of 400 members. This institution will compete with any thing of the kind in England. Here are taken in 41 Swiss newspapers, in different languages; 12 German, 8 Parisian, and 2 English papers; 26 literary journals, 14 theology, 19 jurisprudence, 28 medicine, 14 natural sciences, 9 mathematics, military art, and architecture, 8 philology, archaiology, and pedagogie (art of teaching); 10 history and geography, 19 political economy, commerce, and industry, and 30 upon *belles lettres* (15 of which are German, 11 French, and 4 Italian). Besides these novelties, the establishment is provided with a large array of maps, charts, dictionaries, cyclopedias, and 1000 volumes of general literature. The entry-money payable on admission to this noble establishment is only four francs, and the annual contribution is only sixteen francs (a Swiss franc is worth about 1s. 1½d. English). It may surprise the English reader to learn that so extensive a collection of journals should exist in a Swiss town possessing little more than 14,000 inhabitants, and the fact is in various respects not without its value; but the circumstance most worthy of notice is the diversity of character of the works. In most public reading-rooms in our own country, there are rarely more than two or three journals which are non-political.

To all appearance, the Zurichois are engaged in pursuits somewhat more solid and profitable than political or ecclesiastical wrangling. The working-classes and traders, who constitute the bulk of the people generally, contrive to save from their earnings; and it may be said that all, from high to low, here as elsewhere in Switzerland, are anxious to accumulate the fruits of their enterprise and industry. There being no outlet for ambition in rank, titles, or any other circumstance independent of personal qualification, the leading objects of desire are to make money, buy a piece of ground, and build a house. This fancy, which I presume to be perfectly legitimate, has decorated the environs of Zurich with villas, and scattered over Switzerland cottages of all shapes and sizes. If the reader accompany me on an excursion up the lake of Zurich, we may see a variety of these snug seats of rustication of a wealthy, or at least comfortable, set of citizens.

It was, as usual, a very beautiful morning, when, stepping from the quay, I found myself on board the Escher-Linth, a neat steam-boat, which plies daily from Zurich to Schmerikon, at the farther extremity; and the fares on board of which, by dint of competition with another steamer, are tolerably moderate. The excursion, to those who wish to return, occupies an entire day, but includes a stoppage of two hours for dinner. On the present occasion, the vessel shot off from the quay with a goodly number of passengers, of different nations, some being tourists bound for the Grisons, by way of Coire, and others designing only to see the borders of the lake, or to visit the adjacent districts; the greater number, however, were Germans, the men distinguishable by their cloth caps, large watch-keys, and incessant smoking, and the women by their plain appearance and diligent knitting of stockings. Dull as I was in consequence of having been obliged to undertake this side-journey by myself, the views, as the boat passed along the clear green waters, were so pleasing that it was impossible to be out of humour with the scene. Leaving the white and irregular buildings of Zurich at the northern extremity of the lake, with a back-ground of villa-clad heights, we find ourselves on a stretch of water of from three to four miles in breadth, and open at least twelve miles in front, but extending altogether to nearly twenty-six miles. The lake possesses no islands within sight, a deficiency which forms a marked distinction between this as well as other Swiss lakes and the lochs of Cumberland and Scotland. Great beauty in the banks compensates in some manner for the want of green and bushy islets. On each side, gently sloping hills rise from the shore, and are every where laid out in vineyards, corn lands, or pastures, plenteously decorated with trees and enclosures, with a thick scattering of detached cottages and gentlemen's seats, also neat villages, each with its antique church spire, planted along the shores. Darting from point to point, the steamer makes a call at these villages, setting one or two persons down here, and taking others up there, and affording us a glimpse of the place as we pause for a few minutes in front. Some of the villages are evidently hives of industry. At one we see a factory, with its wheel tumbling round under the impulse of a brook dashing hurriedly down a ravine from the hills; at another, there appears to be a great deal done in dyeing, and workmen are out in barges on the lake, washing the coloured yarns from their impurities—in short, much work of one sort or other is going forward, all in a primitive kind of way.

The hills which thus form the ornamental foreground of the picture, are backed by others of much greater altitude, and of a wild appearance. On the right, in passing from Zurich, we observe the Albis, the highest mountain range in this quarter; and, as a grand backing to the southern end of the lake, we see the lofty and sublime peaks of the Alps of Glarus and Uri, basking in the glare of the summer's sun, but covered with mantles of the purest snow. About noon the vessel touches at Rapperschwyl, on the left bank, a town of improving aspect; and here we find a wooden bridge of great length, crossing from one side of the lake to the other, and a part of which is raised to allow us to pass. From various appearances, the lake is here seemingly closing up, and by and by a meadow of alluvial soil, thickened with aquatic plants, will cut the lake in two. Near the right shore is a low grassy islet, clothed with some wood, which will in all probability be soon joined to the mainland from the same cause. After passing the bridge, we enter an upper division of the lake, which bends towards the east; the hill-sides become more pastoral, and are more thinly inhabited as we advance; and finally we are brought to the limits of the lake navigation at Schmerikon, a village consisting of an inn, a church, and a scattered collection of houses. Although the steamer halts here, there is a water communication farther up the valley by the Linth canal, which reaches the lake of Wallenstädt at several miles' distance.

Having landed at this place, I proceeded on an excursion up the vale, which is rather beautiful, with heights on each side, and cottages of a more rural class of peasantry than I had previously seen. The district belongs to the canton of St Gall, and may at once be recognised as Roman Catholic by the figures and the gilt crosses in a burying-ground occupying the top of a sunny knoll. Climbing the ascending braes, I had here an opportunity of seeing the *menage* of Swiss rustic life, of a class hovering between that of the alpine regions and the suburban condition. From the higher ground a good view is obtained of the vale beneath, and of the means which have been adopted to render it salubrious. Previous to 1822, it was subject to constant overflowings of the Linth, in consequence of the waters being dammed up at a part of their course by debris brought down from the glaciers; but according to the plans of Mr Conrad Escher—a new course being given to the Linth, by which the rubbish it brought down could be deposited in safety—inundations were in future obviated, and the valley stretching between the lakes of Zurich and Wallenstädt has been thus rendered healthy and suitable for pasturage. It is also now the seat of manufacturing industry, a large factory being planted near the Linth canal—a situation, certainly, in which I was not a little surprised to find such an establishment. The lake of Wallenstädt is much smaller than that of Zurich; but though traversed also by a small steamer, I did not think of stopping to inspect it, as its scenery is of comparatively little interest, and there was nothing else of moment to attract attention. As already mentioned, the route in this direction leads towards the Grisons, a secluded portion of Switzerland, with peculiar manners and language; and for the accommodation of travellers, a diligence runs to and from Schmerikon in connexion with the Zurich steamer.

My return to Zurich requires no particular notice; and having finished all necessary observations there, I proceeded with my companions in the direction of Zug and Lucerne, which is by a south-western route over the Albis. Passing various hamlets of neat cottages, and crossing the vale of the Sihl, we are conducted by a zig-zag cut road to the summit of this mountain tract, a height of nearly 3000 feet, from which a new world of picturesque beauty opens upon the eye. Attaining the brow of the mountain, and emerging from some clumps of wood, we are presented with the magnificent prospect of the Bernese Alps, lying like a great chain of snowy peaks on the distant horizon, and among which the Jungfrau rises conspicuous with its eternal glaciers. A more lovely scene is observable in the lower ground immediately before us—the lake of Zug, glistening like a clear mirror among rugged woody hills, and bounded on our right, or towards the north, by the fertile plain through which rolls the river Reuss.

In descending the mountain and entering the canton of Zug, the roads become very bad; and from numerous emblems, we find we are again in a Roman Catholic territory. The town of Zug, a little old-fashioned place, which we reach at the bottom of the hill, has a melancholy and dull aspect, but is improving. We found the walls and gateways in the act of being removed; and the road by a new cut pushes boldly into the town, instead of creeping through a narrow and inconvenient portal. Go on, Zug! I give you credit for this instance of common sense. We spent but a short time in our perambulation of the town and its environs, inhabited, as we thought, by a decent and industrious set of people; and in the latter part of the day, after passing through a rich and beautiful tract of country, reached Lucerne, at which we proposed to remain for a few days to enjoy the exquisite scenery on its lake.

ORIGINAL STORY OF KING LEAR.

The world has long been aware that Shakspeare, transcendent as were his powers both of invention and execution, contented himself, in the case of nearly the whole of his plays, with adopting the plots presented to him by the historians, romancers, and dramatists of preceding days. More particularly did he adhere to truth in his historical compositions, the very words of the old chroniclers being frequently used by him, with only such alterations as were necessary to cast them into blank verse. This fact, properly viewed, ought only to add to our estimation of the poet, indicating his consciousness that art could never excel nature, nor the human fancy conceive imaginary events and language more fit to "purge the soul by pity and by terror," or more provocative of laughter, than the realities disclosed in the authentic annals of our kind.

Geoffrey of Monmouth, it is usually supposed, told for the first time the story of *King Llyr* and his daughters, on which Shakspeare based the inimitable tragedy of Lear. It is related, however, in a Welsh manuscript history of earlier date, entitled the "Chronicle of the Kings," and written by a bishop of Wales named Tysilio. This work was composed at the close of the seventh century, and several copies of it are in existence. It thus tells the story of Llyr, or Lear, the eleventh king, according to the account, of Bri-

tain—a term then confined in a great measure to Wales.

"After Bleiddud came Llyr, his son, to be king, and he governed in peace and tranquillity for five-and-twenty years; and he built a city upon the river Soram, which he called Caer Llyr, and in another language, Leir Cestyr.* And he had no son, but three daughters, whose names were Goronilla, Regan, and Cordeilla;† and their father had excessive fondness for them, yet he loved the youngest daughter more than the other two. Thereupon he considered how he might leave his dominions amongst his daughters after him. Wherefore he designed to prove which of his daughters loved him the most in particular, so that he might bestow upon that one the best part of the island. And he called to him Goronilla, his eldest daughter, and asked her how much she loved her father. Whereupon, she swore to heaven, and to the earth, that she loved her father dearer than she loved her own soul; and he believed then that this was true, and bequeathed to her the third part of the island, and the man she should most prefer in the isle of Britain to be her husband. After that he called to him Regan, his second daughter, and asked her how much she loved her father; and she, too, swore by the powers of heaven and earth, that she could not, by her tongue, declare how much she loved her father. He then believed this to be the truth, and left to her the third part of the isle of Britain, together with the man she should choose in the island for her husband. And then he called to him Cordeilla, his youngest daughter, and whom he loved the most of all, and he asked her how much she loved her father—to which she answered, 'I do not think there is a daughter who loves a father more than she ought; and I have loved thee through life as a father, and will love thee still. And, sir, if thou must know how much thou art loved, it is according to the extent of thy power, and thy prosperity, and thy courage.' And thereat he was moved with anger, and said, 'Since it is thus that thou hast despised my old age, so as not to love me equally with thy sisters, I will adjudge thee to have no share of the isle of Britain.' Thereupon, without delay, he gave to his two eldest daughters the two princes, namely, the Prince of Cornwall and that of Scotland,‡ and half the kingdom with them, whilst the king lived; and after his death, the island in two parts between them. And when the rumour of this was spread over the face of the countries, Aganippus, King of France, heard of the wisdom of Cordeilla, and of her form and beauty; he therefore sent ambassadors to the isle of Britain, to demand of the king Cordeilla, his daughter, to be his wife. And he promised her, and declared to the ambassadors, that he should not have any territory or other wealth with her from the isle of Britain. And Aganippus said that he was not in want of his territory or his riches, but of his noble and illustrious daughter, to beget of her honourable heirs; but there was no delay before Aganippus took the maid in marriage, and no one in that age beheld a maid so fair and so wise as she.

After a length of time had elapsed, and Llyr was beginning to be feeble from age, his sons-in-law came with his two daughters, and subdued the island from one sea to the other, and they divided the island and the government between them two. This was after the deluge, 1460 years. Thereupon Maglon, Prince of Scotland, took the king to him, with forty knights in his train, to be maintained at his own charge. But two years were scarcely concluded, before Goronilla grew displeased on account of her father's retinue; and she came to him, and desired that he would dismiss the whole of such retinue except twenty knights, observing, that that number was sufficient for a person who was not concerned in wars or any weighty affairs. Thereupon Llyr became enraged with his daughter for slighting him to such a degree, and he quitted the court of Maglon, and repaired to that of Henwyn, Prince of Cornwall, expecting to have his dignity and rank better supported there than in the court of Maglon. And Henwyn received him joyfully, and treated him honourably, as he ought. But a year and a month had not quite elapsed before Regan, his daughter, grew angry with him on account of the greatness of his train, and desired him to send away the whole thereof, except five knights, and declared that she would maintain only so many in his retinue, and which she deemed sufficient. After he had been obliged to dismiss his knights, he became grieved for the loss of his former dignity, and he returned a second time to his eldest daughter, expecting that she would have compassion on him, and would preserve him his dignity. But she declared that she would maintain only one knight with him, and that was enough for her to do, as the knights of her lord were at his command. Finding he could obtain nothing by his entreaties, he sent away all his knights excepting one, who continued with him. Then, after meditating upon his former rank, which he had lost, he became oppressed with cares, and sorrowful almost unto death. The words of his daughters and their professions came upon his mind, and thereupon he knew that what was said to him by Cordeilla his daughter was true; and according to his prosperity, his power, and his courage, would he be beloved.

On this he bethought himself that he would visit Cordeilla his daughter, to implore her mercy, and to see if he could obtain any kind of assistance from her towards recovering his dominion. And after he had gone off to sea with three attendants, bewailing his affliction and wretchedness, he exclaimed, with weeping and groaning, after this manner:—'O, heavens! why did ye exalt me to the summit of honour, since it is more painful to remember honour after it is lost, than to suffer want without the experience of prosperity! Gods of heaven and earth! let the time yet arrive when I may be able to retaliate upon the persons who have reduced me to this distress. Ah! Cordeilla! my beloved daughter, how truly didst thou say to me—as my power, and my possessions, and my wealth might be, so should I be respected; and for what thou didst speak I became offended with thee. O! my beloved daughter! in what way shall I be able, for shame, to approach thee now, after having suffered thee to go away from the isle of Britain so destitute as I have done?' Continuing to lament his pain and wretchedness in this manner, he came near to Paris, the city wherein his daughter was, and he sent a messenger to her to announce that he was coming, a poor, weak, afflicted man, to implore her mercy to see her. When she heard this she wept, and inquired how many knights there were with him. The messenger declared there was but one squire; she then wept more bitterly than before, and sent him gold and silver, desiring that he should go privately as far as Amiad,* or to some other city that he might think proper—to take perfumes, and baths, and precious ornaments, and to change his condition, his ornaments and garments, and to take with him forty knights, in the same dress as himself. And when they should be completed and ready, he was to send a messenger to Aganippus, King of France, to announce to him his coming, after having been disgracefully expelled by his two sons-in-law from the isle of Britain, and to implore his aid to regain possession of his dominions.

All that did Llyr do, as Cordeilla his daughter had desired him. And when the messenger came to announce to the king that Llyr was coming to have an interview with him, he was rejoiced; and he came to meet him with a fair and splendid retinue to a great distance from the city, proceeding till Llyr met him; and thereupon they alighted, and embraced affectionately, and proceeded to Paris. And there they dwelt together for a long time, happily and joyfully. When the disgrace of Llyr in the isle of Britain was told to Aganippus, he was greatly affected; and thereupon it was agreed in council to assemble the armies of France, and to subdue the island again. And then Aganippus gave the government of France to Llyr, whilst he should be assembling the remote parts. When their forces and necessaries were ready, it was agreed in council to send Cordeilla with Llyr, lest the French should not be obedient to Llyr. And Aganippus commended the French, as they valued their souls, and at their peril, to be as obedient to Llyr and to his daughter as they would be to himself.

When they had taken leave, they set off towards the isle of Britain; and against them came Maglon, Prince of Scotland, and Henwyn, Prince of Cornwall, with all their power, and fought gallantly and severely with them; but, owing to the French being so numerous, it did not avail them, for they were put to flight and pursued, and a multitude of them slain; and Llyr and his daughter subdued the island before the end of the year from one sea to another, and chased his two sons-in-law away out of the island.

And after the isle of Britain had been conquered by Llyr, a messenger came from France to inform Cordeilla of the death of Aganippus; and she took that very heavily to heart, and from thenceforth she preferred dwelling in the isle of Britain with her father, than return to France on her dowry. Whereupon, after they had reduced the island to them, they governed it for a long time in peace and quietness until Llyr died. And after his death, he was honourably buried in a temple which he had himself built in Caer Llyr, under the river Soram, to the honour of some god who was called *Janus Bifrons*. And upon the festival of that temple, all the craftsmen of the city used to come to honour it, and then they would begin every work that was to be taken in hand to the conclusion of the year.

After the decease of Llyr, Cordeilla took the government of the isle of Britain, and she managed it for five years in peace and tranquillity, and in the sixth year rose her two nephews, sons of her sisters, who were young men of great fame, namely, Margan, the son of Maglon, Prince of Scotland, and Cunedda, the son of Henwyn, Prince of Cornwall. And they assembled an army, and made war on Cordeilla; and after frequent conflicts between them, they subdued the island, and took her and confined her in prison. And when she thought of her former grandeur which she had lost, and there remained no hopes that she should be again restored, out of excessive anguish she killed herself, which was done by stabbing herself with a knife under her breast, so that she lost her soul. And thereupon it was adjudged that it was the foulest death of any for a person to kill himself. This happened a thousand and five hundred years after the deluge."

* Most probably Leicester, which Nennius, in his "Historia Brittonum," calls Caer Lleirou, a name not unlike the one here used.

† Shakspeare has softened these names into Goneril, Regan, and Cordelia.

‡ The Welsh name for Scotland, used in the original, is Alban, whence came the Albany of Shakspeare. The name of the prince, however, as appears from the sequel, was Maglon, and the Prince of Cornwall was named Henwyn.

* It seems doubtful what town is here meant, unless it be Amiens.

JOHNSON'S PURSUIT OF HEALTH.

Dr James Johnson's work, entitled "Change of Air, or the Pursuit of Health and Recreation through France, Switzerland, Italy," &c., has gone through various editions, and deserves such a tribute to its utility. This gentleman combines, in no ordinary degree, the capabilities for professional observation with the tact and liveliness of the accomplished general tourist. He is remarkable, moreover, for giving his own opinions freely and unhesitatingly, without exhibiting any of that slavish deference for established axioms, which renders the works of so many modern travellers little better than imitations of those of their predecessors.

Sentimental people are accustomed to rave about the skies of Italy, and to assume that they produce an earthly paradise. Dr Johnson tells another tale of one of the finest portions of that peninsula:—"A phenomenon," says he, "resulting from the physical operation of climate on the human race, and which is equally curious and melancholy to contemplate, may be seen on a large scale in the great hospital of Milan—the *pellagra* of the Lombardo-Venetian plains. Those who have not courage to view it in the living body, may form a tolerable idea of its external characters from some excellent representations in wax, at the museum of the University of Bologna.

This horrible malady, or complication of maladies, has only been observed during the last sixty or eighty years, and is rapidly increasing. The proportion of cases in the hospital is very considerable. It begins by an erysipelatous eruption on the skin, which breaks out in the spring, continues till the autumn, and disappears in the winter—chiefly affecting those parts of the surface which are habitually exposed to the sun or the air. This cutaneous symbol of an internal disorder is accompanied or preceded by remarkable debility, lassitude, melancholy, moroseness, hypochondriacism, and often by a strong propensity to suicide. Year rolls on after year, and the cutaneous eruption, as well as the general disorders, become more and more aggravated, with shorter and shorter intervals in the winter. At length the surface ceases to clear itself, and becomes permanently enveloped in a thick, livid, leprous crust, somewhat resembling the dried and black skin of a fish! By this time the vital powers are reduced to a very low ebb, and the intellectual functions are often affected. The miserable victim of the dreadful pellagra loses the use of his limbs, more particularly of the lower extremities—is tormented by violent cholic, headache, nausea, flatulence, and heartburn—the appetite being sometimes null, at others voracious. The countenance becomes sombre and melancholy, or totally void of expression, the breath fetid, the teeth rotten, the inside of the mouth ulcerated, the mucous membrane highly irritable, and diarrhœa is a common accompaniment of the other disastrous train of miseries. But the most distressing phenomenon of all, is a sense of burning heat in the head and along the spine, whence it radiates to various other parts of the body, but more especially to the palms of the hands and soles of the feet—tormenting the wretched victim day and night, and depriving him completely of sleep! He frequently feels as if an electric spark darted from the brain, and flew to the eyeballs, the ears, and the nostrils, burning and consuming those parts. To these severe afflictions of the body are often added strange hallucinations of the mind. The victim of pellagra fancies that he hears the incessant noise of millstones grinding near him—of hammers resounding on anvils—of bells ringing, or the discordant cries of various animals! The disease, when advanced, takes the form of many other maladies, as tetanus, convulsions, epilepsy, dropsy, mania, and marasmus—the patient ceasing at last to exist and to suffer, when reduced to the state and appearance of a mummy. It is by no means uncommon—who can say it is wonderful?—that the wretched being abbreviates the term of his afflictions, and anticipates the too tardy hand of death in a paroxysm of suicidal mania! It is remarkable that this tendency to self-destruction very often assumes the form of a desire to consummate that last act of the tragedy by drowning—so much so, that Strambi, a writer on the pellagra, has given it the name of *hydromania*, when this propensity exists.

Whatever may be the precise nature of the cause of this dreadful disease, it is certain that it is almost universally confined to those who reside in the country, leading an agricultural life, and to the lowest orders of society. It is not bounded by any age, being frequently seen in the youngest children. The whole of the flat country on both sides of the river Po, but more especially the fertile and level plains between that river and the Alps, are the theatre and headquarters of pellagra. I have only sketched the more prominent features of the complaint, and I have by no means magnified either its horrors or its prevalency. If those who doubt this statement will consult

the native writers on the malady, as Strambi, Trapolli, Soler, Zanetti, and many others, they will acknowledge that I have softened rather than exaggerated the picture.

Such is the sweeping and terrible scourge of those beautiful and fertile plains that furnish themes of admiration for the poet, the painter, the novelist, and the romantic tourist! Had Rogers and Wordsworth, while celebrating the borders of Como and the Lago Maggiore, representing them as terrestrial paradises, been acquainted with the pestilence that afflicts one-seventh of the inhabitants, they would have curbed a little their poetic fancies, or added a background to the picture:

——— 'Where the world danced,
Listening to Monti, quaffing gramolata,
And reading in the eyes that sparkled round,
A thousand love-adventures written there.'—ROGERS.

The ordinary traveller is so enchanted with the fertility of the soil, the beauty of the lakes, the romantic grandeur of the surrounding Alps, and the brilliancy of the skies, that he overlooks the misery of the inhabitants, and the diseases that carry them to a premature grave. The poet avoids such scenes:

'I turn'd my prow and follow'd, landing soon
Where steps of purest marble met the wave;
Where through the trellises and corridors
Soft music came, as from Armida's palace,
Breathing enchantment o'er the woods and waters.'
—ROGERS' *Italy*."

Another extract may be given, exhibiting the writer of these observations in his medical character. He thus speaks of what he calls *etiolation*, or the unhealthy blanching visible too often on the cheek of the denizen of cities. "The inhabitants of a city may easily be distinguished from those of the country by the pallor of their complexions. The care-worn countenance is generally 'sicklied o'er with the pale cast of thought,' but the etiolation, or blanching, which I am now to notice, takes place independently of much thinking or mental anxiety. It cannot, in fact, boast of such an intellectual origin as the other. It is the result of physical rather than of moral causes —more especially of bad air, inexposure to the light of heaven, sedentary avocations, inactivity, late hours, &c. I have used the word *etiolation*, because I think it perfectly appropriate. When a gardener wishes to etiolate, that is, to blanch, soften, and render juicy a vegetable, as lettuce, celery, &c., he binds the leaves together so that the light may have as little access as possible to their surfaces. In like manner, if we wish to etiolate men and women, we have only to congregate them in cities, where they are pretty securely kept out of the sun, and where they become as white, tender, and watery, as the finest celery. For the more exquisite specimens of this human etiolation, we must survey the inhabitants of mines, dungeons, and other subterranean abodes; and for complete contrasts to these, we have only to examine the complexions of stage-coachmen, shepherds, and the sailor 'on the high and giddy mast.' Modern Babylon furnishes us with all the intermediate shades of etiolation, from the 'green and yellow melancholy' of the bazaar maiden—who occupies somewhat less space in her daily avocations and exercise than she will ultimately do in her quiet and everlasting abode—to the languishing, listless, lifeless *albinos* of the boudoir, etiolated in hothouses, by the aid of 'motley routs and midnight madrigals,' from which the light as well as the air of heaven is carefully excluded! Thus penury and wealth, obscurity and splendour, industry and idleness, the indulgence of pleasure and the endurance of pain, all meet at the same point, and, by the mysterious workings of an overruling Providence, come to the same level, in this respect, at last. That voluntary dissipation should suffer all the evils attendant on necessary and unavoidable avocation, no one can regret; but that useful toil and meritorious exertion should participate, and more than participate, in the miseries which follow in the train of the 'gay licentious proud,' is a melancholy reflection. The longer we live in this world, however, and the more narrowly we watch the ways and the fate of man, the more we shall be convinced that vice does not triumph here below—that pleasure is invariably pursued by pain—that riches and penury incur nearly the same degree and kind of taxation—and that the human frame is as much enfeebled by idleness as it is exhausted by labour.

But to return to etiolation. What does this blanching indicate? In the upper classes of society, it indicates what the long nails on the fingers of a Chinese indicate—*no avocation*. In the middle and lower orders of life, it indicates *unhealthy avocation*; and among the thinking part of the community, it is one of the symbols or symptoms of wear and tear of constitution. But different people entertain different ideas respecting etiolation. The fond and fashionable mother would as soon see green celery on her table as brown health on the cheek of her daughter. When, therefore, the ladies venture into the open carriage, they carefully provide themselves with parasols, to aid the dense clouds of an English atmosphere in preventing the slightest intrusion of the cheerful but embrowning rays of Phœbus. In short, no mad dog can have a greater dread of water, than has a modern fine lady of the solar beams. So much does this Phœbophobia haunt her imagination, that the parasol is up even when the skies are completely overcast, in order that the passing zephyr may not woo her delicate features and complexion."

As a medical observer, Dr Johnson will require no panegyric, we imagine, after the perusal of the common sense views developed in these extracts. Of the liveliness of his general descriptions, we shall present but one specimen, and conclude by recommending the work most peculiarly to public notice, of which it merits even a larger share than it has obtained. Speaking of the statues in the museum of the Capitol at Rome, he thus describes the feelings excited by the quietude of that stony assemblage of great ones, some of them once bitter foes to each other:—"Behold the venerable, the highly-gifted patriot and philosopher—Cicero. He stands unmoved in the presence of the murderous triumvirs. He breathes no vengeance against Antony, who proscribed him—he casts no reproach upon Augustus, who sacrificed him. He is silent when he might denounce with safety. But he has probably seen more than the page of history has revealed; though that may convince us that the anguish of soul which terminated in his proscriber's suicide on the sands of Egypt, was fully an equivalent to the bodily fear which preceded his own assassination among the rocks of Gæta. If he upbraid not his friend Augustus for surrendering him up a victim to the hatred of Antony, it is perhaps because he is conscious that, on the great political stage where he chose to act his part, *friendship* is only a character assumed, like other theatrical characters, during the time it is wanted. Or does the presence of Terentia, that faithful wife who fought his battles during his timorous exile—to whom he indited his unmanly epistles from Dyrrachium—and whom he afterwards repudiated, without cause, in the hour of prosperity, and at the age of sixty-one, for a flirting girl—does her presence, I say, prevent him from hurling the charge of ingratitude at the head of Augustus?

Near to Tully stands his quondam friend and firm supporter, the stern, the inflexible, the stoic Cato. He is no longer 'pent up in Utica' by the sword of Cæsar, but now confronts him on the summit of the Capitol. This rigid censor, who stumbled over straws and leaped over temples—who arraigned a Roman consul for the crime of dancing, while he himself turned brigand to plunder a rich but defenceless miser of all his pelf—who deposed an unoffending prince, because he was weak, and robbed him because he was wealthy—who was so stupid as to boast of this transaction, which all the sophistry of his friend Cicero failed to palliate—who, in fine, viewed other men's failings through a powerful lens, and the springs of his own actions through an opaque medium. Such is the Roman patriot whom Addison wishes us to admire, but whom philosophy teaches us to distrust. And 'mark the end:' Ptolemy, the miser, could not survive the loss of his gold, and therefore destroyed himself—Cato, the stoic, could not bear the ascendancy of Cæsar, and therefore stabbed himself! There is sometimes—perhaps oftener than is imagined—retributive justice even on this side of the grave."

FINDON AND ITS HADDOCKS.

THERE are perhaps few persons either in Scotland or England who have not seen or heard of "Finnon Haddies." Notwithstanding this notoriety, which it owes entirely to its haddocks, Findon itself, in regard to its locality, magnitude, and the social condition of its inhabitants, remains in all the obscurity of similar communities. Indeed, so small is the curiosity to inquire after the place and condition of those persons through whom we enjoy one of the greatest dainties of home produce, that I have met with connoisseurs who could scarcely tell me the coast on which Findon was situated. Induced by the fame of its haddocks to pay this little village a visit during the month of August last, I gleaned a few facts, which I conceive may be worthy of publicity.

The village lies about six miles south-west of Aberdeen, on the brow of a hill, sloping eastward to the coast of the German Ocean. It contains about forty houses and 220 souls. Like most fishing villages, Findon is irregularly built; but the exterior of the houses, and the open spaces before the doors, are generally much cleaner than in similar places. In the interior of the cottages, I was surprised to see so much cleanliness, order, and taste, on the part of the females in their domestic arrangements—the furniture thoroughly clean and tastefully placed—the crockery, which is in great quantities, all clean and nicely set off—the "ben end," the floor of which is elevated a few inches above that of the "but end," extremely clean and tidy. In this village, whether inside or outside, industry seems the order of the day. Men and women rise every morning with the lark—the former to shove out to sea, the latter to tramp to the Aberdeen market with the "haddies." Such is the health which these industrious fisherwomen enjoy, and such are the results of this health, that the great majority are able to carry on their backs a hundred-weight of fish the distance of six miles without a single rest; and, indeed, so little discomposed are they by their loads, that many of them amuse themselves by knitting stockings on the way.

The countenances of these females, although not so fine and sweetly formed as some we meet with in the streets of large and crowded cities, yet present such a picture of health and enjoyment as cannot be contemplated without pleasure. Their dress, especially when coming to the market, is neither gaudy nor costly, but for neatness and cleanliness could not be exceeded. Their body-dress, which consists of a long wrapper, a constant observer would be inclined to suppose was washed and mangled for every journey, while their head-dress, which consists of a plain close single-bordered cap, is as white as snow. It is said that, as regards dress, the greatest ambition of a Findon female is to have the last-mentioned article spotlessly pure.

The intellectual condition of the fishermen of this village seems to be extremely low. They live and die in a state of utter ignorance as to all that is beyond their own village and their own occupation. They have, especially during the winter season, much spare time, which they spend in a manner more resembling the habits of dogs than those of rational beings—a mere alternation of lounging and sleeping. Such a thing as a weekly periodical never reaches this village. I could find no one who had ever heard of the Penny Magazine or Chambers's Journal; and even a provincial newspaper is a rare thing, and only seen during the winter season, when perchance one of the previous summer reaches them in the shape of waste paper. Some time ago, through the active exertions of a few philanthropic individuals, a library was instituted in the village; but through a total indifference on the part of the fishermen, it was soon given up. So little interest had the inhabitants felt in this institution, and so small was their knowledge of the collection of books, that no one I saw could give me the least information on the subject. This distaste for reading cannot be supposed to arise from a want of education, such as it is, or has been; for I was assured that every youth, male and female, receives on an average five years of schooling. The course is composed of reading, writing, and arithmetic, and all of them go through, and generally commit to heart, the paraphrases, most of the Psalms, a good share of the New Testament, and the whole of the Shorter Catechism. Surely we have here a very strong proof of the insufficiency of the present system of training in country schools, and more especially those in the immediate vicinity of fishing communities. If the education of five years were what it should be, it would often be found to lay the foundation of a future taste for knowledge. I had the curiosity to examine a boy, whose course had been newly ended. He could read and count tolerably; but of the meaning of what he read, or the principle by which his accounts were evolved, he just knew as much as might be expected from a parrot or monkey, had they been trained to such mechanical performances. The powers of reasoning and reflection are entirely neglected in the education of these fisher youths, and the effects of this are painfully experienced during life.

The social manners of these fishermen have undergone, during the last half century, a considerable change to the better. Intemperance is scarcely known among them; indeed, it seems to be admitted by one and all, that whisky is good for nothing, save on two particular occasions. One of these occasions is a winter morning, during a fall of snow or sleet, when the fishermen determine upon going to sea; the other is, when, after being out all night, they come home in the morning to a good day's work. On both of these occasions, they allow themselves one glass of ardent spirits. Merry-makings occur only at marriages and christenings. Those at marriages are the most extravagant, never lasting less than three days, and often a week. Dancing, singing, and playing, mark these festive meetings, from which whisky is nearly banished. Some time ago, the minister of the parish prohibited marriages from taking place on the Saturday, to save violations of the Sabbath; but this prohibition is already neglected. One practice prevails, which, for the future interests of this community, cannot be too soon discontinued: I allude to the circumstance of merchants from the town, when engaging a boat's crew of men, allowing so much money for the express purpose of drinking. I was informed that these were the only times when intoxication could be said to prevail; and I was sorry to think that men, possessed of superior advantages and knowledge, should endanger the happiness of a simple community by patronising such a practice. In regard to the various improvements in every department of human knowledge, and which form the great characteristics of the age in which we live, I have already noticed that they are entirely ignorant, save of the existence of the "stame-boat," and for this they are indebted to its passing by their village. In regard to the improvements in education, they entertain some vague and laughable ideas. I questioned them if the education given to their families was the same as they had got themselves. "Oo na—terrible chinges in edication. In oor days we were garred mak oor writing strokes like bows; noo they mak them like horse-whips: oo, ay, sad chinges, indeed!" Such is the fisherman's idea of educational reform, and the only reform too of which he has any idea. Most of them have introduced the use of the compass in their fishing-boats, and from that instrument they confess they have derived great benefit. When overtaken by a heavy fog, which, at certain seasons of the year, is a very common occurrence, and when many miles from home, and unable to see ten yards before them, by means of this simple instrument they will steer with the utmost confidence into their narrow creeks. Formerly, during thick fogs, they were exposed to all the fears and dangers

of bewildered crews. I questioned them about the barometer, but of it they knew nothing. They thought they had seen something like the thing I described about lighthouses, and they had been informed that it told the changes of the weather to a minute; yet they never had thought of inquiring after one. I explained its nature, and its great uses in saving lives. On my telling them that it would sometimes give its warnings when the oldest and most experienced seamen could detect no symptoms of approaching dangers, they looked at me with an incredulous stare. I questioned them in regard to their knowledge of geography, and whether, in the event of their being driven from their coasts to some other, they could tell that coast. Their ideas on this subject were crude and very incorrect. The superstitions common to this community are so like those of similar communities, that an account of them would afford no novelty.

I shall now proceed to a description of the manner of preparing those yellow fish, which have given to this village its fame. The fish called "Finnon haddies" are not exclusively the produce of this village, but of other four lying on the same coast between Aberdeen and Stonehaven. When the fish are prepared and brought to the table, it is said that connoisseurs can tell the particular village from whence they come. With these judges, Findon stands second in the quality of its fish. The secrets of preparing the fish lie in the mode of drying them, the time required for smoking them, and the nature of the substance by which they are smoked. Simple as the process may appear, yet I was informed that there was great scope for nicety of judgment. In the summer season, when the weather is fine, the fish, after being gutted and cleaned, are spread before the door to dry. A certain time is allowed for this, depending upon the dryness of the weather. They are then taken into the house, pierced behind one of the upper fins by an iron rod, and hung, to the number of four or five hundred, upon transverse rods, over a furnace in the corner of the house. The furnace is supplied with peat dross of a peculiar nature—much depends on this—for the purpose of smoking them. This process, when the fish are previously dried, occupies about three hours. In the winter season, the fish are dried in the house. They are hung over the furnace wet; a clear red fire is kept up for about four hours, at the end of which time the peat moss is introduced to smoke them. The same time is allowed for smoking the last as that of the first. This mode of preparing the yellow haddocks is peculiar to the five villages already mentioned. Other villages which produce yellow fish, do so by means of a kiln. Over this kiln the fish are spread, not hung; hence they do not require a hole pierced, as in the case of the Findon haddocks. Nevertheless, a hole is made for the purpose of deception; but with this unavoidable distinction, that, in the former, the hole is made subsequent to the process of browning, while in the latter it is made previously to it. The result is, that in the one case the interior of the hole is browned, and preserves the width of the rod, while in the other the interior of the hole is fresh and collapsed. This is the only distinguishing mark by sight between the real and the spurious Findon haddock.

I shall conclude this account of the Findon community by a few remarks on the nature of their leases. Whenever a new house is wanted, the landlord grants a certain quantity of land, upon which he builds the shell of the house. The tenant roofs it, and finishes it within at his own expense. In consideration of this, he holds the house at a lower rent than otherwise he would have done. It will appear strange, that after this outlay on the part of the tenant, he is liable to ejectment at the landlord's pleasure, and can claim none of his expenses. Such unequal conditions might, on the part of an unscrupulous landlord, be converted to his great advantage; yet the past experience of this very inequality presents this pleasant subject for reflection, that, while the power to distress was unlimited, scarcely a single case of such a nature has ever occurred. This fact of itself speaks volumes for the confidence and friendship which exist between these simple fishermen and their landlords. Of the cause of this peculiar provision I am ignorant, but its moral results are evident. To the youthful fisherman who aspires to the independence of a tenant, it necessitates a long and constant course of industry, with a careful husbanding of his gains. Of this youthful discipline he feels the benefits through the whole of his future life, in the shape of a reduced rent, and, what is far more important, active and frugal habits.

OVER-EDUCATING.

At no period of youth should education be pushed beyond its proper limits, or the mind be worked above its powers; the welfare of the pupil demands the observance of this rule on the part of the master as well as the parents, more especially when the child belongs to that class of strumous children whose intellects are preternaturally acute. Unfortunately, however, these are generally the pupils selected by the masters to do credit to his establishment; every means are taken to encourage this premature manifestation of the mind, and to stimulate the child to renewed exertions; and thus the health is enfeebled, and even life is often sacrificed, at a period of brilliant promise, when the hopes of friends are buoyed up by fallacious expectations, which a more rational system of education might have realised.—*Sir James Clark on Consumption.* [How many melancholy instances could be advanced of the truth of these admonitions!]

AN EMIGRANT FAMILY.

The sufferings to which poor emigrants are sometimes put in travelling from one part of America to another, may be conceived from the following affecting notice in the *Buffalo Commercial Advertiser*:—

"Amid the cold and searching rain, when the stout and well-clad pedestrian was seen enveloped in wool and waterproof boots, a group of nine persons—a mother and eight children—were seen huddled together under the eaves of a warehouse on the wharf. They were cleanly dressed, yet exhibiting those never-failing marks which silently bespeak the indigent. The mother was young for one who had reared such a circle; and her calm, resigned demeanour, indicated that she was no stranger to those inculcations so strongly and feelingly set forth in the family Bible. Her oldest child was a daughter, in height equal to the mother, who stood by the little brothers, endeavouring to keep them comfortable with her scanty cloak, while a consoling word diverted the oft-repeated inquiry for bread.

Their history is soon told: 'I came,' said the mother, 'from Calais in Maine, and I am on my way to Cincinnati, where my husband is. He left home last spring, and after reaching Ohio, got an interest in a piece of land; but I fear he has been unable to keep it, as his means were very limited. Should I and the boys reach him, I think we could do much to aid in clearing the land, and perhaps earn some money to pay for it.'

To a question as to the mode of travel from that place of her departure, she replied—'On leaving home, which was on the 11th of August, we took a stout horse and waggon, in which we put our clothes and victuals. The children and myself, including an infant eleven months old, took turns to ride awhile, but finding the animal to fail, we finally took the road and trudged along until we reached Roxbury, Massachusetts. Here the youngest child was taken sick, and continued to decline until the 4th of October, when it died. During our stay in Roxbury, the oldest girl and one of the boys worked in a bookbindery to assist in supporting us, but the small sum they obtained for their services was totally inadequate to meet our daily expenses and those incurred by the death of the child. However, we succeeded in getting away from the place, and in due time reached Providence, Rhode-Island, where I found myself entirely destitute of money. I sold my horse and waggon for twenty dollars, a sum far below their value, and took passage in a packet for New York. From New York I went to Albany, where I had but two dollars left after paying my passage. With that small sum I have reached this place, and am now without money or food of any kind. Indeed, the children or myself have not tasted victuals since last night.'

This was the brief narrative of the poor woman, and her story was given with such faithfulness and sincerity, that to doubt it was impossible.

A statement was made to the board having control of the steam-boat interest, and a *carte blanche* given for her free conveyance to Cleveland, on board the Wisconsin; while a charitable hand furnished as much bread as will suffice the party until they reach Ohio. How they will fare after that, it is impossible to guess."

"We have the satisfaction of informing our Buffalo friend, that the mother and children referred to were not neglected on their arrival at Cleveland. We handed an account to a worthy bachelor friend this morning, who has a bigger soul than body (would we could say as much of his purse). He sought out the needy, and in a few hours raised near forty dollars for their relief, secured a passage to Portsmouth, and sent them on their way rejoicing."—*Cleveland Herald.*

THE DEATH OF THE DEER.

He sleeps on the sward where he gamboll'd but now,
With speed in his footsteps and pride on his brow;
There's gore on his antlers, there's mist on his eye;
And o'er the dead gallant I breathe a deep sigh.

No more through the woodlands thou'lt bound in thy glee,
Thou son of the swift foot—thou type of the free!
No more o'er the hill top pass by like a dream,
Nor rest in the green shade, beside the clear stream.

Scarce felt the red heather the touch of thy feet,
'Twas so light and so tender, so graceful, so fleet;
And the eye scarce beheld thee, ere thou wert again
Far up the steep mountain, or down the dark glen.

The bolt of the huntsman hath wounded and slain;
Yet skill'd though his hand be, and short though the pain,
I greet not his triumph, but sadly deplore
That the voices of morning shall wake thee no more.

The wood-dove and linnet shall sound in the trees,
And the call of the cuckoo float past on the breeze;
The horn of the hunter shall ring far away,
And children's glad voices be heard at their play;

The streamlet shall murmur like mother's soft song,
And mirror the wild flowers while wand'ring along;
'Twill woo thy fair image to seek it once more,
But thou shalt be missing from stream and from shore.

The dew-drop shall gem the sweet primrose at morn,
And fragrance diffuse from the boughs of the thorn;
But *thou* shalt be absent from hill and from plain,
And the doe and the young fawn shall seek thee in vain.

A. G.

DUPES TO OURSELVES.

We are all greater dupes to our own weakness than to the skill of others; and the successes gained over us by the designing, are usually nothing more than the prey taken from those very snares we have laid ourselves. One man falls by his ambition, another by his perfidy, a third by his avarice, and a fourth by his lust; what are these but so many nets, watched indeed by the fowler, but woven by the victim?—*Lacon.*

THE PLEADER.

That the object of judicial pleading is often less to elicit truth than to hide it, is thus touched upon in a late number of the Dublin University Magazine:—

"The wretch stained with crime, polluted in iniquity, [commits his case to the cleverest lawyer he can hire]; and the trepidation or the indifference that he manifested before, now gradually gives way, and almost unconsciously he becomes deeply interested in the changes and vacillations of the game, which he believed could have presented but one aspect of fortune. But the prisoner is not my object: I turn rather to the lawyer. Here, then, do we not see the accomplished gentleman, the finished scholar, the man of refinement and of learning, of character and station, standing forth the very embodiment of the individual in the dock? Possessed of all his secrets, animated by the same hopes, penetrated by the same fears, he endeavours, by all the subtle ingenuity with which craft and habit have gifted him, to confound the testimony, to disparage the truth, to pervert the inferences of all the witnesses. In fact, he employs all the stratagems of his calling, all the ingenuity of his mind, all the subtlety of his wit, for this one end, that the man he believes in his own heart to be guilty, may, on the oaths of twelve honest men, be pronounced innocent.

From the opening of the trial to its close, this mental gladiator is an object of wonder and dread. Scarcely a quality of the human mind is not exhibited by him in the brilliant panorama of his intellect. At first, the patient perusal of a complex and wordy indictment occupies him exclusively; he then proceeds to cross-examine the witnesses, flattering this one, browbeating that, suggesting, insinuating, amplifying, or retrenching, as the evidence would seem to favour or be adverse to his client. He is alternately confident and doubtful, headlong and hesitating; now hurried away on the full tide of his eloquence, he expatiates in beautiful generalities on the glorious institution of trial by jury, and apostrophises justice; or now, with broken utterance and plaintive voice, he supplicates the jury to be patient, and be careful in the decision they may come to. He implores them to remember, that when they leave that court, and return to the happy comforts of their home, conscience will follow them, and the everlasting question crave for answer within them, were they sure of this man's guilt? He teaches them how fallacious are all human tests; he magnifies the slightest discrepancy of evidence into a broad and sweeping contradiction; and while, with a prophetic menace, he pictures forth the undying remorse that pursues him who sheds innocent blood, he dismisses them with an affecting picture of mental agony so great, of suffering so heart-rending, that, as they retire to the jury-room, there is not a man of the twelve that has not more or less of a personal interest in the acquittal of the prisoner.

However bad, however depraved the human mind, it still leans to mercy; the power to dispose of another man's life is generally sufficient for the most malignant spirit in its thirst for vengeance. What, then, are the feelings of twelve calm, and perhaps benevolent men, at a moment like this? The last words of the advocate have thrown a new element into the whole case, for, independent of their verdict upon the prisoner, comes now the direct appeal to their own hearts. How will they feel when they reflect on this hereafter? I do not wish to pursue this further. It is enough for my present purpose that, by the ingenuity of the lawyer, criminals have escaped, do escape, and are escaping, the just sentence on their crimes. What, then, is the result? The advocate, who up to this moment has maintained a familiar, even a friendly intimacy with his client in the dock, now shrinks from the very contamination of his look. He cannot bear that the blood-stained fingers should grasp the hem of his garment, and he turns with a sense of shame from the expressions of a gratitude that criminate him in his own heart. However, this is but a passing sensation; he divests himself of his wig and gown, and, overwhelmed with congratulations for his brilliant success, he springs into his carriage and goes home to dress for dinner—for on that day he is engaged to the Chancellor ——, the Bishop of ——, or some other great and revered functionary, the guardian of church or the custodier of conscience.

Now, there is only one thing in all this I would wish to bring strikingly before the mind of my readers, and that is, that the lawyer, throughout the entire proceeding, was a free and willing agent. There was neither legal nor moral compulsion to urge him on. No; it was no intrepid defence against the tyranny of a government or the usurpation of power—it was the assertion of no broad and immutable principle of truth or justice—it was simply a matter of legal acumen and persuasive eloquence, to the amount of fifty pounds sterling."

It should, we think, have been added, that the system here deprecated is scarcely separable from the humane principle of allowing criminals to plead through skilled advocates; and that it is better one villain should escape by such assistance than that innocent individuals should suffer. It is the business of juries to disregard all claptrap appeals to feeling, and only act according to strict justice.

The publishers of Chambers's Edinburgh Journal occasionally receive letters from persons complaining of an inability to procure back numbers to complete sets, the booksellers to whom application is made, saying "they are out of print;" it is therefore now intimated, that of every number from the commencement of the work *the publishers possess at least a thousand copies*, and also the stereotype plates for printing more if required. If any one has failed in procuring supplies of back numbers, a mistake of some kind must have occurred in making the application.

NUMBER 528. SATURDAY, MARCH 12, 1842. PRICE 1½d.

THE EVENT.

THE event is always a decisive matter. It weighs not how rash or absurd the attempt was, if it turns out well, nor how sagely devised and spiritedly and industriously executed, if it turns out ill. We naturally have an affection for men who successfully accomplish any thing, and an equally natural and unavoidable antipathy for those who fail. In the latter case, we may allow upon his showing that the man did every thing that could be done, and deserved success; but yet we wish him out of our way. His reclamations against censure are decidedly not relished. He is blameless, yet detestable. And, what always adds so much to our impatience with the well-meaning blockhead who fails, we could have all along told him how much he was in the wrong in all his plans, and how easily, by a very slight change of tactics, he might have succeeded. It is the best policy of all such men to say as little as possible in their own defence. Calling for justificatory court-martials is a poor shift. They should strike their lights and go into oblivion the instant that fortune has greatly declared against them.

If Cæsar, two days after landing at Deal, had been cut to pieces by a painted army, how they would have shaken their heads a fortnight after in Rome, at the desperate nature of his expedition to the tight little island!—and how would all subsequent historians have set it down as only the consequence that was to have been expected from his unpardonable temerity! Had Columbus not reached America—and assuredly he did not expect to reach an America at all, but only Asia by a new route—and had he returned with the loss of half his men to Palos, we cannot doubt that, for fifty years at least, he would have been regarded as a wretched dreamer, who, to gratify his own frantic spirit of adventure, had sacrificed many valuable lives. Fortunately for him, America had pitched itself at a proper distance across the Atlantic, and he gained the credit of discovering a new world. On how many chances did the greatness of Cortez hang! Had he been cut off on the causeway of Mexico, or even had Narvaez overthrown him, his attempting to subdue a great semi-civilised empire with less than three hundred men, would have gained him a place only amongst the coxcombs of history. As it was, every body sees the vast influence of European arms and skill amongst barbarians, and what a clever fellow Cortez was to calculate all this so nicely. So also, when intelligence reached England of the late destruction of British troops in Affganistan, it became very clear to many that they had always thought there was danger in carrying our arms beyond the Indus; although there can be no doubt that, if all had gone on well, such a recollection would never have occurred to any body. The first events of the Chinese war were very satisfactory, and no one insinuated a doubt as to the way in which it was carried on. By and by, however, it proved that the Chinese were troublesome from their duplicity, and then every body thought that they had always thought that these celestial gentlemen should have been more sharply dealt with, and that the manager of the war was infinitely too soft for a command in warlike affairs. The very necessity which people feel of accounting for all things, helps to drive their horns into the sides of the unsuccessful. They must "see how it was," and be able "not to wonder now;" and for this purpose assigning simple stupidity to the hero of the failure answers exactly. It cuts the Gordian knot at once. This is one reason why the unfortunate gentleman has no chance. All his efforts at explanation go counter to a judgment already formed, and which cannot conveniently be surrendered. The non-success of Prince Charles, in his expedition in 1745, is usually ascribed to his having stopped six weeks in Edinburgh after the first good stroke at Prestonpans. Hear what has been said on this subject by a respectable gentleman who was in his army, and knew the whole circumstances, favourable and unfavourable:—"Those who judge of things only by the event, will condemn this measure, and decide positively that if the Prince had marched on from the field of battle, he would have carried all before him. As the Prince's affairs were ruined in the end, it is natural to wish he had done any thing else than what he did: things could hardly have turned out worse, and there was a possibility of succeeding. But to judge fairly of the matter, we must have no regard to what happened, but to what was then most likely to happen. The Prince had but 3000 men at the battle, where he had 100 at least killed and wounded; he might reckon upon losing some hundreds more, who would go home with the booty they got: so that he could not reckon upon more than 2500 men to follow him into England, whence he had no intelligence, no hopes of being joined, no resource in case of a misfortune. But what would the public have said of such an attempt had it miscarried?" * Ay, there is the rub—what would they have said of such an attempt had it miscarried? There cannot be the least doubt that, had Charles and his kilted followers been swallowed up by a conglomeration of English troops somewhere in Westmoreland or Lancashire, the very same persons who blame him for stopping to recruit in Edinburgh, would have laughed to scorn the idea of his invading hostile England with a handful of half-armed mountaineers.

A rising against constituted authorities is at first a rebellion. If put down, a rebellion it remains; but should it be successful, it becomes a revolution. To the idea of rebellion a stigma is always attached; but a revolution is a respectable thing. So much is the difference between failure and success. This is the principle involved in the trite adage, "Treason is ne'er successful," &c. When the aim involved in the treason is successful, it takes a totally different character, and thus escapes the obloquy. We cannot doubt that the chiefs of many rebellions have been better men, and animated by more disinterested views, than the chiefs of many revolutions. It is no matter: the public deals in this respect very much as Lycurgus with the detected thief. Failure stamps the one party infamous, while success puts the less deserving high in Fame's temple. There is no appeal. Even the historian, writing at the cool distance of centuries, feels the instinctive repugnance to the unsuccessful man, and sets himself to pick all possible holes in his coat with the greatest deliberation. With the same earnestness does this gentleman seek to discover proper elements of success in him whom fortune has favoured. Many great things take place through a fortuitous concurrence of trifling circumstances; but we do not receive this idea readily. It always seems as if great things should have great causes. In such a case, for example, as that of Henry de Guise, who went in a herring-boat and made himself king of Naples, a historian, if he is a natural sort of person at all, cannot conceive how such a thing could be merely the frolic of a young mad-cap. He would deem it necessary to show a long train of important circumstances leading to the expedition. He would trace the character of Henry's mind from his education, his mother's working at a tapestry of the wars of the Titans, and the fondness of his pedadogue for Plutarch, which the young duke would be sure to have read twice over, manifesting a particular partiality for the life of Alcibiades. Then there would be much in the state of Europe at the time—Cromwell newly made master of England, France just respiring from the wars of the Fronde, &c. Henry's few companions would be made out very remarkable men, and there would be reason to suppose that he had been invited by some of the chief of the Neapolitan nobility. Now, possibly, not one of these circumstances, allowing that they all existed, was of the slightest moment in the case. Strictly investigated, the expedition seems to have been little more than a frolic, which, from chance circumstances, ended in its hero gaining a temporary crown. Perhaps, if he had been asked to relate the wonderful story of his expedition, he would have frankly replied, in the words of the knife-grinder, "Story! God bless you, I have none to tell, sir." He would only know that he had had a sort of pleasure-sail to Naples one day, and that the people had insisted on his becoming their king. This necessity of finding out causes of sufficient dignity for all things, is one of the banes of history. Half the great operations of the world are brought about by means infinitely beneath an Helen's beauty or an Achilles's wrath; but these things do not tell well in grave pages. We must have a view of the state of the world at the time, a great deal about the deeply-seated springs of human conduct, and some speculations as to how far the recollections of long past injuries still rankled in the bosoms of the Greeks.

A great deal of the wisdom of the common world is determined by the event. The character of many transactions is only apparent to a great part of mankind after they have taken place. But when it is an affair of their neighbours, they always suppose that they were all along quite aware how things were going. It was easy to see how such a scheme would turn out. They could have foretold all this months ago. Some little point is fastened on as having given them full assurance that the thing was doomed to failure. Honest Gideon Pike was quite sure, *after* the battle of Loudon-hill, that the dragoons could not fail to be beaten, as "little gude could come o' that new-fangled way of slinging their carbines." It is most unfortunate that we only have this prescience about each other's affairs, and not about our own, for, if it were so far extended, nothing would ever happen amiss. At present, limited as the prescience is, there is scarcely any use for it, unless as a means of giving a friend a little salutary affliction, in the hope of making him more cautious for the future. This, I need scarcely say, is to be done by rounding in his ear, at the moment of failure, such phrases as—"I told you so;" or, "All this is just what might have been expected." In the science of ingeniously tormenting, the post-eventual prophet stands as an artist of the highest class. A thorough-bred one takes care never to commit himself before the event. He acts in the spirit of the Vicar of Wakefield, when, in reply to his wife's exultations about the prospects of her daughters from the town ladies, he exclaimed (not knowing well what to think of the matter), "Ay, Heaven grant they may be both the better for it this day three months!"—an observation which, if the girls succeeded, might be looked on as a pious wish fulfilled—otherwise, as a prophecy. Upon the whole, it is safest to take the unfavourable side of the case, and rather hint at disaster than foretell triumph, for, when triumphs do result, no one remembers the croaker or his forebod-

* Narrative of Charles Prince of Wales's Expedition to Scotland in the year 1745. By James Maxwell of Kirkconnell, Esq. Printed at Edinburgh, 1841. 4to.

ings, whereas, in the contrary event, he may recall even a long-past shake of his head as a proof of his sagacity.

Perhaps our prepossession in favour of the successful, and our dislike to those who fail, has a final cause in the effect which it is calculated to have, in prompting to all possible exertion, and all possible caution, for the securing of success. Were the unsuccessful sure of having full allowance for their mere aims, and a light judgment for their defeats, there might be less energy shown in all kinds of transactions, and a great lack of that watchfulness which is so essential to the right conduct of human affairs.

DO AS YOU WOULD BE DONE BY.

THERE are many people living in the world, with strictly honest intentions, and who yet, by a mistaken calculation of the degree in which it is permitted to consult their own interest in preference to the interest of others, allow themselves to persevere in the practice of a certain species of selfish injustice, so pernicious in its effects, that the injury they inflict upon society, and consequently the crime they commit, is twenty times greater than a vast proportion of the offences which conduct their unhappy perpetrators to the gallows. Perhaps some of our readers may think we are too energetic in our denouncement, when they learn that the criminals we point at, are neither more nor less than *dilatory bill-payers*—people who, for the sake of avoiding a small proportion of inconvenience to themselves—a slight sacrifice on the interest of their money—a little self-denial, in short, in some shape or another—do not hesitate to inflict on their unhappy victims an amount of misery, from the idea of which they would recoil with horror did they pause to estimate its enormity. And it is a terrible aggravation of this offence, that the sufferers from it are usually amongst the most hard-working, the most industrious, the most struggling members of the community; in a word, they are precisely those who are most anxious to do well, and who have the greatest difficulties to contend with in effecting their object. But as an ounce of example is sometimes better then a pound of precept, we will proceed to our story.

The night was dark, the weather was very cold, the snow lay three feet deep upon the ground, and was still falling, whilst the wind that came in cutting blasts, dashed and rattled against the windows of the room where sat Mr and Mrs Wingate. But the picture presented by the interior offered a very agreeable contrast to the scene outside. The fire blazed brightly, the hearth was clean swept, the kettle sang upon the hob, the room was well carpeted and comfortably furnished, the red moreen curtains reflected a warm glow on every object, not excepting the countenances of Mr and Mrs Wingate themselves, who, deposited in well-stuffed easy-chairs, sat on each side of the fire. Mr Wingate had been indulging in a little doze, whilst his wife, by the fitful blaze, had been knitting him a warm lamb's wool comforter; a fat spaniel and a large black cat lay cozily asleep upon the rug, and Betty brought in the tea-things.

"Bring up the brown loaf, Betty," said Mr Wingate, rising to take a turn or two about the room and shake off his drowsiness; whilst his wife unlocked her caddy and prepared to make the tea.

"The baker hasn't sent it, sir," said Betty.

"What's the reason of that?" inquired Mr Wingate, turning sharply round; "wasn't it ordered?"

"Yes, it was, sir," said Betty; "but I suppose, as the night is so bad, and it's a good way to bring it, they've left it till the morning."

"That's very neglectful," observed Mr Wingate; "they might have known very well that it would be wanted for tea. I shall leave Duncan and go to somebody else for my bread, if he is not more attentive. What's this?" added he, taking up a folded paper that Betty had introduced upon the tea-board.

"That's Duncan's bill, I believe, sir," replied Betty; "their man left it when he was here this morning."

"Oh!" said Mr Wingate, throwing it over to his wife, without opening it; "he's in a greater hurry with his bill than he is with our loaf—he might have waited till the year was up, I think. How much is it, Margaret?"

"Gracious me! it's twenty-five pounds, I declare!" exclaimed Mrs Wingate, as she looked at the sum-total that closed an account of several pages; "I had no idea we owed him so much."

"Twenty-five pounds!" re-echoed Mr Wingate, stretching out his hand for the paper. "Surely there must be some mistake."

"We shall see by the book," answered Mrs Wingate; "every thing we get is regularly set down; but I certainly did not expect it would be so much." And here we must take leave to remark, that disagreeable surprises of this nature are the inevitable lot of every body that runs long accounts; so that the little pecuniary advantage they may have reckoned upon by delaying their payments, is materially counterbalanced by the irritation consequent on these unpleasant discoveries, and also by the prejudicial effects of their miscalculation, which causes them to overrate their resources, and beguiles them to spend when they should spare.

"How long have we been dealing with Duncan?" inquired Mr Wingate, feeling for his spectacles.

"About a year and a half—ever since he came into that shop," answered his wife.

"Amount of account rendered December—amount of account rendered June—how was it his bill wasn't paid last Christmas?" asked Mr Wingate, sharply; for we must here take leave to slip in another little observation, which is, that when these long accounts unfold their ungainly proportions to our view, we inevitably feel vexed and angry, not only with the tradesman but with ourselves—or more commonly, indeed, with our wife—both because that is more convenient and agreeable, and because these housekeeping accounts generally belong to her department.

"Why," answered Mrs Wingate, "you know we barely owed him half a year last Christmas, and I did not see any necessity for settling it till June; and then, when I asked you for money, if you recollect, you said that the purchase of the railroad shares had taken all you had, and that you couldn't pay any body till Christmas."

"This must be settled at the New Year," said Mr Wingate—"that is, if you find it's correct; I can hardly believe our bread bill for eighteen months can come to so much, though. Do we owe any body else more than a year?"

"I believe not," replied the lady; "I think every thing was settled up to last January—that is, the house-keeping accounts—the repairs, and the painting, and all that sort of thing, you know best about yourself."

"Oh, it's time enough for that," replied Mr Wingate; "those sort of people don't expect to be paid under two years; but the house-keeping bills, certainly, should not run beyond twelve months. What's that?—another bill?" continued he, as Betty, on being summoned to take away the tea-things, laid a second paper on the table.

"It's Dimond, the green-grocer's bill, sir," said Betty; "I found it at the bottom of the basket."

"Humph! fifteen pounds for vegetables and fruit in one year," said the gentleman; "that's a great deal, Mrs Wingate."

"It does seem a great deal, to be sure," replied the wife; "and yet we never have any thing the least out of the way: one can't do without vegetables, or without a little fruit, when it's in season, you know."

"Certainly not; there's no necessity for doing without them, thank God!" answered Mr Wingate, who, however disagreeably affected by the sight of the bills, had no idea of denying himself the good things of this world; "only, you should be particular about these people's accounts, and take care that they don't overcharge us, or run up their bills by putting down things we have never had. There seems to be an amazing quantity of strawberries here in this bill of Dimond's!"

"I believe we had a good many strawberries when the children were at home for the holidays," replied the lady.

"Well, all these things must be paid as soon as we can spare the money," said Mr Wingate, throwing them over to his wife, and taking up his book.

"By the by, Mrs Gibson, the milkwoman, sent in her account yesterday; she says she has a bill to make up, and would be very much obliged if we could settle it."

"I can't pay any body till after Christmas," said Mr Wingate, dryly; "they needn't be in such a hurry; they know very well they are sure of their money. I'm not sure that I may not be called upon to pay up another instalment upon my bank shares. I heard something of it the other day."

"Why, isn't the bank doing well?" inquired Mrs Wingate.

"Oh! capitally," replied her husband; "but, you know, every thing must have a beginning, and there are always difficulties at first; but I expect those shares will pay me ten per cent. at least."

"Well, I am glad of it, Wingate," replied the lady; "for, if that and the railway both turn out well, I hope we may be able to keep a little four-wheeled carriage and a pony—it would contribute very much to my comfort."

"Perhaps we may," answered Mr Wingate, nodding his head complacently; "especially if I can get a few more of those railway shares. I heard there were some likely to come into the market."

"Indeed!" answered the wife; "I thought they had all been bought up."

"So they were," replied he; "but Duncan's wife had ten shares—her father left them to her when he died—and I hear they are likely to be sold, at least I had a hint of it; and I have employed a person that knows Duncan to find out if it is so, that I may get the first chance."

"I should hardly think he'd part with them, when they are likely to pay so well," observed Mrs Wingate.

"I fancy the new shop hasn't answered so well as he expected," replied her husband; "they say he was doing better in the old one."

It was quite true—he was doing better in the old one—but why? We shall see.

Duncan's former shop had been in an unfavourable situation—a poor neighbourhood; nevertheless, he had a steady little business, and regular though small profits. But having married a young woman who had a little matter of money, he thought it would be for their mutual interest to lay it out in fitting up a shop in a better situation, amongst more affluent people. The spot he fixed upon was just on the outskirts of the town, where there was a line of villas stretching for a mile or two into the country; and as there was no baker nearer than himself, he naturally looked to getting a tolerable share of business. And so he did; for he made good bread, and his proximity was a convenience; so that their fortunes wore a flourishing aspect, and they congratulated themselves on the success of their experiment. But it was unfortunately the custom amongst a vast proportion of these worthy people to pay their bills but once a-year, whilst Mr Duncan, and his wife, and little child, wanted to eat every day, Mr Duncan's journeymen wanted to be paid every week, Mr Duncan's rent became due twice a-year, and Mr Duncan's corn-merchant and other purveyors sent in their bills at the end of every six months. These opposite arrangements did not tally at all. Mr Duncan had plenty of business, and as his customers were mostly respectable and careful people, he reckoned upon few bad debts; but then, in the mean time, he had no money to go to market with, nor to pay his way, and consequently he was obliged to take long credits, and bought every thing at a disadvantage. Thus, he was always in difficulties—always struggling, always put to his shifts how to get on, and his mind was never at ease; whilst, to his infinite annoyance, he was often obliged to inflict on his own tradespeople the same inconvenience that his customers inflicted upon him.

It was early in December, on the night that we have introduced our readers to Mr and Mrs Wingate, that Mr Duncan sat on one side of a little table in his back-parlour, making up his bills, whilst his wife was employed with her needle on the other.

"Bless me!" cried he, "there was a brown loaf ordered for Mr Wingate to-night; I fear it has not been sent."

"No," replied his wife, "I had nobody to send with it; George did not come back from his rounds till it was too late; so, as they could not get it for tea, I thought it would be better to send a new one to-morrow morning."

"I am afraid George will never do for us," replied Duncan; "he's terribly slow."

"He's worse than that," responded the wife; "he's idle and careless."

"Ah!" said Mr Duncan, with a sigh; "we shall never get such another as William—he was such an excellent steady lad."

"So he was," said Mrs Duncan; "we have never had one to suit us since. It was very provoking that he should have left us."

"I can't blame him," answered Duncan. "You know he had his mother to keep out of his wages, and how could he do that if he did not receive them regularly?"

"Very true," answered Mrs Duncan, in a despondingtone; "we shall never be able to keep a steady man if we can't pay him regularly; and then we lose our customers through the carelessness of the journeymen. There was Mr Donaldson left us because he did not get the rolls time enough for dinner the day he had company, and Mrs Wilson because she saw that last boy we had playing tricks in the street, whilst he set down his tray in the rain, and let the bread get wet."

"It's very true," answered Duncan; "but the thing that weighs most upon my mind at present is this forty pounds of Thomson's. How I am to get it together, I'm sure I don't know; and I am very well aware that he can't afford to wait any longer for it. He has given me all the indulgence he can, but now he has a bill coming due, and I must pay him, if I sell my railroad shares to do it."

"If Mr Wingate would pay his bill, there would be five-and-twenty pounds towards it," observed Mrs Duncan. "Surely, I should think he would, now that it has run eighteen months."

"He'll pay it at the New Year, or soon after, I dare say," replied Duncan; "but the thing is, will he pay it now? If I press for it, perhaps he'll take offence, and we shall lose his custom altogether."

"And, I'm sure, we might almost as well lose it," said Mrs Duncan; "for people's custom does very little good when they take such long credits."

"That's very true," replied the husband; "but one don't know what to do—in offending one, we offend others; few people will take the trouble to consider the distress they put us to whilst we are waiting for their money, and they fancy, if we press for it, that we are distrustful or insolent."

Not far from where this conversation was held, in a

little lodging below the street, over which was inscribed, "Milk and Cream sold here," sat, on the same evening, Mrs Gibson and her lame son, a poor lad that from his birth had been a cripple. A very little bit of fire burned upon the hearth, a single rushlight that stood upon the table just redeemed the room from darkness, and a couple of red herrings, a loaf of bread, and a little butter-milk, were spread for the evening repast. The lad drew to the table and began to eat, but Mrs Gibson sat with her eyes fixed upon the fire, in an attitude of deep thought, and with a countenance on which care and anxiety were legibly imprinted.

"Come, mother," said David, "you had better try and eat something; sitting there grieving won't do any good —care killed the cat, you know."

"How little people that are well off think of the difficulties that we poor folks have to struggle with!" said Mrs Gibson, without attending to her son's invitation. "Surely, if they knew the distress they put us to, they'd never do it, just for the sake of keeping their money in their pockets a little longer."

"But don't the rich people get interest for their money, mother?" inquired David.

"I suppose they do, and that that is partly the reason of their not liking to pay it away," replied Mrs Gibson; "but then they should consider that they take their interest out of our pockets. It don't signify, I dare say, to some of the rich tradespeople; they can afford to stay out of their money, because they can get credit themselves; and besides, when they know they are not to be paid for a good while, they charge accordingly. But I can't do that; I can only charge a penny a-pint for my milk, whether I'm paid for it to-morrow or next year; and, in the mean while, how am I to keep a house over my head, or buy fodder for my cows, or live at all? People wont give much trust to a poor woman like me."

"But you'll get your money from them at Christmas, mother," said David, "or soon after; and that isn't long now, you know."

"Ah, my dear," replied Mrs Gibson, "it will be too long for me. I must get some before Christmas."

"What for?—is it for the rent?" asked David.

"No," answered the mother, "it's not for the rent."

"What is it for, then?" inquired David.

"I don't know whether to tell you or not, dear," said Mrs Gibson. "But you're a good boy, David, and I think I will, for it will be a relief to my mind. Well, you know, a little while ago, when Colley the black cow died, I was obliged to look out for another, and as it was just before the cattle-fair at F——, I'd a mind to go there and get one, but I could not scrape money enough together for the purchase. Unluckily, just a day or two before the fair, as I happened to be writing to your brother John, I mentioned this, and said what a loss it would be to me, and that it was very hard, as, if I had all the money that was owing to me, I could have bought the best cow in the market—or something like that. Well, to my surprise, there comes by return of post a letter from John, with a ten-pound note in it, saying that a friend had lent it him, but that I must be sure to pay it again before Christmas. I wish to my heart I had not taken it, but I thought, to be sure, I should be able to return it in time."

"Well, I'm sure, mother, you'll be able to get ten pounds from your customers by Christmas!" said David; "many of them owe you six months, and some a whole year."

"Ay, David, but the thing is that I want it now. Yesterday there came a letter from John, to say that I must send him the money before the fifteenth; 'Be sure you do, mother,' he says, 'even if you are obliged to sell the cow again to get it.' Well, I made up the accounts of some of those I thought most able to pay me, and took them in; but to-day there comes another letter from John, begging me to make all the haste I can about the money, and he says in it, 'I did a very wrong thing, mother, for the sake of sending you that ten pounds—a thing that I am very sorry for now, and that I had rather cut my hand off than do again, if I can only get over it this time; but, oh, mother, send me the money!'"

"What can he mean?" said David, with a look of alarm.

"I'm afraid he has done something he should not do," said Mrs Gibson. "I'm afraid the money was not lent him, as he said, but that he got it some other way—perhaps it was his master's—Heaven knows!"

"Oh, mother!" exclaimed David, "you don't think John would take what wasn't his own?"

"There never was a better lad than John, dear," said Mrs Gibson; "but young people sometimes do things in a hurry, without stopping to think of the consequences of their actions; and, you know, he was always thoughtless; and then he's very soft-hearted, and over-good-natured, and I'm afraid I complained a good deal of the hardship of being kept out of my money. I hope I may be wrong, but I'm afraid John is in some trouble."

"We must sell one of the cows, mother," said David, with a good deal of agitation in his manner; "you'll sell her to-morrow, won't you?"

"If I can't get my money, I'll sell her," replied Mrs Gibson; "but you see what a loss it will be. We shall then have but one left to keep us through the winter; besides, I know nobody that wants a cow just now, and perhaps I may not be able to sell her—at least not for so much as ten pounds. However, I have taken in the bills, and left word that I should be very much obliged for the money; and to-morrow we shall see."

This story seemed to have spoilt poor David's appetite for his bread and his red herring. He was a lad of great sensibility, weak health, and nervous temperament, and, withal, exceedingly fond of his brother. The idea of the disgrace and perhaps danger that might await John if the money was not quickly sent, seized on his imagination; he could not sleep all night for thinking of it, and lay tossing on his humble couch, impatient for the daylight that would enable his mother to set about some means of collecting the necessary sum.

"You'll make yourself ill, David dear," said his mother; "wait patiently till I come back, and I hope I may bring you some good news;" and Mrs Gibson set off to learn what hopes there were from her customers. But when she inquired of the several servants if they had handed her little account to their employers, the general answer was, "Mistress says you'll be paid at the usual time," or "Mistress laid it by, and didn't say any thing;" whilst Dimond, the green-grocer, and Duncan, the baker, and the tradespeople in general, answered, "We can't get in our own accounts, but as soon as we do, you shall be paid."

"Then we must sell the cow, mother," said David, whose pale cheeks looked flushed with anxiety; "who do you think will buy her?"

"I don't know, I am sure," answered Mrs Gibson; "but I'll see about it to-morrow. But you are not eating any dinner, David."

"I can't eat, mother, till John has the money," replied David.

But it was easier to talk of selling the cow than to do it; nobody that Mrs Gibson could hear of wanted one—at least, nobody that had the money in their hands ready to pay down; and there was no cattle-fair or market at the moment, where she might have been disposed of; and two days elapsed without producing any relief to the anxiety of the mother and son, whilst another pressing letter arrived from John, entreating that the money might be sent without delay. This was too much for poor David; by the third night he was in a high fever, and obliged to take to his bed. Here was an aggravation of misery! His mother could not leave him, for she had nobody to take her place by his bedside; she engaged a girl to carry out her milk, but she could no longer make any exertions to procure the money, and David's consciousness of this circumstance cruelly aggravated his sufferings. By the evening of the fourth day, his mind began to wander, and he was so ill, that Mrs Gibson, not satisfied with the advice of the young student that she had first applied to, determined to request the attendance of a physician, and her neighbours recommended her to go to Dr A. "He is an excellent man," said they, "and always willing to assist the poor."

"There's a great deal of fever, indeed," said Dr A., when he saw the lad; "but there are no particular symptoms at present, by which I can judge what it is to terminate in. Has he been where there's any infection, that you know of?"

"No, sir," replied Mrs Gibson, "I don't think it's any thing of that sort—being quite a cripple, poor boy, he went little about. No, sir; I believe it's something else."

"What else do you mean?" asked Dr A.

"I fancy, sir, it's some anxiety about his brother and a little matter of money"——

"Have you got the money for John, mother?" said David, suddenly opening his eyes, and recalled to consciousness by the words that had struck upon his ear.

"Keep yourself quiet, dear, and I shall get it, never fear," said Mrs Gibson. "Yes, sir, it's entirely that, I'm certain, that is the matter with him. He was always a delicate boy, but he was as well as usual till this distress came upon him."

"I'll see him again to-morrow," said the doctor, when he had written his prescription; "and in the mean time you must soothe him as much as you can. Keep his mind easy." But that was not to be done: when David was delirious, he raved about his brother and the money; and in his more lucid intervals, he inquired without ceasing if his mother had got it, and begged her to show it him.

"I believe, sir, if I could just show him a ten-pound note, so as to make him believe I have sold the cow, it would do him more good than all the physic in the world," said Mrs Gibson, on the following day, to the doctor. "I'll try and borrow one of somebody for a minute or two."

"I haven't one about me, or we might try the experiment immediately," answered Dr A., whose interest and curiosity were awakened by this fraternal anxiety; "but what is the cause of his brother's distress?"

"It was his desire to assist me, sir," replied Mrs Gibson;" and then she related the circumstances of the case, taking care, however, not to hint what she suspected, namely, that John had not come rightly by the money; but the doctor's sagacity supplied what she withheld.

"And is it from losses in your business that these embarrassments have fallen upon you?" asked he.

"Oh, no, sir—not from losses," answered Mrs Gibson; "I shall get all my money by and by, for they are very respectable people that owe it me. But those that are well off don't think what inconvenience they put us poor people to by keeping us out of our money so long; they forget that we have our daily little expenses to provide for, and our rent, and the fodder for our cows; and that accidents happen that we can't reckon upon: and that, if we can't go to market with the money in our hands, we buy every thing at a disadvantage. And then, sir, the tradespeople, that know all this, and would pay us if they could, can't do it, because they are kept so long out of their own money."

"This is all very bad," said Dr A., "and must doubtless be the occasion of many bankruptcies amongst the class of small tradespeople who have little or no capital, but depend upon the profits of their daily sales."

"The profits are all eaten up, sir, by the long credits; and if we get a bare living, it's all we can do. As for laying by any thing for a rainy day, it's out of our power. We are always struggling, always behind, and living from hand to mouth."

"With respect to your present distress, however," said the doctor, "if any one were to advance you the ten pounds, when could you repay it?"

"About Christmas, sir, or soon after," answered Mrs Gibson; "it should be the very first debt I would discharge."

Dr A., good man, advanced the money, and John was saved; but poor David had received his death-blow. His weak constitution and shattered nerves could not recover the shock, and he died in his mother's arms; comforted, however, by knowing that the money had reached his brother in time to prevent the calamity that had been apprehended. The neighbours said that the poor cripple's death was a release, and that his mother would have a mouth less to feed; but, alas! for many a long day her own solitary meal was watered with salt tears, and many a long evening she sat by her bit of fire, gazing on poor David's empty chair, picturing his kind, pale, loving face, and conjuring up sad memories of days gone by—never, never to return.

Mr Wingate kept his pony-chaise, and continued to pay all his bills punctually at Christmas, or soon after, and he thought himself a very good customer to his tradespeople; but Mr Duncan was obliged to sacrifice his railway shares, which would ultimately have brought him ten per cent., in order to pay his friend Thomson the forty pounds he had lent him. Mr Dimond, the greengrocer, was not long after obliged to give up his business, for he had no capital, and he found it impossible to provide himself with his merchandise in the markets, when he had scarcely ever any money to take there. Poor David was dead, and his mother's hearth was lonely—and these are but a few instances of the ramifications of evil, which spread in all directions amongst the industrious classes, from the selfish, unchristian-like, and pernicious practice of *dilatory bill-paying*.

CHILDREN OF THE WILDS.

THE fact of children being occasionally reared apart from all human society, is one calculated to attract the attention of the philosopher, as well as to excite an interest in the common mind. It might at first appear nearly impossible that a child accidentally lost in a forest could sustain itself and grow to maturity; yet there are several authenticated instances to assure us of the contrary. While this is in itself the solution of a curious problem, we have others to consider in the degree in which the ordinary human faculties are liable to be developed in such circumstances, and the effect which the long dormancy of the most of them is calculated to have in obstructing all future efforts to educate and humanise. With the view of throwing as much light as possible on all these questions, we have brought together a few of the most perspicuously recorded instances of forest-reared children.

The story of the Wild Girl of Champagne is detailed by a trustworthy French writer, M. de la Condamine. One evening, in September 1731, the people of the village of Songi were alarmed by the entrance into the street of a girl, seemingly nine or ten years old, covered with rags and skins, and having a face and hands black as those of a negro. She had also a gourd leaf on her head, and was armed with a short baton. So strange was her aspect, that those who observed her took to their heels, and ran in-doors, exclaiming, "The devil! the devil!" Bolts were drawn in all quarters, and one man thought to ensure safety by letting loose a large bull-dog. The little savage flinched not as the animal advanced in a fury, but throwing herself backwards on one limb, and grasping her club with both hands, she discharged a blow at the head of the dog, as it came nigh her, with such force and celerity as to kill it on the spot. Elated with her victory, she jumped several times on the carcass; after which she tried in vain to enter a house, and then ran back to the wood, where she mounted a tree and fell asleep. Thirst, it was supposed, had led her to the village.

The Viscount D'Epinoy, then in the country, was quickly told of this apparition, and a search being made early next morning, the little wanderer was observed at the top of a lofty tree. Supposing that she was thirsty, they brought a pitcher of water, and set it below the tree. The wild girl, after cautiously looking all around, came down and drank; but being startled, she reascended the tree before she could be approached. In the hope of startling her less, a woman and child were then directed to offer food to her, and entice her down. This plan was successful, and the savage was caught. She struggled violently, but was carried to the house of M. D'Epinoy. In the kitchen, fowls were being dressed at the moment, and she instantly flew on one of them, tore it to pieces, and ate it. An unskinned rabbit was placed before her, which, with amazing rapidity and voracity, she also skinned and devoured.

It was soon found that if the little savage possessed any speech whatever, it was merely a word or two in some foreign or instinctive tongue. The usual sound uttered by her was a wild scream, not articulated, but formed entirely in the throat. If any one approached to touch her, she grew wild, and shrieked violently. She had blue eyes, and, strange to say, it was speedily discovered that her skin was really white, or nearly so, a black paint having been apparently laid on her face and hands. It was noticed that her thumbs were very large, and this was afterwards explained by her as arising from her habit of springing like a squirrel from tree to tree, by resting upon them. Being placed by M. D'Epinoy under the care of a shepherd, she at first gave much trouble by scraping holes in her place of confinement, and flying to the tops of trees or the house-roof, where she was as much at home as on the level ground. She could run with immense speed, and, some time after she was taken, frequently showed her powers by catching rabbits and hares at the request of her patrons. Her food had been raw flesh, fish, roots, fruits, branches, and leaves; and she never chewed her meat, but swallowed it whole. It was found extremely difficult to wean her stomach from the taste for raw food. When first taken, she was allowed by M. D'Epinoy to cater for herself about his ponds and ditches. She swam like a

duck, and was extremely dexterous in diving for and catching fish, which she brought ashore in her teeth, and then gutted and ate. Frogs were a peculiar dainty to her. One day, when presented to a dinner-company at M. D'Epinoy's, she looked around at the table, and seeing none of her own good things, she suddenly ran out to the nearest ditch, where she speedily gathered an apronful of frogs. These she brought into the dining-room, and, before the guests knew her drift, she had spread her collection over the whole of their plates. It may be guessed what consternation was caused by the leap-frog game which then took place.

When she had learned to express her ideas in speech, she informed her friends that she had had a companion, a girl somewhat older than herself, and black, or painted black. They had quarrelled about a chaplet, dropped by some one. The elder girl struck the younger one on the arm, and the younger one returned the blow by a violent stroke of the baton on the brow, which felled the other to the ground, and "made her red," that is, drew blood. Sorry for her companion afterwards, the younger took the skin of a frog and spread it over the wound. They parted, however, each taking separate directions. Before this happened, the pair had crossed a river, which must have been the Marne, three leagues from Songi. It had been their custom to sleep all day in trees, which they could do with perfect safety. The elder girl alluded to was sought for, but was never found. A rumour went that a black girl had been found dead not many leagues from the spot where the other was taken; but as it was long ere the latter could tell the story, the affair could not be unravelled at that distance of time.

Le Blanc, as the little savage was named, had a distinct recollection of being twice at sea, and of latterly escaping with her companion from a ship by swimming. From her statement, it was conjectured that Le Blanc, at least, was from the coast of Labrador, and had been kidnapped and carried to the West Indies. Failing to sell her by the trick of colouring her as a negro, the kidnapper seems to have brought her to some coast near to France. The hazy recollections of Le Blanc, which had reference partly to canoes and seals, and partly to sugar-canes, confirm this conjecture. How long the wanderers had been in Europe it is impossible to say, but it is evident that Le Blanc had been long familiar to solitary as well as savage habits. The attempts made to accustom her to cooked food nearly cost her her life, and her acquired voracity could not be overcome. At the hospital of Chalons, and subsequently in a convent, where she spent much of her after-life, she was civilised, however, in every respect. The Duke of Orleans, and many great people, were kind to her. She was, of course, an object of great curiosity to all. The period of her death is unknown to us, but in 1765 she was still living in Paris. Some peculiarities marked her through her whole life, and particularly a certain rolling motion of the eyes, acquired when she wandered in the woods, and had to guard against surprise. She knew then no fear, however, and hesitated not to front the wolf or wild-cat. Besides the bludgeon mentioned, which she said she brought from *her own country*, she had for defence a stick pointed with iron, which she brought, she said, from the *hot country*.

The connexion she had had with society in early life may be supposed to have in some measure cultivated the intellect of this extraordinary creature. Not so with another noted savage, called Peter the Wild Boy. "He was found in the year 1725, in a wood near Hameln, about twenty-five miles from Hanover, walking on his hands and feet, climbing trees like a squirrel, and feeding on grass and moss; and in the month of November was conveyed to Hanover by the superintendant of the House of Correction at Zell. At this time he was supposed to be about thirteen years old, and could not speak. This singular creature was presented to King George I., then at Hanover, while at dinner. The king caused him to taste of all the dishes at the table; and in order to bring him by degrees to relish human diet, he directed that he should have such provision as he seemed best to like, and such instruction as might best fit him for human society.

Soon after this, the boy made his escape into the same wood, where he concealed himself among the branches of a tree, which was sawed down to recover him. He was brought over to England at the beginning of 1726, and exhibited to the king and many of the nobility. In this country he was distinguished by the appellation of Peter the Wild Boy, which he ever afterwards retained.

He appeared to have scarcely any ideas, was uneasy at being obliged to wear clothes, and could not be induced to lie on a bed, but sat and slept in a corner of the room, whence it was conjectured that he used to sleep on a tree for security against wild beasts. He was committed to the care of Dr Arbuthnot, at whose house he either was, or was to have been, baptised; but notwithstanding all the doctor's pains, he never could bring the wild youth to the use of speech, or the pronunciation of words. As every effort of this kind was found to be in vain, he was placed with a farmer at a small distance from town, and a pension was allowed him by the king, which he enjoyed till his death." Lord Monboddo, whose researches led him to interest himself in Peter, visited him at Berkhamstead in 1782, when the Wild Boy had become an old man of above seventy. The poor creature looked "sagacious for a savage," his lordship says, but could only articulate a word or two. In youth he was peculiarly strong and nimble, but an illness weakened him. He had learned to eat and dress like others, but in many respects he seemed out of the pale of humanity. "He retains so much of his natural instinct, that he has a fore-feeling of bad weather, growling and howling, and showing great disorder, before it comes on. If he hears any music, he will clap his hands, and throw his head about in a wild frantic manner. He has a very quick sense of music, and will often repeat a tune after once hearing. When he has heard a tune which is difficult, he continues humming it a long time, and is not easy till he is master of it.

Till the spring of 1782, which was soon after his illness, he always appeared remarkably animated by the influence of the spring, singing all day, and, if it was clear, half the night. He is much pleased at the sight of the moon and stars: he will sometimes stand out in the warmth of the sun, with his face turned up towards it in a strained attitude; and he likes to be out in a starry night, if not cold. He is extremely good-tempered, excepting in cold and gloomy weather, for he is very sensible of the change of the atmosphere. He is not easily provoked, but when made angry by any person, he would run after him, making a strange noise, with his teeth fixed in the back of his hand.

Of the people who are about him, he is particularly attached to his master. He will often go out into the field with him and his men, and seems pleased to be employed in any thing in which he can assist them; but he must always have some person to direct his actions, as may be judged from the following circumstance:—Peter was one day engaged with his master in filling a dung-cart. His master had occasion to go into the house, and left Peter to finish the work, which he soon accomplished; but as Peter must be employed, he saw no reason why he should not be as usefully employed in emptying the cart as he had before been in filling it. On his master's return, he found the cart nearly emptied again, and learned a lesson by it which he never afterwards neglected." Peter died in 1785, at the farm in Hertfordshire.

Another authentic case of a boy surviving alone in the woods is that of Victor, the savage of Aveyron. "Towards the end of the year 1798, a child, apparently about eleven or twelve years of age—who had several times before been seen in the woods of Caune in France, seeking acorns and roots, on which he subsisted—was caught by three sportsmen, who seized him at the moment he was climbing a tree to avoid them.

How this unfortunate child was at first abandoned to a state of nature, could not be discovered. One circumstance affords room to conjecture that at the time when this took place an attempt had been made on his life. On the fore-part of his neck was a scar of considerable extent, which appeared to have proceeded from a wound made by some sharp instrument. Some persons, more disposed than accustomed to acts of cruelty, had doubtless attempted the life of the child, who being left for dead in the woods, owed to the timely assistance of nature the cure of his wound. Besides this, he had, on various parts of his body, twenty-three scars, some of which appeared to have come from the bites of animals, and others from scratches and excoriations, affording incontestible evidence of the long and total abandonment of the unfortunate youth. From the testimony of the country people who lived near the woods in which he was found, he must have passed in absolute solitude seven years out of the twelve, which was supposed to be his age when caught in the woods of Caune.

When he was first brought into society, he lived on acorns, potatoes, and raw chestnuts, eating husks and all. In spite of the utmost vigilance, he was frequently near escaping, and at first showed great unwillingness to lie in a bed. His eyes were without steadiness and expression, wandering from one object to another, without ever fixing on any. The organ of hearing was equally insensible to the loudest noises and the most harmonious music: that of voice was still more imperfect, for he could utter only a guttural and monotonous sound. He seemed to be alike indifferent to the smell of the most delicious perfumes and the most fetid exhalations; and his sense of feeling was limited to those mechanical functions occasioned by the dread of objects that might be in his way."

After many escapes, he was finally placed under the care of M. Itard, at Paris. It was found that he had all his senses and faculties, but that they were almost incurably dormant. His acquired freedom of will rendered him impatient under instruction. "His paroxysms of rage became more frequent and more violent, but his passion was directed less against persons than things. When in this humour he would gnaw not only his bedclothes but even the mantlepiece; throw the fire-irons, the cinders, and the hot coals, about the room, and conclude the scene by falling into convulsions, with symptoms resembling those of epilepsy." The further history of this poor boy is not stated.

Judging from these three instances, we are assured of the almost irreparable evil of a total want of early education. Here it must be remarked that no child reared in society is uneducated, as speech and a thousand other gifts are acquired from even the most unenlightened parents and neighbours. But in the case of the child reared solitarily in the wild, there is no external power to draw forth the faculties or to confer accomplishments, excepting the necessity of gathering or seizing food and providing for shelter and protection against dangerous animals. A mind thus allowed to remain nearly dormant and savage till the age of maturity, appears, from the cases we know of, to become almost unfit for subsequent culture.

MADRAS.

On the European voyager approaching Madras for the first time, his surprise will be excited by the appearance of several singular objects. The aspect of the town itself from the sea is any thing but attractive, being situated on a flat line of coast; and the glare from its white edifices is particularly unpleasant to the naked eye. The vessel anchors about two miles from the shore, where she is surrounded by what you had regarded an hour or two before as sundry black spots like buoys upon the water, which you were told, perhaps, were human beings, but could hardly believe the statement. These are the *catamaran-men*, probably on a fishing excursion. The catamaran is formed by two or three pieces of wood, tied together at each end, and holding two persons only; upon these the men kneel, and with no other support, trust themselves for miles out on the mighty ocean, or carry letters and communications from the shore to the ship, in weather when it would be perilous for any boats, however strongly made, to do so. These men are, of course, most expert swimmers; and though they not unfrequently get a good souse in the surf as well as the sea, they seldom lose their hold on the frail planks, and still more rarely their lives. The arrival of the catamaran always accompanies, and often precedes, that of the various massulah and accommodation boats, which frequently do not wait till the vessel is anchored, bearing a motley crew, most zealously anxious for the honour of an introduction to the new comers. The massulah boats are made of planks, joined together by rope formed of the fibres of the cocoa-nut. In appearance they very much resemble the half of a walnut-shell, and are capable of holding from twenty to thirty persons, consisting on these occasions partly of *touters* for the various hotels or punch-houses, hawkers of different kinds of wares, and servants seeking situations, the possessors of whom, if their own account of themselves could be believed, would be the most fortunate masters in the world. One and all endeavour to make themselves acceptable to the new arrival by every possible contrivance and manner; some are provided with an army list, others with a newspaper published that very morning, or perhaps an English one brought by the last overland mail; each is ready with a prompt, and, as he hopes, with a gratifying answer, to every question with which he is constantly besieged; all profess an intimate knowledge of any recent casual visiter to Madras. One says that the gentleman put up at his hotel, and was so satisfied with his quarters, that leaving them was his only cause of regret at quitting the presidency; another assures you that *he* was his confidential servant; while a third will quote the gentleman's express declaration that he never dealt with so honest a man!

The most dangerous part of the voyage to Madras is the landing, for the surf is always high, and its tremendous breakers are never still; they roll along with a thundering sound, and no ship's boats can exist for a minute in them. This incessantly boiling surf renders a transit to and from the land always disagreeable, and in some measure dangerous; frequently, indeed, altogether impracticable for days together, without a risk of human life. It would almost seem, from the three or four successive heavy waves, each six feet high, and containing many tons of water, that in its flow from the ocean to the shore, it met with an equal number of acclivities or banks, thereby rendering the waves (in other places so regular, though exposed to almost the same width of ocean) so furious and overwhelming here. A strong current is always flowing according to the wind: if the latter be from the south, of course to the north, and *vice versa*. At some peculiar seasons, the navigation of these currents is more dangerous than at others. Boats are often upset, and the boatmen compelled to leave them and take to the water, or the lives of every one would be sacrificed. In that case the natives, who are capital swimmers, do not make for the shore but when they are obliged: if a heavy surf approaches, they dive until it has passed innocuously over them; whereas were they to continue swimming to land, the mighty force of the coming wave would drive them to the bottom, and by keeping them there for a time, deprive them of all strength for further efforts.

The only description of boat used is the massulah, so contrived as to bear great resistance, by its lightness and pliancy: an English boat, enduring one-half only of the concussions which these hourly suffer unharmed, would infallibly have its bottom or sides stove in. But it is still an extremely critical operation to conduct them through the surf. When they come within its influence, the steersman stands up, and, under great agitation, marks time with his voice and his foot, whilst the rowers work their oars backwards until overtaken by the swell, which, curling up in its approach to the shore, sweeps the boat along with fearful violence. The rowers now ply every oar

forward with their utmost vigour, to prevent the wave from carrying back the boat with its receding swell, and by a few successive surfs the boat is at length dashed high and dry on the shore. Should the boat be capsized, it is ten to one if some of the passengers are not caught by the voracious sharks, which abound ever close to the shore ; and scarcely a month passes without some such accident. The stranger will not be long at Madras without experiencing the ill effects of the surf, very few being so fortunate as to land without a sprinkling. Its evil influence sometimes lasts for many days in succession, thereby causing great inconvenience and expense to merchants and shipowners, by the delay that of necessity arises in landing their cargoes. Such is the dread of it, that residents at Madras have been many years without once crossing it, though the sea beyond offers such inducements for a delightful sail. This difficulty of access, with other disadvantages attending the port, must always make Madras of less commercial importance than would otherwise be the case.

The most striking object on the shore, as seen from the sea, is Fort St George, beyond which is the Black Town, where all business is transacted. In this and the fort are the public offices and shops. The buildings facing the sea at this part are not numerous ; among them we may notice the Supreme Court, the Master Attendant's Office, and the Custom-house. The garden-houses, as they are called, are the chief residences of the officers and civilians. They are neat structures, and the style of architecture is pretty : they are situated in the middle of a garden, closely planted, and the greatest number have only a ground floor ; some that are of a superior description have one storey above. A deep and handsome verandah, or balcony, is supported by pillars in front, and green Venetian windows generally shade the rooms from the glare of the sun. In the interior there are neither window-curtains nor fireplaces, and very seldom a carpet, and only one bed in the middle of each sleeping apartment. You may place your head at which end of the bed you choose, for there is a headboard and pillows at both. Cotton mattresses only are used. The beds are large and high, environed with green gauze curtains, bag-fashion, open at the bottom, and tucked in all around, to keep out the musquitoes ; for let only one of these dreaded insects gain an entrance, and adieu to all rest for the night, however much your frame be exhausted by the heat. The walls of the apartments are *chunamed*. The chunam is a kind of lime, made with oyster and other shells, chalk, and other ingredients. It is prepared thus : ten or twelve women will stand round a quantity of the materials, beating it with large wooden mallets, and keeping time by singing to the motion of their hands. The walls being rubbed with this composition, assume a beautiful white polish, resembling that of the finest marble. The rooms of the more common kind of houses are white-washed or painted, never papered. The rooms are from twenty to thirty feet high, with rough ceilings like English barns, for the beams are uncovered, and sometimes whitewashed, but more frequently left the natural colour of the wood. When there is only one storey to the house, the roofs slope in all the rooms. The floors are of stone or brick, or a composition of lime and gravel ; they are also chunamed over in black and white squares, which gives them a beautiful appearance ; or else they are covered with mats, made of bamboo, which are not very pleasant to walk upon, particularly with the delicate satin shoe of Chinese manufacture, such as is always worn by our countrywomen.

The streets of the Black Town mostly run at right angles, and parallel with each other, though there is sometimes a want of regularity and uniformity. Some of the houses are large brick buildings with flat roofs, but the greater part are built of mud, with tiled roofs. The town is nearly four miles in circuit, and is very populous. Here are the shops of the Europeans and natives, the bazaars, and the residences of the Portuguese and natives. Of the bazaars at Madras, Mrs Major Clemons gives the following graphic description :—"I was very desirous," says she, "on my arrival at Madras, to pay a visit to the bazaars, as I had heard much of them, and had fancied that the bazaars in London were but an humble imitation of those in the East. I ordered my palanquin, and was carried to the bazaar in Triplicane, one of the best and largest near Madras. My ideas of oriental magnificence were much lowered, on finding a long narrow street, scarcely sufficient for a coach to pass down, having on each side mud-houses, so low that you could shake hands with a person on the roof, and displaying, on the dirty benches outside the doors, merchandise of every description ; while about a dozen black people, more than half-naked, of the lowest description, served at each stall, talking all at once in the Malabar language, scolding and wrangling, with naked children lying or playing along the road, and a perfume—not of otto of roses, or millefleurs—but of lamp-oil, garlic, and other nauseous articles. So much for an oriental bazaar, at least at Madras !"

The manners of the Europeans at Madras, the state of society, and style of living, are, for the most part, nearly the same as in other parts of India, except that provisions are more expensive. Within doors, dinner parties, and, during the cold season, monthly assemblies and balls, constitute the routine of amusements. The most fashionable drive at Madras is called the South Beach, answering to the Hyde Park ring of London, and the course and esplanade of Calcutta. It lies to the south of the fort, on the sea-shore, extending to about a quarter of a mile in length. Many of the other drives are interesting, and the roads superb. The Mount Road deserves particular notice ; it is shaded on each side by banyan and yellow tulip trees, of most luxuriant foliage, and there is one continued succession of villas for the six miles to which its length extends. Here it is customary for the fashionable parties in Madras to repair, in their gayest equipages (such as they are), during the cool of the evening, when they drive slowly about the cenotaph, which is here erected to the memory of the Marquis Cornwallis, and converse together. During the hottest part of the day, namely, after two o'clock, which is the time when *tiffin*, or the real dinner, is eaten, many retire to rest until five o'clock, when the master of the family returns from the fort, and an excursion to the Mount Road and dinner then occupy the remainder of the day, unless it be prolonged by a ball and supper in the evening. The morning, from nine to eleven, is the time for visiting, when the European residents call upon each other, retail the news, and offer their services to their friends in the city, to which they must repair on business.

In general, the equipages, whether European or otherwise, are of the most beggarly description ; throughout Madras there is scarcely one really handsome turn-out. The horses, though some of them respectable, yet being chiefly of the Arab breed, and of small stature, show off but poorly in comparison with the English animal. The natives make use of bullocks, and, as beasts of burden, of the buffalo and camel. Their carriages are of all descriptions, from the simple hearse-like palanquin on wheels, to the large padded seat conveyance, with a conical canopy and curtains, upon which two or three persons may repose after the fashion of Hindoos. Palanquins are not numerous, and are more commonly used by natives than by Europeans. It is a pleasant enough conveyance when you become used to it, though at first the motion is disagreeable. It is highly amusing to witness the awkward manner in which a new-comer gets into one for the first time, and the distress apparent on the countenances of many on first hearing the peculiar cry or song of the bearers, which seems like groaning with pain under the burden. These cries are very pitiful, and would tempt a humane stranger rather to get out and walk in the sun, than inflict such apparent misery upon a number of his fellow-creatures. Yet these doleful lamentations are merely customary, and such an exhibition of feeling, should it be perchance shown, would not be appreciated. The lady, to whom we have before been indebted, thus describes this conveyance :—"The palanquin is like a long box, with sliding pannels on each side, and two windows in front ; the seat from the ground is about a foot high, but when elevated on men's shoulders, which is done by a pole extending from each end, you are about three feet from the ground. You recline on cushions, which support your back. For short distances, you have four men at a time to carry you, two at each end, placing the poles on their shoulders, while four men run at the side, ready to relieve them, which they do every two or three minutes. When you travel long journeys, the complement of men required is thirteen, six at each time under the pole, and one to carry the cooking apparatus. Their song, if it may be so called, consists of monotonous sounds, each boy calling a different note, and all keeping exact time with their voices, as well as with their feet. This chant, and the motion of the palanquin, operate as a powerful narcotic, steeping the senses in forgetfulness, the influence of which few can resist. They seldom run more than four miles an hour, and it is astonishing to see how they will keep up at that even pace for twelve hours together, with the exception of halting once for about a quarter of an hour, to eat a little rice. The palanquin-boys* are generally Gentoos, and are the most trustworthy and honest among the natives. An officer of my acquaintance was ordered from Hyderabad to Madras, which is a distance of about four hundred miles, on sick certificate ; he became much worse on the road, and died two days before he could reach that presidency. The palanquin-boys conveyed the body to the office of Colonel Conway, Adjutant-General, and placed in his hands 400 rupees, which they said were in the drawer of the palanquin. Colonel Conway wrote to Hyderabad ; and in answer was informed, by the paymaster of that station, that the poor officer had drawn that sum only the day before he started. Thus were the boys faithful to their trust, when they could have secreted every single rupee, and would not have run any risk of inquiries being made."

There are few beautiful monuments at Madras. Besides the cenotaph to the Marquis Cornwallis, which has been mentioned, there is a statue of the same nobleman in the Fort ; and on the road, between Government House and the Black Town, has recently been erected a splendid equestrian statue, by Chantrey, of the late Sir Thomas Munro, who died while governor of the presidency, deservedly esteemed and universally lamented. In the cathedral, however, is the best monument, also by Chantrey, to Bishop Heber, in the act of confirming two native converts.

Lord Elphinstone, the present governor, is very popular, both with the native and European communities. Government House has no claim to the distinction which has been conferred upon it, as the residence for the chief person at the presidency—some private houses in Madras possessing quite as much accommodation as it affords. The garden, or rather park, attached to the house is very extensive, reaching to the sea-shore, where there is another smaller residence appropriated to the governor, called the Marine Villa.

At Madras the society is more limited than at Calcutta, and there appears in it a degree of apathy as regards personal comforts. In various trifling matters may be perceived a disregard of those luxuries which a denizen of the chief presidency considers as absolute necessaries of life. From the smallness of the place, and the slight increase of its inhabitants during many years, the distinctions of society are also as rigidly preserved as ever ; whereas, in the neighbouring capital, the "schoolmaster has been abroad," and many of those artificial bounds which existed ten years ago, are no longer tenable. Thus, there is still at Madras as wide a gulf separating the privileged classes (consisting of the covenanted services of the East India Company and the mercantile aristocracy) from the tradesmen, as there is in England between the highest peer and the humblest of his *employés*. Many years ago, when the inferior part of the mercantile community consisted of ship-stewards, cuddy-servants, and others, who found their way to India nobody knew how, such distinctions might have been necessary ; but at the present day, when men of education are devoted to similar pursuits, and are at the same time of good birth, and possessing large capital, it is obvious that the line should be greatly relaxed.

The natives of Madras are, in colour, much blacker than their brethren of Bengal, and those of low caste, more particularly, by no means so good-looking ; in other respects they have most of the characteristics of the Bengalese, and are, like them, peaceable, patient, and easily contented. As Europeans do not generally give themselves the trouble to study the language, which is the Malabar, or Telinga, it follows as a necessary consequence that every native, holding any intercourse with them, must have a smattering of English, to which cause must be attributed much of the dishonesty and extortion not seldom to be found in the class in question. As on the continent of Europe, so in India, the path of a prodigal Englishman may be frequently traced by the discontent which results from paying servants or other subordinates properly, in contradistinction to his miscalled liberality. This is an evil to be remedied only by the determination of every one to adhere unflinchingly to those just rules of remuneratory payment which may be readily ascertained, and which, if persevered in, must eventually do away with the annoyances resulting from a contrary practice.

* All men-servants in India are called boys, as in France, *garçons* ; and sometimes when you call "boy," an old grey-bearded man will answer.

POPULAR ENGLISH FESTIVALS.

THE piteous tragedy which completed the scheme of man's redemption has been, from an early age, commemorated throughout Christendom by a series of observances which occur during spring. The crucifixion day itself is remembered in Good Friday, and the resurrection on Easter Sunday, which are not the anniversaries of precise days, but, as now arranged in England at least, depend on the following circumstances :—The first Sunday after the full moon which happens upon or after the 21st of March, is Easter Sunday, unless full moon happen on a Sunday, in which case Easter is the next Sunday after : Good Friday is the Friday immediately before. Upon this arrangement also depends the occurrence of the other holidays of this period. The forty days before Good Friday constitute Lent, the day before the commencement of which is Shrove Tuesday. The Sunday before Good Friday is Palm Sunday ; the day immediately before Good Friday is Maundy Thursday ; and the few days following Easter Sunday are respectively called Easter Monday, Easter Tuesday, &c.

MID LENT SUNDAY.

There were some other days of this holy period attended by unusual ceremonies. The fourth Sunday of Lent, named in England MID LENT SUNDAY, and still a festival of the church, called for all true Christians to pay a visit, if possible, to their "mother church," by which, we presume, was meant the church of their native parish, and there make offerings at the high altar. The epistle for the day (Galat. iv. 21) contained an appropriate allusion, "*Hierosolyma, mater omnium*" (Jerusalem, the mother of all.) And it was the custom on the same day to pay visits to parents, carrying them some little gift, and receiving from them, in return, their blessing and a regale of furmety —that is, a porridge composed of whole grains of wheat boiled in milk, sweetened and spiced. Religious observances never appear in so agreeable a light as when they are thus connected with the domestic affections. The common people spoke of this practice as "going a-mothering," and the day was sometimes called *Mothering Sunday*. Herrick thus speaks of it as a custom in Gloucestershire in his time :—

"I'll to thee a simnel bring,
'Gainst thou goes *a-mothering*,
So that when she blesses thee,
Half that blessing thou'lt give me."

The festival is supposed to have taken its rise in the heathen festival of the Hilaria, celebrated by the ancient Romans, in honour of the mother of the gods, on the ides of March.

CARLING SUNDAY.

The fifth Sunday of Lent was distinguished as CARE or CARLING SUNDAY, terms which appear to be of very dubious import. The peasantry and yeomanry used to steep peas and afterwards parch them, and then, frying them with butter, made a feast of them on the afternoon of this day. It is thought not unlikely that the custom bore some reference to the superstitious notions which the ancients entertained respecting beans, as containing the souls of the departed. The peas, as eaten in the north of England, were called *carlings*, and the mess seems to be identical with that alluded to in a Scottish song of the end of the seventeenth century—

"There'll be all the lads and the lasses,
Set down in the midst of the ha',
With sybows, and reefarts, and *carlings*,
That are baith sodden and raw."

We may presume that the day took its name from this word, *carling* being in time softened into *Care*.* It figures in an old rhyme which enumerates the Sundays of Lent by popular appellations—

"Tid, Mid, and Misera,
Carling, Palm, and good Pace-day."

The three first words are supposed to have been derived from the beginnings of certain psalms—thus, *Te deum*, *Mi deus*, *Miserere* mei.

PALM SUNDAY.

Palm Sunday [which, in the present year, occurs on the 20th of March] is an ancient festival, of a joyful character, designed to commemorate the brilliant though short-lived popularity of the reception which Christ met with on entering Jerusalem, immediately before his passion. On this day, in Catholic countries, the priests bless branches of palm, or some other tree, which are then carried in procession, in memory of those strewed before Christ at his entrance into the holy city. The procession is as splendid as circumstances will admit of; and after it is done, the boughs used are burnt, and their ashes preserved, that they may be laid on the heads of the people next Ash-Wednesday, with the priest's blessing.

In monastic times, the customs of Palm Sunday in England were of an elaborate character; but, as in other countries under a similar latitude, yew, willow, and box, were necessarily substituted for the palm of the Holy Land. The flowers and branches designed to be used by the clergy were laid upon the high altar; those to be used by the laity upon the south step of the altar. The priest, arrayed in a red cope, proceeded to consecrate them by a prayer, beginning, "I conjure thee, thou creature of flowers and branches, in the name of God the Father," &c. This was to displace the devil or his influences, if he or they should chance to be lurking in or about the branches. He then prayed—"We humbly beseech thee that thy truth may [here a sign of the cross] sanctify this creature of flowers and branches, and slips of palms, or boughs of trees, which we offer," &c. The flowers and branches were then fumed with frankincense from censers, after which there were prayers and sprinklings with holy water. The flowers and branches being then distributed, the procession commenced, in which the most conspicuous figures were two priests bearing a *pascal*, in which the crucifix was laid. When the procession had moved through the town, it returned to church, where mass was performed, the communion taken by the priests, and the branches and flowers offered at the altar.†

It appears that it was at one time customary to have a wooden ass ridden by a priest in this procession, in order the more nearly to represent the fashion of Christ's approach to Jerusalem. Another custom of the day was to cast cakes from the steeple of the parish church, the boys scrambling for them below, to the great amusement of the bystanders. Latterly, an angel appears to have been introduced as a figure in the procession: in the accounts of St Andrew Hubbard's parish in London, under 1520, there is an item of eightpence for the hire of an angel to serve on this occasion. Angels, however, could fall in more ways than one, for, in 1537, the hire was only fourpence. Crosses of palm were made and blessed by the priests, and sold to the people as safeguards against disease. In Cornwall, the peasantry carried these crosses to "our lady of Nantswell," where, after a gift to the priest, they were allowed to throw the crosses into the well, when, if they floated, it was argued that the thrower would outlive the year; if they sunk, that he would not. It was a saying that he who had not a palm in his hand on Palm Sunday would have his hand cut off.

After the Reformation, 1536, Henry VIII. declared the carrying of palms on this day to be one of those ceremonies not to be contemned or dropped. The custom was kept up by the clergy till the reign of Edward VI., when it was left to the voluntary observance of the people. Fuller, who wrote in the ensuing age, speaks of it respectfully, as "in memory of the receiving of Christ into Hierusalem a little before his death, and that we may have the same desire to receive him into our hearts." It has continued down to a recent period, if not to the present day, to be customary in many parts of England to go *a-palming* on the Saturday before Palm Sunday; that is, young persons go to the woods for slips of willow, which seems to be the tree chiefly employed in England as a substitute for the palm, on which account it often receives the latter name. They return with slips in their hats or button-holes, or a sprig in their mouths, bearing the branches in their hands. Not many years ago, one stall-woman in Covent-Garden market supplied the article to a few customers, many of whom, perhaps, scarcely knew what it meant.* Slips of the willow, with its velvety buds, are still stuck up in some rural parish churches in England.

MAUNDY THURSDAY.

Maundy Thursday, called also Shere Thursday, is the day before Good Friday. Its name of Shere Thursday appears to have arisen from the practice which the priests made of shearing their hair on this day, to make themselves as trim as possible for Easter. The other name is more doubtful, but seems most probably to have been derived from *maund*, an old English word for a basket, in consequence of the distribution of gifts on this day in baskets—the word *maundy* used by old authors for alms or gifts being apparently derived in its turn from the practice of this day. In an old jest-book, there is a story of a rich merchant dictating a testament to a scrivener, while a poor nephew stood by, hoping to hear of something to his advantage. While the testator was still enumerating the debts due to him, the nephew cried, "Ha, ha! what saith my uncle now?—does he now make his *maundies?*" "No," answered the cool man of business, "he is yet in his *demands*." This is an example of the secondary meaning; of the first, we have instances in Bishop Hall speaking of "a *maund* charged with household merchandise," and Shakspeare saying, "A thousand favours from her *maund* she drew." A maund seems to have been a basket much like our modern hamper.

The religious customs of this day consisted in works of humility and in conferring gifts on the poor. The object seems to have been to commemorate, or imitate, the humility of Christ in washing the feet of his disciples—the giving of maundies being an additional good work. Cardinal Wolsey, at Peterborough Abbey in 1530, "made his maund in our lady's chapel, having fifty-nine poor men whose feet he washed and kissed; and after he had wiped them, he gave every of the said poor men twelve pence in money, three ells of good canvass to make them shirts, a pair of new shoes, a cast of red herrings, and three white herrings; and one of these had two shillings"—the number of the poor men being probably in correspondence with the years of his age. About the same period, the Earl of Northumberland, on Maundy Thursday, gave to each of as many poor men as he was years old, and one over, a gown with a hood, a linen shirt, a platter with meat, an ashen cup filled with wine, and a leathern purse containing as many pennies as he was years old, and one over; besides miscellaneous gifts to be distributed in like manner in name of his lady and his sons. The observance of Maundy Thursday by the monks is described in a Protestant satire called *the Popish Kingdome*:—

"And here the monks their maundies make with sundry solemn rites,
And signs of great humility, and wondrous pleasant sights.
Each one the other's feet doth wash, and wipe them clean and dry,
With hateful mind and secret fraud, that in their hearts doth lie;
As if that Christ with his examples did these things require,
And not to help our brethren here with zeal and free desire;
Each one supplying other's want, in all things that they may,
As he himself a servant made, to serve us every way.
Then straight the loaves do walk, and pots in every place they skink,
Wherewith the holy fathers oft to pleasant damsels drink."

The king of England was formerly accustomed on Maundy Thursday to have brought before him as many poor men as he was years old, whose feet he washed with his own hands, after which his majesty's maunds, consisting of meat, clothes, and money, were distributed amongst them. Queen Elizabeth, when in her thirty-ninth year, performed this ceremony at her palace of Greenwich, on which occasion she was attended by thirty-nine ladies and gentlewomen. Thirty-nine poor persons being assembled, their feet were first washed by the yeomen of the laundry with warm water and sweet herbs, afterwards by the sub-almoner, and finally by the queen herself, kneeling; these various persons, the yeomen, the sub-almoner, and the queen, after washing each foot, marked it with the sign of the cross above the toes, and then kissed it. Clothes, victuals, and money, were then distributed. This strange ceremonial, in which the highest was for a moment brought beneath the lowest, was last performed in its full extent by James II. King William left the washing to his almoner; and such was the arrangement for many years afterwards. "Thursday, April 15 [1731], being Maundy Thursday, there was distributed at the Banqueting House, Whitehall, to forty-eight poor men and forty-eight poor women (the king [George II.]'s age being forty-eight), boiled beef and shoulders of mutton, and small bowls of ale, which is called dinner; after that large wooden platters of fish and loaves, viz. undressed, one large old ling, and one large dried cod; twelve red herrings and twelve white herrings, and four half-quarter loaves. Each person had one platter of this provision; after which were distributed to them shoes, stockings, linen and woollen cloth, and leathern bags, with one penny, twopenny, threepenny, and fourpenny pieces of silver and shillings; to each about four pounds in value. His Grace the Lord Archbishop of York, Lord High Almoner, performed the annual ceremony of washing the feet of a certain number of poor in the Royal Chapel, Whitehall, which was formerly done by the kings themselves, in imitation of our Saviour's pattern of humility."* For a considerable number of years, the washing of the feet has been entirely given up, and since the beginning of the reign of Queen Victoria, an additional sum of money has been given in lieu of provisions.

* In Scotland, when a sheep is killed for private use, it is customary to make cakes with the blood, and these are called *Carcakes*.

CARLETON'S SPORTING SKETCH-BOOK.†

FIELD-SPORTS, we confess, are not much in our way; yet we cannot be insensible to the amusement which they afford in literature. Set down to a book filled with such matters, we find recollections of a country life revived, and, though confined to the heart of a city, once more in imagination we range over field and woodland, saunter rod in hand along the banks of some lively trouting stream, or engage in exercises somewhat more boisterous and mirthful. These floating and fanciful reminiscences have been lately stirred up by perusing Mr Carleton's new work, "The Sporting Sketch-Book," formed by the contributions, as we are told, from the most distinguished sportsmen of the day, both English and American. It is a very pleasing fireside book for a winter's evening, containing some good stories, a number of laughable jokes, and stirring accounts of hunting and fishing excursions—some of them, perhaps, drawn with a bow a *leetel* too long, but still good for all that. Take the following serio-comic scrap as a specimen; the narrator is a gentleman of Kentucky:—

"Gentlemen," observed Ned Locus, in reply to an application, on the following evening, to spin one of his accustomed yarns, "here's the story. It is true, upon my honour, from beginning to end—every word of it. I once crossed over to Faulkner's Island, to fish for *tautangs*, as the north-side people call black fish, on the reefs hard by, in the Long Island Sound. Tim Titus (who died of the dropsy down at Shinnecock Point, last spring) lived there then.

It was during the latter part of July; the sharks and the dogfish had just begun to spoil sport. When Tim told me about the sharks, I resolved to go prepared to entertain these aquatic savages with all becoming attention and regard, if there should chance to be any interloping about our fishing-ground. So we rigged out a set of extra large hooks, and shipped some ropeyarn and steel chain, an axe, a couple of clubs, and an old harpoon, in addition to our ordinary equipments, and off we started. We threw out our anchor at half ebb-tide, and took some thumping large fish; two of them weighed thirteen pounds—so you may judge. The reef where we lay was about half a mile from the island, and perhaps a mile from the Connecticut shore. We floated there, very quietly throwing out and hauling in, until the breaking of my line, with a sudden and severe jerk, informed me that the sea-attorneys were in waiting down stairs, and we accordingly prepared to give them a retainer. A salt pork cloak, upon one of our magnum hooks, forthwith engaged one of the gentlemen in our service. We had business enough of the kind to keep us employed until near low water. By this time the sharks had all cleared out, and the black fish were biting again; the rock began to make its appearance above the water, and in a little while its hard bald head was entirely dry. Tim now proposed to set me out upon the rock, while he rowed ashore to get the jug, which, strange to say, we had left at the house. I assented to this proposition, first, because I began to feel the effects of the sun upon my tongue, and needed something to take, by way of medicine; and, secondly, because the rock was a favourite spot for a rod and reel, and famous for luck: so I took my *traps*, and a box of bait, and jumped upon my new station. Tim made for the island.

Not many men would willingly have been left upon a little barren reef, that was covered by every flow of the tide, in the midst of a waste of waters, at such a distance from the shore, even with an assurance from a companion more to be depended upon than mine, to return immediately, and lie by to take him off. But, somehow or other, the excitement of my sport was so high, and the romance of my situation so delightful, that I thought of nothing else but the prosecution of my fun, and the contemplation of the novelty and beauty of the scene. It was a mild, pleasant afternoon, in harvest time. The sky was clear and pure. The deep blue sound, heaving all around me, was studded with craft of all descriptions and dimensions, from the dipping sail boat to the rolling merchantman, sinking and rising like sea-birds sporting with their white wings in the surge. The grain and grass on the neighbouring farms were gold and green, and gracefully they bent obeisance to a gentle breathing south-wester. Farther off, the high upland and the distant coast gave a dim relief to the prominent features of the landscape, and seemed the rich but dusky

† The Sporting Sketch-Book. Edited by J. W. Carleton, Esq. With fine embellishments. London: How and Parsons. 1842.

frame of a brilliant fairy picture. Then, how still it was!—not a sound could be heard except the occasional rustling of my own motion, and the water beating against the sides, or gurgling in the fissures, of the rock; or except, now and then, the cry of a solitary saucy gull, who would come out of his way in the firmament to see what I was doing without a boat, all alone, in the middle of the sound; and who would hover, and cry, and chatter, and make two or three circling swoops and dashes at me—and then, after having satisfied his curiosity, glide away in search of some other fool to scream at.

I soon became half indolent, and quite indifferent about fishing; so I stretched myself out at full length upon the rock, and gave myself up to the luxury of looking and thinking. The divine exercise soon put me fast asleep. I dreamed away a couple of hours, and longer might have dreamed, but for a tired fish-hawk, who chose to make my head his resting-place, and who waked and started me to my feet.

'Where is Tim Titus?' I muttered to myself, as I strained my eyes over the now darkened water. But none was near me to answer that interesting question, and nothing was to be seen of either Tim or his boat. 'He should have been here long ere this,' thought I; 'and he promised faithfully not to stay long—could he have forgotten? or has he paid too much devotion to the jug?'

I began to feel uneasy, for the tide was rising fast, and soon would cover the top of the rock, and high-water mark was at least a foot above my head. I buttoned up my coat, for either the coming coolness of the evening, or else my growing apprehensions, had set me trembling and chattering most painfully. I braced my nerves, and set my teeth, and tried to hum 'Begone, dull care!' keeping time with my fists upon my thighs. But what music!—what melancholy merriment! I started and shuddered at the doleful sound of my own voice. I am not naturally a coward, but I should like to know the man who would not, in such a situation, be alarmed. It is a cruel death to die, to be merely drowned, and to go through the ordinary commonplaces of suffocation; but to see your death gradually rising to your eyes, to feel the water rising, inch by inch, upon your shivering sides, and to anticipate the certainly coming, choking struggle for your last breath, when, with the gurgling sound of an overflowing brook taking a new direction, the cold brine pours into mouth, ears, and nostrils, usurping the seat and avenues of health and life, and, with gradual flow, stifling—smothering—suffocating! It were better to die a thousand common deaths.

This is one of the instances in which, it must be admitted, salt water is not a pleasant subject of contemplation. However, the rock was not yet covered, and hope, blessed hope, stuck faithfully by me. To beguile, if possible, the weary time, I put on a bait, and threw out for a fish. I was sooner successful than I could have wished to be, for hardly had my line struck the water before my hook was swallowed, and my rod was bent with the dead hard pull of a twelve-foot shark. I let him run about fifty yards, and then reeled up. He appeared not at all alarmed, and I could scarcely feel him bear upon my fine hair line. He followed the pull gently and unresistingly, came up to the rock, laid his nose upon its side, and looked up into my face, not as if utterly unconcerned, but with a sort of quizzical impudence, as though he perfectly understood the precarious nature of my situation. The conduct of my captive renewed and increased my alarm. And well it might, for the tide was now running over a corner of the rock behind me, and a small stream rushed through a cleft or fissure by my side, and formed a puddle at my very feet. I broke my hook out of the monster's mouth, and leaned upon my rod for support.

'Where is Tim Titus?' I cried aloud—'the drunken vagabond! will he never come?'

My ejaculations did no good. No Timothy appeared. It became evident that I must prepare for drowning, or for action. The reef was completely covered, and the water was above the soles of my feet. I was not much of a swimmer, and as to ever reaching the island, I could not even hope for that. However, there was no alternative, and I tried to encourage myself by reflecting that necessity was the mother of invention, and that desperation will sometimes ensure success. Besides, too, I considered and took comfort from the thought that I could wait for Tim so long as I had a foot-hold, and then commit myself to the uncertain strength of my arms and legs for salvation. So I turned my bait-box upside down, and, mounting upon that, endeavoured to comfort my spirits, and to be courageous but submissive to my fate. I thought of death, and what it might bring with it, and I tried to repent of the multiplied iniquities of my almost wasted life; but I found that that was no place for a sinner to settle his accounts. Wretched soul! pray, I could not.

The water had now got above my ankles, when, to my inexpressible joy, I saw a sloop bending down towards me, with the evident intention of picking me up. No man can imagine what were the sensations of gratitude which filled my bosom at that moment.

When she got within a hundred yards of the reef, I sung out to the man at the helm to luff up and lower the boat; but to my amazement I could get no reply, nor notice of my request. I entreated them, for the love of Heaven, to take me off; and I promised I know not what rewards, entirely beyond my power of bestowal. But the wretch of a captain, murmuring something to the effect of 'that he hadn't time to stop;' and giving me the kind and sensible advice to pull off my coat and swim ashore, put the helm hard down, and bore away on the other tack.

It now was time to strip, for my knees felt the cool tide, and the wind dying away, left a heavy swell, that swayed and shook the box upon which I was mounted, so that I had occasionally to stoop, and paddle with my hands against the water, in order to preserve my perpendicular. The setting sun sent his almost horizontal streams of fire across the dark waters, making them gloomy and terrific by the contrast of his amber and purple glories.

Something glided by me in the water, and then made a sudden halt. I looked upon the black mass, and as my eye ran along its dark outline, I saw with horror that it was a shark—the identical monster out of whose mouth I had just broken my hook! He was fishing now for me, and was evidently only waiting for the tide to rise high enough above the rock, to glut at once his hunger and revenge. As the water continued to mount above my knees, he seemed to grow more hungry and familiar. At last he made a desperate dash, and, approaching within an inch of my legs, turned upon his back, and opened his huge jaws for an attack. With desperate strength, I thrust the end of my rod violently at his mouth, and the brass head, ringing against his teeth, threw him back into the deep current, and I lost sight of him entirely. This, however, was but a momentary repulse, for in the next minute he was close behind my back, and pulling at the skirts of my fustian coat, which hung dipping into the water. I leaned forward hastily, and endeavoured to extricate myself from the dangerous grasp; but the monster's teeth were too firmly set, and his immense strength nearly drew me over. So down flew my rod, and off went my jacket, devoted peace-offerings to my voracious visiter.

In an instant, the waves around me were lashed into froth and foam. No sooner was my poor old sporting friend drawn under the surface, than it was fought for by, at least, a dozen enormous combatants! The battle raged upon every side. High black fins rushed now here, now there, and long strong tails scattered sleet and froth, and the brine was thrown up in jets, and eddied, and curled, and fell, and swelled like a whirlpool.

Of no long duration, however, was this fishy tourney. It seemed soon to be discovered that the prize contended for contained nothing edible but cheese and crackers, and no flesh; and as its mutilated fragments rose to the surface, the waves subsided into their former smooth condition. Not till then did I experience the real terrors of my situation. As I looked around me to see what had become of the robbers, I counted one, two, three, yes, up to twelve, successively, of the largest sharks I ever saw, floating in a circle around me, like divergent rays, all mathematically equidistant from the rock, and from each other; each perfectly motionless, and with his gloating, fiery eye fixed full and fierce upon me. Basilisks and rattlesnakes! how the fire of their steady eyes entered into my heart! I was the centre of a circle, whose radii were sharks: I was the unsprung, or rather *unchewed* game, at which a pack of hunting sea-dogs were making a dead point!

There was one old fellow that kept within the circumference of the circle. He seemed to be a sort of captain, or leader of the band, or rather he acted as the coroner for the other twelve of the inquisition, that were summoned to sit on and eat up my body. He glided around and about, and every now and then would stop, and touch his nose against some one of his comrades, and seem to consult, or to give instructions as to the time and mode of operation. Occasionally he would scull himself up towards me, and examine the condition of my flesh, and then glide back, and again rejoin the *troupe*, and flap his tail, and have another confabulation. The old rascal had no doubt been out into the highways and byways, and collected this company of his friends and kin-fish, and invited them to supper.

My sensations began to be now most exquisite indeed; but I will not attempt to describe them. I was neither hot nor cold, frightened nor composed; but I had a combination of all kinds of feelings and emotions. The present, past, future, heaven, earth, my father and mother, a little girl I knew once, and the sharks, were all confusedly mixed up together, and swelled my crazy brain almost to bursting. I cried, and laughed, and spouted, and screamed for Tim Titus. In a fit of most wise madness, I opened my broad-bladed fishing-knife, and waved it around my head with an air of defiance. As the tide continued to rise, my extravagance of madness mounted. At one time, I became persuaded that my tide-waiters were reasonable beings, who might be talked into mercy and humanity, if a person could only hit upon the right text. So I bowed, and gesticulated, and threw out my hands, and talked to them as friends and brothers, members of my family, cousins, uncles, aunts, people waiting to have their bills paid. I scolded them as my servants; I abused them as duns; I implored them as jurymen sitting on the question of my life; I congratulated and flattered them, as my comrades, upon some glorious enterprise. What said I?—what did I not say? Prose and poetry, scripture and drama, romance and ratiocination—out it came.

'My brave associates, partners of my toil'—so ran the strain.

'On which side soever I turn my eyes.'

'Gentlemen of the jury.'

'I come not here to steal away your hearts.'

'You are not wood, you are not stones, but'—

Hah!—'Begin, ye tormentors, your tortures are vain.'

'Good friends, sweet friends, let me not stir you up to any sudden flood.'

'The angry flood that lashed her groaning sides.'

'Ladies and gentlemen.'

'My very noble and approved good masters.'

'Avaunt! and quit my sight; let the earth hide ye!'

'Lie lightly on his head, O earth!'

'O! heaven and earth, that it should come to this!'

'The torrent roared, and we did buffet it with lusty sinews, stemming it aside, and oaring it with hearts of controversy.'

'Romans, countrymen, and lovers, hear me for my cause, and be silent that you may hear.'

'Fellow-citizens, assembled as we are upon this interesting occasion, impressed with the truth and beauty'—

'Isle of beauty, fare-thee-well.'

'The quality of mercy is not strained.'

'Truth is potent, and'—

'Most potent, grave, and reverend seigniors!'

> 'Oh, now you weep, and I perceive you feel
> The dint of pity: these are gracious drops.
> Kind souls, what! weep when you but behold
> Our Cæsar's vesture wounded!'

'Ha! ha! ha!'—and I broke out in a fit of most horrible laughter, as I thought of the mince-meat particles of my lacerated jacket.

In the mean time, the water had got well up towards my shoulders; and while I was shaking and vibrating upon my uncertain foot-hold, I felt the cold nose of the captain of the band snubbing against my side. Desperately, and without a definite object, I struck my knife at one of his eyes, and, by some singular fortune, cut it out clean from the socket. The shark darted back, and halted. In an instant, hope and reason came to my relief, and it occurred to me that, if I could only blind the monster, I might yet escape. Accordingly, I stood ready for the next attack. The loss of an eye did not seem to affect him much, for, after shaking his head once or twice, he came up to me again, and when he was about half an inch off, turned upon his back. This was the critical moment. With a most unaccountable presence of mind, I laid hold of his nose with my left hand, and with my right I scooped out his remaining organ of vision. He opened his big mouth, and champed his long teeth at me in despair; but it was all over with him. I raised my right foot, and gave him a hard shove, and he glided off into deep water, and went to the bottom.

Well, gentlemen, I suppose you'll think it a hard story, but it is none the less a fact, that I served every remaining one of those nineteen sharks in the same fashion. They all came up to me, one by one, regularly and in order, and I scooped their eyes out, and gave them a shove, and they went off into deep water, just like so many lambs. By the time I had scooped out and blinded a couple of dozen of them, they began to seem so scarce that I thought I would swim for the island, and fight the rest for fun on the way; but just then Tim Titus hove in sight, and it had got to be almost dark, and I concluded to get aboard and rest myself."

LETTER FROM A CANADIAN EMIGRANT.

A LETTER from a gentleman resident in Upper Canada, near the small town of Paris, written to a friend in Edinburgh, having been put into our hands for the purpose of extracting any matter from it that appeared useful to intending emigrants, we take the liberty of laying the following passages before our readers. The recommendations as to emigration are clearly referable only to hard-working men, accustomed to country labour, and who are steady in behaviour:—

"With reference to the Paisley Emigration Society, I shall be happy to be of any service to the poor people; but, to give sound advice, one would require to know more of them than I do, and to have a more extensive knowledge of the country than I am possessed of. Their idea of getting land from government, and one half working on it and the other going out, is not a bad one, *provided* they can *get* the land, and it be of good quality, and not too far back, and they have some *capital* to begin with. Free grants of land are, however, not now to be had. It was indeed determined to let such people as the society in question is composed of, have grants of fifty acres each, in one section of the country; but this resolution was disallowed by the home government, excepting to the extent of five acres each. I rather suspect, therefore, that that part of the Emigration Society's scheme cannot be realised.

I have mentioned the case to two or three of my friends, and their idea coincides with my own, which is, that although it will not be easy to carry the proposed plan into effect at present, there is nevertheless every encouragement for sober, industrious, active, able-bodied people to come to the country. It is just the country for such people. The public works will employ a great many hands next year. Indeed, there are now advertisements out for 500 men to enlarge the Welland Canal feeder. It is probably at such works the Paisley people would find employment at first; and I presume that they would get about 3s. 9d. currency a-day without board, or 2s. 6d.

with board, which are the common wages we have to pay for day-labourers. Good female servants are much wanted. Girls who are strong enough to wash, get 4 dollars to 4½ dollars per month; and some few *very* good ones, who have *very* heavy work, get as high as six dollars. Younger girls get in proportion to the work they can do. Agricultural labourers get on an average 10 dollars a-month all the year round. Hiring by the month in summer, for two or three months, they obtain from 11 to 13 dollars, according to circumstances and the season. Hay-makers generally get 3s. 9d. a-day, and harvest hands 1 dollar a-day, both with board. In my opinion, the best time for people, especially agricultural labourers, to come into the country, is about the end of June, when plenty of work is to be had at haying, and afterwards at harvest; and good hands generally find permanent work on some of the farms where they have been assisting. But your people, I fear, have no knowledge of agricultural labour. The advice I would be inclined to give them is, as soon as they land, to endeavour to make their way up the country, where hands will be less plenty than at the ports of landing; and to take individually such work as they are suited to, as they can get it, and not to think of all working together, for I deem that to be impracticable for any length of time. The girls, if there are any, and the boys, should be put out as opportunity is found, so as to make every thing pay. The probability is, that one family will settle here and another there. People with capital can choose their location; but those without must let circumstances point out theirs. I am desirous the people should not entertain wrong notions of their prospects; yet, as I said before, I am of opinion they ought to come out if they can. If able to work, they will be decidedly better off here than at home. I don't know an instance of a sober, industrious labouring man, who has not bettered himself, and is not gradually improving in his circumstances. You may easily see how this must be, by comparing wages with prices of provisions. I have told you the wages. I will give you the Toronto prices of the principal articles, which may be considered rather higher than the country prices; and I will give you the highest quotation. Household flour, 25s. per 196 lbs.; oatmeal, the same; beef, 20s. per 100 lbs., or about 2d. sterling per lb.; mutton and veal, 3½d. to 4d. currency per lb.; pork, there is no quotation, but it may be had for about 4 dollars per 100 lbs.; butter, 10d. per lb.; it is 7½d. in Paris; cheese, 3d. to 5d. This last article is rather cheaper in Toronto than in the country. Potatoes, 1s. 3d. per bushel. I should presume that a house, such as a labouring man would want, may be had for two dollars per month at the utmost; and a managing handy fellow (and all must be handy here to do any good) may very soon sit at no rent at all, by building himself a small house with boards, as many do. There are three or four about Paris now, which I am sure did not cost more than £5 a-piece, exclusive of the labour of putting together. They are placed on patches of waste ground, with leave of the proprietor. I never wear *shoes* now: few do—they are not fit for winter. My boots, where they are fine, cost me about the same price currency which I paid in sterling, which is therefore about a fifth less. Strong coarse boots can be had for from 3½ to 4½ dollars. Clothes are dearer than at home, but not much.

I have taken it for granted that the men cannot get grants of land; but any doubt on that head may be set at rest by applying at the Colonial Office, which can easily be done through some of the gentlemen whose names are at the prospectus. As to getting land by purchase, probably most of those who are very much inclined to do so may acquire it in time. I know several instances of men (they have been single men), after being in the country for five or six years, going on their own 100 acres of land, with a few acres cleared, which they had paid for out of their earnings. But then they are all steady, industrious, and saving. I had a man with me for eighteen months, who had been in the country five or six years. He had his deed for 100 acres when he came to me; and when he left me, he had paid for clearing ten or fifteen acres, and went on his own farm then with two barrels of pork, four barrels of flour, a yoke of oxen (I am not sure but in this his cousin and neighbour had a half share), and £20 in money. John Harper, the last man Adam had, went off to his own farm to-day. He has scraped a good deal of money together; perhaps £150 or £200. I also saw a man to-day who has now a farm with sixty acres cleared. He was with Walter a year or two. He is quite a young man—a canny, cautious Scot. All these are or were common labouring men, and they are instances which have occurred among the labourers on three adjoining farms, and are only a sample of what *may* be done by industry and frugality. I mention these instances to encourage the people; but they must expect to encounter difficulties. Some will be more fortunate than others; but all may lay their account to meet with difficulties and hardships of some kind, especially when they first arrive in the country."

GOTHIC PATTERNS.

The practice of making articles after the style of Gothic architecture, has been smartly ridiculed, as follows, in the lectures of Mr Pugin, lately published in the Civil Engineer and Architects' Journal:—"Modern grates are not unfrequently made to represent diminutive fronts of castellated or ecclesiastical buildings, with turrets, loopholes, windows, and doorways, all in a space of forty inches. The fender is a sort of embattled parapet, with a lodge-gate at each end; the end of the poker is a sharp-pointed finial; and at the summit of the tongs is a saint. It is impossible to enumerate half the absurdities of modern metal-workers; but all these proceed from the false notion of disguising instead of beautifying articles of utility. How many objects of ordinary use are rendered monstrous and ridiculous, simply because the artist, instead of seeking the most convenient form, and then decorating it, has embodied some extravagance to conceal the real purpose for which the article has been made! If a clock is required, it is not unusual to cast a Roman warrior in a flying chariot, round one of the wheels of which, on close inspection, the hours may be descried; or the whole front of a cathedral church, reduced to a few inches in height, with the clock-face occupying the position of a magnificent rose window. Surely the inventor of this patent clock-case could never have reflected, that, according to the scale on which the edifice was reduced, his clock would be about two hundred feet in circumference, and that such a monster of a dial would crush the proportions of almost any building that could be raised. But this is nothing when compared to what we see continually produced from those inexhaustible mines of bad taste, Birmingham and Sheffield—staircase turrets for inkstands, monumental crosses for light-shades, gable ends hung on handles for door-porters (?), and four doorways and a cluster of pillars to support a French lamp; while a pair of pinnacles supporting an arch is called a Gothic-pattern scraper, and a wiry compound of quatrefoils and fan tracery an abbey garden-seat. Neither relative scale, form, purpose, nor unity of style, is ever considered by those who design these abominations: if they only introduce a quatrefoil or an acute arch, be the outline and style of the article ever so modern and debased, it is at once denominated and sold as Gothic. While I am on this topic, it may not be amiss to mention some other absurdities which may not be out of place, although they do not belong to metal-work. I will commence with what are termed Gothic-pattern papers, for hanging walls, where a wretched caricature of a pointed building is repeated from the skirting to the cornice in glorious confusion—door over pinnacle, and pinnacle over door. This is a great favourite with hotel and tavern keepers. Again, those papers which are shaded are defective in principle; for, as a paper is hung round a room, the ornament must frequently be shadowed on the light side. The variety of these miserable patterns is quite surprising: and as the expense of cutting a block for a bad figure is equal if not greater than for a good one, there is not the shadow of an excuse for their continual reproduction. A moment's reflection must show the extreme absurdity of repeating a perspective over a large surface, with some hundred different points of sight: a panel or wall may be enriched and decorated at pleasure, but it should always be treated in a consistent manner."

THE RIVAL BUBBLES.

[The danger of unduly exciting sentiments of emulation in children—as, for instance, causing them to struggle to outmatch their fellows at school, and the evil consequences engendered by it between friends and companions—is finely illustrated in the following poetic fable by the author of "Fireside Education:"—]

Two bubbles on a mountain stream
Began their race one shining morn,
And, lighted by the ruddy beam,
Went dancing down 'mid shrub and thorn.

The stream was narrow, wild, and lone,
But gaily dash'd o'er mound and rock,
And brighter still the bubbles shone,
As if they loved the whirling shock.

Each leaf, and flower, and sunny ray,
Was pictured on them as they flew,
And o'er their bosoms seem'd to play
In lovelier forms and colours new.

Thus on they went, and side by side
They kept in sad and sunny weather,
And rough or smooth the flowing tide,
They brightest shone when close together.

Nor did they deem that they could sever,
That clouds could rise or morning wane;
They loved, and thought that love for ever
Would bind them in its gentle chain.

But soon the mountain slope was o'er,
And 'mid new scenes the waters flow'd,
And the two bubbles now no more
With their first morning beauty glow'd.

They parted, and the sunny ray
That from each other's love they borrow'd,
That made their dancing bosoms gay,
While other bubbles round them sorrow'd;

That ray was dimm'd, and on the wind
A shadow came, as if from heaven,
Yet on they flew, and sought to find
From strife the bliss that love had given.

They parted, yet in sight they kept,
And rivals now the friends became,
And if perchance the eddies swept
Them close, they flash'd with flame;

And fiercer forward seem'd to bound
With the swift ripples toward the main;
And all the lesser bubbles round
Each sought to gather in its train.

They strove, and in that eager strife
Their morning friendship was forgot,
And all the joys that sweeten life,
The rival bubbles knew them not:

The leaves, the flowers, the grassy shore,
Were all neglected in the chase,
And on their bosoms now no more
These forms of beauty found a place.

But all was dim and drear within,
And envy dwelt where love was known,
And images of fear and sin
Were traced where truth and pleasure shone.

The clouds grew dark, the tide swell'd high,
And gloom was o'er the waters flung,
But, riding on the billows, nigh
Each other now the bubbles swung;

Closer and closer still they rush'd
In anger o'er the rolling river;
Then met, and, 'mid the waters crush'd,
The rival bubbles burst for ever!

MANUFACTURING OLD PICTURES.

Persons possessing more money than judgment, and affecting a taste in *ancient* paintings, cannot be made sufficiently aware of the tricks performed in the preparation of articles to suit their fancy. Indeed, the smallest reflection should convince any one that Correggio, Rembrandt, Rubens, Claude Lorraine, Guido, &c., could not have produced all the pictures ascribed to them, if they had respectively painted by steam during the whole of their lives. A writer in the *New Monthly Magazine*, last year, very properly exposes this process of old picture-making to suit English amateurs. He observes:—"The extent to which copies are made of paintings by esteemed artists is incalculable; and so cleverly do the copyists often imitate the originals, as occasionally to deceive even the best judges. This is so well known, that it is now almost as necessary to have the pedigree of a valuable painting, when purchased, as to have that of a valuable horse. It is rare for an amateur now-a-days to buy of a stranger a high-priced painting on his own judgment, without being imposed upon. We could enumerate many instances of noblemen and gentlemen when abroad paying extravagant sums for copies worth but a few pounds; but one instance will suffice:—A nobleman, enjoying considerable reputation as a connoisseur and patron of art, whilst travelling in the Netherlands, was strongly recommended to purchase a fine painting by Rubens; and so well contrived a story was told of its history, that his lordship gladly gave eight hundred pounds for it, afterwards congratulating himself on having made so advantageous a bargain. On arriving in London, wishing his purchase to be placed in his gallery with every advantage, he sent it to be lined, when, on uncovering the back of the picture, the name of 'Robertson and Miller,' the canvass preparers, appeared on the canvass, plainly proving that it was a modern copy, executed most probably by an English artist! Very few of the old masters have been so frequently repeated as Rubens, and many collectors who pride themselves on having a genuine work from his hand, possess only a clever copy. The late Admiral Sir Ross Donnelly was exceedingly enthusiastic on what he considered some matchless productions of the great Flemish painter, which held a conspicuous situation in his gallery. A few weeks ago the whole collection was disposed of by auction at Messrs Christie and Manson's rooms, and realised about £800; whereas a single fine Rubens (such, for instance, as the Rape of the Sabines in the National Gallery) is of itself alone worth three times that sum.

Examples of the different Italian schools are, however, the most extensively copied. The pupils and foreign artists of every country copy almost every fine picture they can get access to in Italy; and among the most industrious of these manufacturers are English artists, who have gone to Italy with the ostensible object of improving themselves by a careful study of the best productions of the Italian school. In due time these copies come into the market, and, when sufficiently dirty, often pass for genuine pictures. Of course, the principal dealers in London are too experienced to be deceived by them, and are too careful of their reputations to attempt to deceive their customers; but few private buyers possess such judgment. Still it must in justice be stated, that the art of deception is carried on in this way in Italy to an extent which leaves similar impositions in England very far in the rear.

Instances have been known of English connoisseurs, in their anxiety to secure a genuine picture, paying an enormous sum to the head of a religious community, whose chief treasure it has been considered; and, to make assurance doubly sure, they have, at his reverence's instigation, affixed their seals at the back of the picture. On its coming into their possession, they find the seal untouched, and take no small credit to themselves for having secured to their country another invaluable Raphael or Correggio. The fact is, that an admirably executed copy was fitted with great nicety into the back of the original picture, and on *this* the reverend father got his generous customer carefully to affix his seal. The original picture in front was then removed, and the connoisseur carries the copy into his own country for a genuine production."

POPULARITY.

Works of true merit are seldom very popular in their own day; for knowledge is on the march, and men of genius are the *præstolatores* or *videttes* that are far in advance of their comrades. They are not with them, but before them; not in the camp, but beyond it. The works of sciolists and dullards are still more unpopular, but from a different cause; and theirs is an unpopularity that will remain, because they are not before the main body but behind it; and as it proceeds, every moment increases the distance of those sluggards that are sleeping in the rear, but diminishes the distance of those heroes that have taken post in the van. Who then stands the best chance of that paltry prize—contemporaneous approbation? He whose mediocrity of progress distances not his comrades, and whose equality of merit affords a level on which friendship may be built; who is not so dull but that he has something to teach, and not so wise as to have nothing to learn; who is not so far before his companions as to be unperceived, nor so far behind them as to be unregarded.—*Lacon.*

A FEW WEEKS ON THE CONTINENT.

LUCERNE.

My last article concluded with our arrival in Lucerne. The approach to that very ancient town from Zug was through a remarkably rich tract of country, chiefly composing the vale of the Reuss, a river formed by the overplus waters of the Lake of Lucerne and country beyond, but increased by a tributary from the smaller Lake of Zug. Pursuing a south-westerly direction, our route lay along the right bank of the Reuss, which, rushing onward sometimes beneath high woody banks, on the face of which our road was cut, and at others crossing flat and well-cultivated plains, imparted liveliness to the scene.

Things now began to wear a more decidedly Swiss appearance. There was more of the air of past times than of the present. The farm-houses and cottages, all built of wood, though not possessing an inviting aspect, were, with their strange overhanging roofs and balconies, at least picturesque; and at every short interval we passed a small chapel, whose ever-open doors offered a glimpse of flower-decorated altars, with occasionally a peasant in the attitude of devotion. As evening began to fall and shut out an extended observation of the country, we entered Lucerne by one of its heavy arched portals, the town still being environed with walls and towers on the side next the land, and open on the other, with a southern exposure to the lake.

We found Lucerne to be quite a different sort of place from Zurich. It may not inappropriately be styled the Cologne of Switzerland—narrow streets, huddled into a confined space for defence in an age of civil disorder—gloomy edifices, like so many prisons—small shops, some of which more resembled caverns than places of business—little appearance of active industry—a great many churches—and plenty of priests, distinguishable by their long black frocks and cocked hats. Except in and about the hotels, which flourish the same in all countries, and here give an air of life to the open quay on the margin of the lake, the place, I should think, is very much what it was some four or five centuries ago. The town, which contains about 8000 inhabitants, is in two divisions, one on each side of the Reuss as it issues from the lake; but as the division on the east is intruded upon by a bay of the lake, requiring to be crossed by a bridge, there may be said to be three portions more or less separated from each other. One of the most remarkable objects of antiquity which the stranger is called on to notice, is a tall grey tower, which stands within the margin of the lake, called the Wasserthurm, the origin of which is assigned by tradition to the Romans. In after ages it became the *pharo*, or light beacon, of the lake; hence, as is said, the name *Lucerne* (Latin, *lucerna*, a lantern). It is now used as a cantonal repository of some kind.

The manner in which the town is cut up into detachments has caused the erection of several bridges, and these are among the most interesting edifices in Switzerland. I should make the reader aware, that the bridges across rivers in this country are for the greater part composed of strong wooden beams, with a flooring of thick planks, and the whole covered in, like a house, with a roof, generally of tiles or shingles. In going along such bridges, which are so constructed to preserve them from the weather, you seem as if walking in a long covered gallery, open at the sides, and with great rafters overhead. In the Roman Catholic cantons, it is customary to place a figure of the Virgin, or patron saint, somewhere within the gallery, in order to excite the piety of the passengers. At Lucerne, this practice of adorning bridges is on a large scale. Of the four bridges in the town, three are covered and highly decorated with pictures, chiefly of a religious character. The longest and most ancient bridge is that called the Hofbrücke, leading from the open quay across the bay of the lake to the cathedral of St Leger, on the opposite bank. Extending upwards of 1000 feet in length, and open on the side next the larger portion of the lake, the triangular spaces overhead, formed by the two slopes of the roof and the cross rafters, are filled from one end to the other with paintings, illustrative of Scripture, from the days of Adam upwards. As works of art they do not deserve to be mentioned; but their great age is beyond doubt, and on that account they will attract the curiosity of the antiquary. The splendid view of the lake and its mountainous scenery, gained from any part of the bridge, renders the promenade doubly attractive, and during our stay it formed a favourite lounge. The next bridge of a similar nature is that on the Reuss near its junction with the lake, and called the Kapellbrücke, from its contiguity to a chapel. This bridge, which is much more modern than the former, dating only from the year 1300, contains a double series of paintings. In going one way, we have a series representing the legends of two patrons of the town, St Maurice and St Leger; and in the other, the pictures are illustrative of memorable events in Swiss history. An account of this remarkable gallery of tableaux has been written by the Canon Basinger. A bridge opposite the middle of the town is uncovered; but one farther down, called Mühlenbrücke, or mill-bridge, is covered like the others, and is fitted up with a still more interesting series of sixty-six pictures, representing the Dance of Death, the greater part executed by Meglinger, an artist of ability. As all the bridges are public thoroughfares, and open night and day for passengers, it says much for the decorum and good taste of the people, that these galleries of paintings, common as they are, should be suffered to exist uninjured.

The public buildings of Lucerne, including the ecclesiastical structures, of course engaged a share of our attention; but as accounts of such places are not always amusing to readers, I pass on to an object somewhat more attractive, and which, without any figure of speech, is now the great *lion* of the town. I allude to the celebrated monument to the memory of the Swiss Guards, who fell in defence of the family of Louis XVI. at the attack on the Tuileries, on the 10th of August 1792. It is situated a little beyond the gate of the town which we had entered from Zug, and is reached by a side path ascending among trees and bushes. Ushered upon a flat part of the rising ground, environed by the massive foliage of trees, we have before us a precipitous cliff crowned with drooping herbage, and with a small pond which receives the trickling moisture at its base. In the centre of the rock the monument is cut, and we are startled alike by the novelty and the grandeur of the conception. It is the gigantic figure of a lion couched and dying, from a mortal wound by a spear in the side, yet leaning over and guarding in the death struggle shields on which are blazoned the fleur-de-lis or emblem of the Bourbons. The rock, which is a species of sandstone, appears to have been well adapted for the execution of the figure, which is of the enormous size of 28 feet long by 18 feet in depth, but seems less from the height at which it is placed. It does not project from the general surface of the cliff, but rests in an alcove, as a protection from the weather overhead. The designer was the celebrated Danish sculptor Thorwaldsen, the cutting being performed by Ahorn of Constance. As a work of art, the monument is of the highest order of genius, for the idea is not only beautifully conceived, and perfectly true as respects association of ideas, but is, as far as I know, original—a matter of no small importance, considering how moderately the inventive faculty is developed in monumental designing. Fastidious critics find fault with the principle of the design altogether, and particularly with the truthfulness of the superscription, carved on the rock, *Helvetiorum Fidei ac Virtuti*—(To the fidelity and valour of the Swiss)—it being alleged that, in the character of mercenary soldiers, the Swiss could claim no such tribute of respect from their countrymen or from posterity. Alas! for the principle of unpurchased and patriotic soldiering. Is there a man in the standing army of any nation under heaven who serves for any thing but the hope of pay, rank, or pension, or cares a rush about the merits of any quarrel which he is dispatched to settle by force of arms? Selling their services on a principle so widely recognised, we cannot for a moment doubt the stern virtue of the Swiss. The manner in which they defended the royal family of France from the brutality of the Parisian mob, the greater number perishing rather than yield up their posts, I consider to be one of the very finest things in history, and well deserving of the commemorative tribute which it has here received.

On the opposite side of the enclosure there is a rustic saloon in which prints of the monument and other articles of taste are disposed of, and here is generally in attendance one of the few guards who survived the massacre. He is an aged man, dressed in a red uniform, and we had a little conversation with him on the subject before us, with which, of course, he has a pride in identifying himself.

But we must tear ourselves away from the lion of Thorwaldsen, with all its associations of feeling, and be off on our excursion on the lake, which has no equal for beauty and grandeur of scenery in Switzerland, if, indeed, in any part of Europe. What a magnificent spectacle presents itself in a fine autumnal morning from the quay of Lucerne! A sheet of water is seen spread out a length of ten or twelve miles, till lost in the sinuosities of the jutting hills. On each side is a foreground of highly wooded banks, dotted here and there with white villas and cottages, while behind rises pile above pile of rugged mountains, some dark and precipitous like huge walls of rock elevated to the clouds, but others of greater altitude, and, as it seems, more remote from the eye, covered with snows of dazzling whiteness. The two grand chiefs in this tumultuous ocean of mountain billows is the Righi on the left, and Pilatus on the right—the latter one of the most remarkable hills in Switzerland, though not half the height of some others which I shall afterwards mention. Its summit, which is somewhat saddle-shaped, with turned up points, is estimated to be about 5760 feet above the level of the lake, or 7116 feet above the level of the sea. Its ascent is difficult and seldom attempted. The Righi, on the other hand, whose culminating point attains a height of about 3870 feet above the lake, is ascended with comparative ease, and offers at its summit a panoramic view of surprising extent and variety.

A few years ago, to accommodate the numerous tourists, a steam-boat was placed on the lake, to ply between Lucerne and Fluelen at its farther extremity, a total distance of twenty-five miles, going and coming daily; and in this handsome little vessel we set out on our trip, accompanied by a number of other parties, likewise in the pursuit of pleasure.

The day was clear and serene, and as we sped along on our way, every hill and alpine peak was revealed to the curious eyes which gazed delightedly from the deck. Sketch-books and pencils were out, and nimble fingers tried to catch the outline of romantic cliff, jagged peak, or bosky dell with thread of cataract dashing into its depth profound. Ever shifting, however, and always bringing into sight new beauties, the scene was bewildering, and the draughtsman would have required a hundred eyes, and a hand more rapid than the steam piston, to do justice to the spectacle.

I know that all regular description of such a lake as this is inexpressibly tiresome, and I therefore skip over the notice of fifty places of local import, and take only what may be termed the main points of interest in the piece. The thing which imparts to the Lake of Lucerne a character beyond that of mere physical beauty, is its connexion with the history of Helvetic independence. It is Tell's lake—its shores are the scene of his exploits—and hence they bear that kind of moral charm which consecrates the ground on which heroic actions have been evoked.* In the true spirit of a poet, Rogers has referred to the sentiment which thus clothes the rugged headlands and steeps of Lucerne with hallowed recollections :—

> "That sacred lake, withdrawn among the hills,
> Its depth of waters flank'd as with a wall,
> Built by the giant race before the flood;
> Where not a cross or chapel but inspires
> Holy delight, lifting our thoughts to God
> From god-like men. * * *
> That in the desert sow'd the seeds of life,
> Training a band of small republics there,
> Which still exist, the envy of the world!
> Who would not land in each, and tread the ground—
> Land where TELL leap'd ashore—and climb to drink
> Of the three hallow'd fountains? He that does,
> Comes back the better. * * *
> Each cliff, and headland, and green promontory,
> Graven with records of the past,
> Excites to hero-worship."

The lake, which is most irregular in its outline, bending into divers forms, is sometimes named the Lake of the Four Cantons, from having Lucerne, Unterwalden, Uri, and Schwytz, as its boundaries. On the south or Unterwalden side, the scenery is generally more bold, and on the whole less interesting than the north-eastern shore, to which the boat chiefly clings. On this latter side, after passing some pretty bays, and touching at the villages of Wäggis and Küssnacht, whence the Righi may be ascended, we arrive at a rocky promontory, having a similar headland on the opposite side, the two (locally called the Nasen or Noses) approaching, and forming a narrow channel, beyond which the lake expands in a sweep towards the north-east, and discloses some highly interesting mountain scenery. On our left we have that portion of the canton of Schwytz which, prior to 1798, formed the independent canton of Gersau—a district so small as to lie all on the face of a steep hill, and which, flanked with precipices projecting into the lake, was almost inaccessible to an aggressive force except by water. On coming in front of the small collection of cottages, with their church, which constituted the capital of the state, the steamer paused for a few minutes to land a passenger, and afforded us an opportunity of taking a view of the ancient republic. Placed in a situation the most unpropitious for general industry, even here the unconquerable diligence of the Swiss is exercised; the article silk giving, I am told, employment to a number of hands in the place. But agriculture and pasturage engage the chief attention of the inhabitants. The green hill is partitioned in small patches, under different crops; and we see cottage above cottage perched on the dizzy steep, to a height of perhaps two thousand feet. Shortly after passing Gersau, we arrive at Brunnen, a small port to the town of Schwytz, which is observed at some distance, under the lee of a tremendous range of bare peaks called the Mythen. Pencils and sketch-books in great request!

Departing from Brunnen, we find that the lake now bends towards the south, while its scenery assumes a more rugged and solemn character. The beautiful sheet of water, extending miles in front, seems to resemble a pool at the bottom of a great grave, without visible outlet. Its lofty sides, shagged with green shrubs, rise from the brink nearly as precipitous as a wall. Any thing like a road is entirely out of the question; the only means of access from knoll to knoll being by boats or precarious pathways among the cliffs; yet here, also, rude cottages are seen seated on shoulders of the mountain steeps. It is here that the moral interest of the scene rises to its climax, for we are now at the very birth-place of Swiss independence. On our right, on an elevated green slope, surrounded by trees and backed by the tall rocks, is Grütli, a meadow on which took place, on the night of the 7th of November 1307, the first meeting of confederates to achieve the liberty of their country. At that period, as is doubtless well known, a large portion of the country was held in subjection by Albert of Hapsburg, a grasping tyrant, who succeeded his father Rudolph as Emperor of Germany. Gessler, the governor whom he appointed, with a body of Austrian forces to secure his sovereignty, having outraged every principle of justice and humanity, stung the natives into rebellion; and it was at the secluded spot which I mention that the conspirators held their first council, and determined on the measures which they should adopt. They were thirty-three in number, with three leaders—Walter Furst of Uri (father-in-law of Tell), Werner Stauffacher of Schwytz, and Arnold von Melchthal of Unterwalden. All swore a solemn oath to maintain their ancient independence; and the effort was nobly made. A rising of the four forest cantons took place on the 1st of January 1308; the Austrian governors were deposed, and the castles which had been built to overawe the country were destroyed. From this time ensued one of the most extraordinary struggles for political independence which is disclosed in European history. It lasted for a hundred and fifty years, sometimes with one foe and sometimes with another; the three great victories of Morgarten, Sempach, and Murten (or Morat), were, however, gained; and about the year 1450, a number of the cantons established that confederated independence which till the present day exists.

Sailing on a few miles, we arrive in front of what is called Tell's Chapel, situated on the east side of the lake, at the foot of the Achsenberg, a mountain rising to the height of 6732 feet, to which we may add a depth of 600 feet below the surface of the water. The chapel, which is a very small edifice, of a pavilion form, open in front, and distinguished by a small spire on its roof, is erected on a shelf of rock jutting out from the almost precipitous bank, and close upon the edge of the lake. The only means of access is by boats. Here, according to tradition, Tell leaped ashore, and escaped from the boat in which he was in the course of being conveyed to the dungeons of Küssnacht; his fetters having been temporarily removed to allow of his navigating the boat, and so saving it from being overwhelmed by a tempest, which had overtaken it in the passage. The chapel, we are told, was erected in 1380, or thirty-one years after the death of the hero, by order of the assembled citizens of Uri, in commemoration of the event. The chapel is fitted up with an altar, and its walls ornamented with a few daubs of pictures; its general appearance is wild and desolate, and only once a-year, on a particular festival, is any religious service performed within it.

Bending round a promontory, on quitting the chapel, we have the termination of the lake in view, and are soon landed at Fluelen, the port of the canton of Uri. Here we find carriages in abundance, ready to start for Altdorf, the capital of Uri, situated from two to three miles up the vale of the Reuss, and also to carry forward tourists on their way to Italy by the pass of the Gotthard. Altdorf is a poor-looking, ancient town, without any particular object of attraction, but is visited from its connexion with the history of Tell's exploits, it being in an open space in the town that he is said to have shot at the apple on his son's head. The vale of the Reuss, from this aged city downwards to Fluelen, is flat meadow-land, with cottages of a more wretched appearance than had hitherto come under our observation. Composed, for the greater part, of wood, few of them seemed to have chimneys, and the smoke issued from the doors or from the loose deals on the roof, which were held in their places only by rows of stones. The external details no way compensated for this rude state of affairs; and the inhabitants were apparently at the lowest pitch of human degradation. Betwixt Fluelen and Altdorf, I saw at least a dozen cretins—a class of beings altogether or partially idiotic—their melancholy condition being sometimes aggravated by a singular swelling on the throat, known by the name of goitre. Idiocy has here, as is generally known, an excessive character peculiar to the place, possibly arising from atmospheric causes. I could imagine no peculiarity more dismal. It is inexcusable, however, to allow the cretins to be so much exposed to public view. Policy as well as good taste loudly calls for the seclusion of all such objects.

From all I could learn from persons conversant with the condition of the country around the lake, it appears that the people, with all their political independence, are socially and intellectually in a kind of pupilage. The four cantons may be described as the focus of an intense spirit of ecclesiastical domination, under which no intelligence can flourish. The progress towards enlightenment which began to be manifested in Lucerne, shortly after 1830, is stopped; and although the whole education is not yet legally in the hands of the holy fathers, it is substantially overruled by them. It may perhaps surprise our readers to learn, that in the cantons of Schwytz, Uri, Unterwalden, and Lucerne, the very cradle of political liberty, religious liberty is on so meagre a footing at the present day, that no one can become a citizen in these states unless he profess the Roman Catholic faith. Some of the civil arrangements are in an exceedingly primitive state. Uri and Schwytz have not yet arrived at the principle in political science of delegating the legislative function to representatives. All the male inhabitants above eighteen or twenty years of age meet in their respective cantons once or twice a-year, in what we should call a parliament; the place of assembly being an open ground, and the proceedings being in some measure presided over by the *landammann*, or chief magistrate, who decides the passing of any project of law by a general show of hands. The majority carries; but it is not always safe to belong to the greater number of votes. Some years ago, when the spirit of the people was roused, the minority in the cantonal parliament of Schwytz twice drove the majority from the field with sticks. A general confusion of affairs ensued, in which there could not be said to be any government at all; but matters were finally patched up by the interference of the diet and federal troops. Rude as is this state of affairs, we should not deal too hardly on the citizens of either canton. The intrepid manner in which they defended the country from French aggression, shows that the spirit of Swiss patriotism was far from being extinguished amongst them.

But I must bring my observations to a conclusion. The steamer is arrived at the quay of Lucerne: the grey fleecy clouds have gathered on the summit of the proud Pilatus, and it is time to adjourn to our quarters for the evening.

* It is proper for me to mention that within these few years serious doubts have begun to be entertained in Germany respecting the truth of Tell's exploits. I am inclined to think that the history of the hero is founded in truth, but may have been greatly embellished by traditionary legend.

JOHNSON,

A STORY OF A COUNTRY TOWN.

THE small country town of H——, in which I reside, is a bustling, thriving, little place in the western part of the kingdom. Amongst other evidences of its prosperity, it exhibits an unusual number of respectable shops. Being a small community, we, like all small communities, take sometimes a very great interest in very little matters, especially when of a local nature. It is also said, and cannot well be denied, that we are a little given to scandal. We know what every body in our little town is about, and every body canvasses every other body's affairs with the greatest freedom. Yet the old-established inhabitants have a sort of clannish regard for each other, and we do not usually treat any with severity, except strangers who may be endeavouring to obtain a settlement amongst us.

Some years ago, one of our principal shopkeepers died in a state of insolvency, and his shop was shut up, to the great disfigurement of the town, as it occupied a very conspicuous place near its centre. Every one felt concerned at the dullness which its closed windows gave to the street; but the predominant feeling was curiosity as to who should be its next tenant. On this point a variety of rumours were set afloat. One day, it was confidently asserted that the shop was taken by a great tea-merchant from the capital; the next, an extensive haberdasher from an adjacent city was said to be the man. At length, a tenant did appear—a native of England—a mild, gentle-looking man, of somewhat slender form, and about forty years of age. Strange to say, nobody knew or could learn any thing about him; neither whence he came nor what were his means. It was only seen that he opened shop as a tea-merchant and grocer under the name of Johnson.

The public remained in this ignorance for a few weeks; but at length a rumour got abroad that Johnson was a person of doubtful character. By and by, specific charges were heard of. It was said that he had once committed an extensive forgery, and only escaped the penalty of the law through the forbearance of the parties whom he had injured. Another charge was, that he had deserted his wife and three children, who were now starving in a remote and obscure village in England. He was also said to be a fraudulent bankrupt, having robbed his creditors to a large amount. He was, lastly, a person destitute of religious principle.

I cannot say that we were much grieved at learning all this of the new comer, for we had a decided prejudice against him, and would have much preferred seeing his shop occupied by one of the native inhabitants of our burgh. Some went so far as to entertain a decided wish to drive Johnson from amongst us, and with this view did not scruple to give currency to the scandals which had been raised against him. The consequence of their efforts was that Johnson obtained no business. Three weeks elapsed from his opening shop, without his being known to have obtained a single customer except for the most trifling articles.

Curious to know how he felt under the treatment he was receiving, I and another shopkeeper availed ourselves of the opportunity presented by our undertaking to collect subscriptions for the widow (herself dying) and small family of a respectable townsman—a tanner to business—who had died suddenly, and in poor circumstances, in consequence of

certain heavy losses he had recently sustained. Provided with this apology—for we had no hope whatever of obtaining a contribution from Johnson—we entered his shop; my friend winking significantly to me as we did so. To our surprise, we were received with the utmost kindness of manner. We had expected blustering hauteur and insolence, from which my companion hoped to derive some amusement. But the very opposite conduct was exhibited, and I must say it threw us out. In order to draw him forth, we asked how he had found business since he came to H——; to which he replied, that he had as yet done nothing, but it was not surprising, as he was wholly a stranger, and no doubt it was natural for every one to prefer old acquaintances. He hoped, however, that, by and by, when the people should know him a little better, they would favour him with a share of their custom. "And," he added with a significant expression, but with the same gentle smile, and the same mild tone, "when the good folk here know me a little longer, and consequently a little better, they will, I hope, see cause to change the opinion they have formed of me, and will be sorry, I dare say, for having believed—still more sorry for having taken any share in propagating—the absurd stories about me that have been raised by falsehood and malice."

My friend and I were confounded both by the matter and manner of these remarks. We clearly enough perceived that Johnson was perfectly aware, not only of the reports that were in circulation against him, but of the share we had had in propagating them. We did not make any reply, but proceeded to the ostensible purpose of our call. We laid the subscription paper before Mr Johnson, at the same time explaining the circumstances of the case.

Having glanced at the paper, he, without saying a word, went to a little desk at the head of the counter, raised the lid, thrust in his hand, withdrew it, returned to us, and, still without speaking a word, laid a sovereign upon the subscription paper. It was the largest sum which had yet been contributed by any individual. "Poor woman," said Johnson, in a voice which, from another, I should have said was that of true compassionate feeling, "I trust she will yet recover; I hope she is properly attended to, and that the sum which may be collected will be sufficient to put her in some little way of doing."

With feelings which I should not find it very easy to describe, I took up Johnson's contribution, wished him good morning, and, accompanied by my friend, left the shop. The conduct of the man altogether puzzled us. The gentleness of his manner, and the patience and mildness with which he spoke of his want of success in business, and of those who had traduced him, confounded us. We came to the conclusion that he was, after all, merely a consummate hypocrite, and that there was no doubt he would shortly appear in his true colours.

One forenoon, some little time after, my neighbour, Manson, the person who had accompanied me in my call on Johnson with the subscription paper, and who had, I must say it, been particularly industrious in spreading the evil reports, called me into his shop, and put a letter into my hands. It was from Johnson. Here it is:—

"Sir—It is with very sincere regret I have learnt that you have been circulating reports highly prejudicial to my character, and utterly ruinous to my interests. This is a very serious charge; but I beg of you to understand, that I do not bring it against you without having sufficient proof of its truth. Such proof I could command as would at once obtain for me large damages in a court of justice. But it is not my intention to adopt such a course with you; I mean rather to appeal to your reason and your better feelings, and to try whether I cannot, by such a proceeding, bring you to a sense of the injustice you have done me.

I now, sir, make this appeal, and am very sure that a little reflection will point out to you the impropriety of your conduct towards me, and induce you at once to express your regret for it, and to desist from it in time to come. Please to remember, that I have never done *you* the smallest injury, either by word or deed, either directly or indirectly. Why, then, this unprovoked hostility towards me? Allow me, in conclusion, to say, that it would afford me inexpressible happiness could I by any means induce you to think better of me than you at present do. I would do much, sir, to gain your good will, if I might not aspire to your friendship. In the mean time, have the kindness to desist from further injuring me.—I am, Sir," &c.

"Well, Manson," said I, after having read the letter, "what do you think of it?"

"Why, that its writer is a mean-spirited, sneaking, canting fellow, and a most accomplished hypocrite," replied Manson.

"Then, upon my word," said I, "I cannot agree with you; neither can I help beginning to entertain a somewhat different opinion of this man. I now doubt the truth of much that has been said against him. I do not know how it is, but this unalterable gentleness of his has a strange effect on me; it is beginning to make me feel somewhat ashamed of myself as regards the part I have acted towards him. In truth, this mildness of spirit, with all its seeming inertness, appears to me to possess an extraordinary power. Had he given us bad language that day we called with the subscription paper, my prejudices would have been confirmed; but his suavity has completely disarmed me. What do you mean to do, Manson, with regard to that letter?"

"Why, to take no notice of it. I do not mean to answer it; I wish to have no correspondence with such a character."

About a week after this we had a subscription ball in H——, got up by some of our gayer and wealthier townsmen. Amongst those present were Johnson and his sister, a lady-like girl of about two-and-twenty, to whom, it was said, her brother was extremely kind and attentive. On this occasion, Johnson and his sister were treated with marked discourtesy on all hands. Some, as if studiously to insult them, turned their backs on them when they approached; others got out of their way with offensive haste; while others, again, sneered at them while they passed. I could observe that Miss Johnson felt keenly the treatment to which her brother and herself were subjected. She looked pale and agitated; and, occasionally, as a more than usually marked instance of disrespect occurred, a blush would hurry over her fine intelligent countenance. Johnson, again, though apparently not less sensible of the contumely to which he and his sister were exposed, met it differently; his demeanour, as he perambulated the ball room, with his sister leaning on his arm, was calm and collected, while a gentle and significant, but almost imperceptible, smile played about his rather handsome mouth. I really could not help admiring his calmness and self-possession under these trying circumstances.

Greatly struck by what had fallen under my observation, I could not help reflecting, as I went home, that surely he must be no common man who could thus maintain his temper under such trying circumstances; and I began to feel a friendship for him taking possession of me. Being now anxious to be convinced of his worth, I determined on stepping into his shop now and then, and having some conversation with him. Let me here parenthetically remark, that, in spite of the rumours that had been circulated against him, and in spite of the efforts of a clique to injure his business, or, rather, to prevent him obtaining any, Johnson was gradually acquiring a fair share of custom. His mildness and civility, together with the perfect propriety of his conduct, were gradually overcoming prejudice and winning confidence. People said, "As to the unfavourable reports of Mr Johnson's character, we must suspend judgment; we believed them at first, certainly, but now we have our doubts. Besides, his articles are, at least, as reasonable in price, and certainly much better in quality, than those of many dealers in town."

In pursuance of the resolution I had formed, I called a day or two after the ball on Mr Johnson, and sat for nearly two hours with him; fascinated at once by his singularly pleasant and gentle manners, by his great intelligence, and by the extraordinary extent and variety of his information. There was, even in the tones of his voice, a charm that I found exercising a powerful influence over me.

I frequently repeated my calls, and after each interview became more and more satisfied that Johnson had been grievously wronged. Under this impression, I took every opportunity of expressing amongst my friends and acquaintances my strong doubts of the truth of the reports. To my great gratification, I found almost every body, although they had no such opportunities of correcting their opinions, willing to believe that he had been unjustly dealt by.

By and by, Mr Johnson and I became so intimate, and I so assured of his innocence as regarded the special accusations which scandal had circulated against him, that I ventured, one day, to mention them to him. He said, calmly, "My dear sir, I knew from the very first of the circulation of these rumours, but, excepting one letter to Mr Manson, I have never made any attempt to meet them with a denial, being certain that my own conduct would be their only effectual refutation. Since you have adverted to the subject as a friend, I will explain all to you. As is often the case, these reports are not altogether creatures of any one's imagination, but have a certain basis in fact, though not as applicable to me." He then proceeded to show—proving at the same time the truth of what he said by various documents—that the forgery of which he had been accused, instead of being committed by him, had been committed *upon* him; and this by a nephew of his own, whom he had forborne to prosecute, although his loss by the act had exceeded L.2000. As to the desertion of wife and children, he also satisfied me, first, that he had never been married at all, nor ever had had any children; next, that the family alluded to was the widow and children of his brother, whom he was now supporting, and had supported for many years. He showed me a number of letters from the widow, who resided in a distant part of England, and several from her elder children, whom he was educating; all of which were filled with expressions of the warmest love and gratitude.

A letter which he next produced, and which he had but a day or two before received from the rector of Combermeath, his native parish, was written in an affectionate strain, and bore, in an incidental way, the strongest testimony to his moral and religious character.

"Now," said he, laughing, "we come to the last remaining charge—my fraudulent bankruptcy. Well, it is true, perfectly true, that I did stop payment about fifteen years since; chiefly in consequence of the forgery on me by my nephew, and partly in consequence of large losses otherwise. But success in business enabled me at a subsequent period to pay all my creditors in full, including interest. Of the satisfaction of my creditors with my conduct on the occasion of which I speak, I have evidence, inscribed, not indeed on a tablet of brass, but on a vessel or rather utensil of silver, which I will show you."

Having said this, he rose, went to a corner of the shop, and drew a bell-pull. His sister—there being an internal communication between the shop and the house which was above—answered the summons.

"Izzy, dear," said Johnson, "will you be so kind as bring down the salver which was presented to me by my good friends at Combermeath."

Miss Johnson quickly appeared with a large, massive, and richly ornamented piece of plate, which her brother desired her to put into my hands; directing my attention at the same time to an inscription in the centre. This inscription I read, and found it to be a flattering testimonial from Mr Johnson's creditors to the excellence of his character, and expressing their deep sense of his rare integrity, as exemplified in the circumstance of his having paid in full, and with interest, the several sums he owed them, after he had been legally discharged of the same.

Dear reader, the man of whom I have been speaking—the man who was so slandered and traduced when he first came amongst us—who was called every thing that was bad—who was shunned and despised—is now first magistrate of H——, and has long been esteemed, as he indeed is, one of the worthiest men in the county.

THE LIFE AND POETRY OF COLERIDGE.

FIRST ARTICLE.

Samuel Taylor Coleridge was born in 1772, at Ottery St Mary, in Devonshire; of which parish his father was vicar for many years, having been previously an eminent schoolmaster at South Moulton, and acknowledged to be a man of considerable learning. His scholarship was indeed evinced by several learned minor productions; while the extent of his household cares is equally evinced by the fact of our poet being the youngest of eleven children. His emoluments being by no means commensurate with his family, a presentation to Christ's Hospital in London was procured for his son Samuel, who, soon after his arrival at that school, distinguished himself by undeniable talent and undeniable eccentricity. In his Literary Biography (*Biographia Literaria*), our poet affords an excellent and amusing account of his schoolmaster (the Rev. James Bowyer), to whom he was materially indebted for a large amount of classical knowledge, imparted in a somewhat more earnest and scholar-like manner than is common with such autocratic functionaries as the head-masters of public schools. "Even before my fifteenth year," says Coleridge, "I had bewildered myself in metaphysics and theological controversy. Nothing else pleased me. History and particular facts lost all interest in my mind. Poetry (though for a school-boy of that age I was above par in English versification, &c.)—poetry itself, yea, novels and romances, became insipid to me." He preferred musing and discoursing

> "Of Providence, foreknowledge, will, and fate,
> Fix'd fate, free-will, foreknowledge absolute,"

to any other kind of occupation and research. "This preposterous pursuit was," says he, "beyond doubt, injurious, both to my natural powers and to the progress of my education. It would perhaps have been destructive, had it been continued; but from this I was auspiciously withdrawn, partly, indeed, by an accidental introduction to an amiable family; chiefly, however, by the genial influence of a style of poetry, so tender, and yet so manly, so natural and real, and yet so dignified and harmonious, as the sonnets, &c., of Mr Bowles. Well were it for me, perhaps, had I never relapsed into the same mental disease—if I had continued to pluck the flower and reap the harvest from the cultivated surface, instead of delving into the unwholesome quicksand mines of metaphysic depths." Coleridge has left a testimony of his gratitude to Mr Bowles in a sonnet included in his works; but his appreciation of the compositions of this bard was shown more strikingly in his making, "within less than a year and a half, more than forty transcriptions of them, as the best present I could offer to those who, in any way, won my regard."

Coleridge remained at Christ's Hospital school till he was nineteen; and having then outstripped all his schoolfellows, and become "captain," he was entitled to an exhibition (a species of partially gratuitous education) at Cambridge University. In 1791, he entered Jesus' College, Cambridge, where his conduct does not appear to have been academic, or regular, in so far as he could not submit to the discipline essential to obtain honours or even approbation. Not that he was without honours, but he could not drudge at mathematics sufficiently to qualify him to outvie men immeasurably his inferiors in other acquirements. Partly from freak, and partly from disappointment in love, he foolishly quitted Cambridge, when pecuniary supplies were as necessary to him as knowledge. Arriving in London, moneyless and spiritless, he wandered about the streets in a state of frenzied melancholy, in a strong fit of which he enlisted in the 15th Light

Dragoons, under the *alias* of "Cumberback," a name taken at the moment, as he himself tells us, from an idea of his unskilful horsemanship, and as a designation that his horse would have given him, had it possessed the power of language. The cause of his release from this servitude is variously related, but always as resulting from the accidental discovery of his learning. By some it is said that his character was discovered by his officer, upon reading a Latin line which Coleridge had scribbled in the stable, under his saddle. To whatever cause his discharge was owing, his loss was not severely felt by the army, for he never could rub down his horse, or ride it. In a tap-room at Reading, immediately after his return, were written the chief portion of his "Religious Musings," considered by Bowles the "most correct, sublime, chaste, and beautiful, of his poems."

At this period the French Revolution had inebriated most of the enthusiastic minds of Europe, and among others those of Coleridge, Mr Southey (the celebrated poet), and Mr R. Lovell, a young gentleman of some genius. They entertained a wild scheme of founding a kind of primitive society in the wilds of America, to be denominated "Pantisocracy," that is, an equality in every thing. On the banks of the Susquehannah were this worthy trio to found a colony that should realise all the conceptions of the golden age, without the aid of gold, for none of them had enough for himself, and the three together could not make up enough to pay the expenses of the voyage. Mr George Burnet, a student for the church, made a fourth associate. The four lingered at Bristol, displaying the advantages of the scheme, until the possibility of going at all became no longer questionable. The three poets married three sister graces of the unpoetical name of Fricker; Mr Southey quietly settled himself down as a law student at Gray's Inn; and Mr Coleridge and his wife departed to reside in a cottage at Clevedon, on the banks of the Severn, a few miles from Bristol.

A more suitable residence for a poet could not have been selected than Clevedon, although it has now become a fashionable watering-place for the Bristolians. Coleridge has a beautiful little poem composed here, commencing—

"My pensive Sara! thy soft cheek reclined
Thus on mine arm, most soothing sweet it is
To sit beside our cot—our cot o'ergrown
With white-flower'd jasmin, and the broad-leaved myrtle
(Meet emblems they of innocence and love!)
And watch the clouds, that late were rich with light,
Slow saddening round, and mark the star of eve,
Serenely brilliant (such should wisdom be),
Shine opposite! How exquisite the scents
Snatch'd from yon bean-field! and the world so hush'd!
The stilly murmur of the distant sea
Tells us of silence!"

It was the good fortune of the writer of this sketch to visit and enjoy the beauties of Clevedon in company with perhaps, in many respects, a greater than even Coleridge, and unquestionably a more useful man of genius—the late celebrated Rev. Robert Hall, probably the most powerful pulpit orator of any age. We frequently rode over the very scenery that had most probably inspired Coleridge; nor was the tongue of the living preacher less voluble and eloquent with matters of high moment than that of the deceased poet. But this is too interesting a topic for the writer to trust himself upon.

It must not be supposed that the cottage taken by our poet was an expensive tenement, for it does not appear that at the time he engaged it—at the rent of L.5 per annum—that it possessed more than the four bare walls, the roof, doors, and windows. With the aid, however, of friends and tradesmen, all essential decorations and appurtenances were provided; and as to his income, he informed a friend that he felt little solicitude at present upon that point, inasmuch as Mr Cottle, a bookseller at Bristol, had agreed to give him one guinea and a half for every hundred lines of rhyme or blank verse.

It was, we presume, about this period that Coleridge penned the following simply beautiful sonnet "To a friend who asked how I felt, when the nurse first presented my infant to me":—

Charles! my slow heart was only sad, when first
I scann'd that face of feeble infancy,
For dimly on my thoughtful spirit burst
All I had been and all my babe might be!
But when I saw it on its mother's arm,
And hanging at her bosom (she the while
Bent o'er its features with a tearful smile),
Then I was thrill'd and melted, and most warm
Impress'd a father's kiss; and all beguiled
Of dark remembrance and presageful fear,
I seem'd to see an angel's form appear.
'Twas even thine, beloved woman mild!
So for the mother's sake the child was dear,
And dearer was the mother for the child."

Notwithstanding the beauty of Clevedon, our poet speedily discovered that its situation was exceedingly disadvantageous in many respects, and chiefly in that of distance from libraries. He therefore returned to Bristol. Of this period of his life several interesting letters and notices are preserved in a volume of "Recollections," which his patron Mr Cottle has given to the world. It appears that Mr Cottle entertained the kindest wishes towards him, and sedulously endeavoured, by offers of liberal remuneration, to induce him to exert the noble powers which he possessed. But Coleridge entirely wanted the power of application, and lived in the world as if subsistence were to be obtained as it was in the golden age. The difficulty he experienced in fulfilling his engagements to Mr Cottle, produced some penitential and interesting letters, in the chief of which, dated Feb. 22, 1796, he says—"It is my duty and business to thank God for all his dispensations, and to believe them the best possible; but indeed I think I should have been more thankful if he had made me a journeyman shoemaker, instead of an author by trade. I have left my friends—I have left plenty," &c. . . . "So I am forced to write for bread!—write the flights of poetic enthusiasm, when every minute I am hearing a groan from my wife—groans, and complaints, and sickness! The present hour I am in a quickset of embarrassments, and whichever way I turn, a thorn runs into me! The future is a cloud and thick darkness! Poverty, perhaps, and the thin faces of them that want bread looking up to me," &c.

Yet he occasionally seemed disposed to make energetic efforts. It was about this time that he projected a fourpenny periodical paper, styled "The Watchman." Prospectuses were issued, headed as usual, "Knowledge is power." To secure a corps of subscribers, the author undertook a journey to beat them up in various midland towns. The journey was successful as far as regarded the securing of 1000 subscribers, and the display of his talents as a preacher. In some of the dissenters' chapels in these towns, he delivered discourses, which, by courtesy, might be styled sermons, but were in reality political harangues. The disposition of his mind at this time for the clerical profession may be judged from an entry in his note-book, where, after chronicling some very unspiritual proceedings on his own part, he adds—"N.B.—I preached yesterday!" "The Watchman," as might have been expected, was too dry for general readers, and died in the ninth number; many subscribers having discontinued it at the several intermediate numbers—one gentleman because "he did not find his boys improve much under it!"

After this abortive attempt, "I retired," says he, "to a cottage at Storvey (in Somersetshire), and provided for my scanty maintenance by writing verses for a London morning paper. I saw plainly that literature was not a profession by which I could expect to live; for I could not disguise from myself that, whatever my talents might or might not be in other respects, yet they were not of the sort that could enable me to become a popular writer." As a poet, however, he was better received by the public, for a second edition of an early published poetical volume was now called for, to which were added poems by Charles Lamb and Charles Lloyd.

In this or some similar volume appeared his most admired love poem, "Genevieve." Its simple beauty and exquisite pathos, in conjunction with its fame, induce us to give it entire.

"All thoughts, all passions, all delights,
Whatever stirs this mortal frame,
Are all but ministers of Love,
And feed his sacred flame.

Oft in my waking dreams do I
Live o'er again that happy hour,
When midway on the mount I lay,
Beside the ruin'd tower.

The moonshine stealing o'er the scene,
Had blended with the lights of eve;
And she was there, my hope, my joy,
My own dear Genevieve!

She lean'd against the armed man,
The statue of the armed knight;
She stood and listen'd to my harp
Amid the lingering light.

Few sorrows hath she of her own,
My hope, my joy, my Genevieve!
She loves me best whene'er I sing
The songs that make her grieve.

I play'd a soft and doleful air,
I sung an old and moving story—
An old rude song that fitted well
The ruin wild and hoary.

She listen'd with a flitting blush,
With downcast eyes and modest grace,
For well she knew I could not choose
But gaze upon her face.

I told her of the knight that wore
Upon his shield a burning brand;
And that for ten long years he woo'd
The lady of the land.

I told her how he pined; and ah!
The low, the deep, the pleading tone
With which I sang another's love
Interpreted my own.

She listen'd with a flitting blush,
With downcast eyes and modest grace
And she forgave me that I gazed
Too fondly on her face.

But when I told the cruel scorn
Which crazed this bold and lovely knight,
And that he cross'd the mountain woods,
Nor rested day or night;

But sometimes from the savage den,
And sometimes from the darksome shade,
And sometimes starting up at once,
In green and sunny glade,

There came and look'd him in the face,
An angel beautiful and bright;
And that he knew it was a fiend,
This miserable knight!

And how, unknowing what he did,
He leap'd amid a murderous band,
And saved from outrage worse than death
The lady of the land;

And how she wept and clasp'd his knees,
And how she tended him in vain—
And ever strove to expiate
The scorn that crazed his brain:

And that she nursed him in a cave;
And how his madness went away,
When on the yellow forest leaves
A dying man he lay;

His dying words—but when I reach'd
That tenderest strain of all the ditty,
My faltering voice and pausing harp
Disturb'd her soul with pity!

All impulses of soul and sense
Had thrill'd my guileless Genevieve—
The music, and the doleful tale,
The rich and balmy eve;

And hopes, and fears that kindle hope,
An undistinguishable throng;
And gentle wishes long subdued,
Subdued and cherish'd long!

She wept with pity and delight,
She blush'd with love and maiden shame;
And like the murmur of a dream
I heard her breathe my name.

Her bosom heaved, she stept aside;
As conscious of my look she stept—
Then suddenly, with timorous eye,
She fled to me and wept.

She half enclosed me with her arms,
She press'd me with a meek embrace,
And bending back her head, look'd up
And gazed upon my face.

'Twas partly love, and partly fear,
And partly 'twas a bashful art,
That I might rather feel than see
The swelling of her heart.

I calm'd her fears; and she was calm,
And told her love with virgin pride;
And so I won my Genevieve,
My bright and beauteous bride!"

Nearly all the love poems of Coleridge display a peculiar pathos and classic purity. There is an unusual absence of extravagance and of license whenever he sings—to employ his own words—

"Of transient joys that ask no sting
From jealous fears, or coy denying;
But born beneath Love's brooding wing
And into tenderness soon dying,
Wheel out their giddy moment, then
Resign the soul to love again."

In 1798, Coleridge went to Shrewsbury to succeed Mr Rowe in preaching to an Unitarian congregation there. Here it was that Hazlitt (then young) became acquainted with him; and from Hazlitt's description of him, we are brought very nearly to the pleasure of an introduction to the poet without the formality of an annunciation of names and titles. "His complexion," according to this gentleman's account, "was at that time clear, and even bright. His forehead was broad and high, light as if built of ivory, with large projecting eyebrows, and his eyes rolling beneath them, like a sea, with darkened lustre. His mouth was gross, voluptuous, open, eloquent; his chin good-humoured and round; but his nose, the rudder of the face, the index of the will, was small, feeble, nothing like what he has done (that is, compared with his powers and intentions). In his person he was rather above the common size, inclining to the corpulent. His hair (now alas, grey!) was then black and glossy as the raven's, and fell in smooth masses over his forehead." From a portrait of him when young, which we have seen at Mr Cottle's house at Bristol, we would have said that he possessed at that time a particularly pleasing countenance.

His friends, the Messrs Wedgwood, munificently granted him an annuity (L.150 per annum) to enable him to devote himself to study; and in 1798, he visited Germany for this purpose. His friend, the poet Wordsworth, accompanied him, and on returning to England, left him to study at Gottingen. On his return from Germany, in 1800, he joined his friends, Wordsworth and Southey, then residing amongst the lakes of Cumberland. He now published his translation of Schiller's Wallenstein, which has been pronounced by an eminent critic to be the best translation in the English language. He was shortly after induced to undertake the conduct of the literary and political department of the *Morning Post* newspaper, in which duty he "wasted the prime and manhood of his intellect," according to the belief of his friends.

About this time Coleridge attempted, with Sheridan's countenance, to bring a tragedy upon the stage at Drury Lane. Of the merits of this piece we know nothing; but it is affirmed that at the rehearsal it was spoilt for the actors, by the inability of Sheridan to restrain what he thought a good jest. One scene represented a cave, with streams of water weeping down the sides; and the opening words were intended for a species of imitation of the sound, being "Drip, drip, drip!" Upon which Sheridan repeated aloud, "Drip, drip, drip!—why, bless my soul, there's nothing here but *dripping!*" The consequent chorus of laughter among his myrmidons was fatal to the piece.

In 1804, Coleridge visited Malta, of which Sir Alexander Ball was then governor. Sir Alexander being at that time in want of a secretary, and becoming pleased with Coleridge, appointed him to that office, with, it is said, a salary of L.800 per annum. At the best of times, few men could have been more unfit than our poet for office business; but it does not appear improbable that, at this period, he was indulging in the habit of opium-drinking. Be this as it may, he was secretary no longer than nine months, at the ex-

piration of which he left Malta and visited Italy, Mount Ætna, &c., and returned to England by way of Leghorn. His known political bias and writings had rendered his presence in those countries hazardous, and it was only by an amusing but strong instance of devotedness on the part of an unscrupulous captain, captivated by his discourse, that he obtained his passport. The captain *swore* that Coleridge was an old acquaintance of his whom he had taken as his steward; and upon inventing a circumstantial description of his life and residence, rescued the jeopardised man of letters.

OCCASIONAL NOTES.

DISINTERESTEDNESS OF OPINION.

The Niger Expedition has signally failed. We have no wish to discuss the general subject, but there is one circumstance on which we would make a few remarks. Mr Jamieson, a Liverpool merchant, described as of "high character," gave a warning of the fate which the expedition was likely to meet. He was enabled to do so by his knowledge of the physical conditions of the country watered by the mouths of the Niger, this knowledge having been obtained in the course of conducting mercantile transactions in that country. The warning was disregarded, and Mr Jamieson was subjected, on account of it, to much vituperation by the promoters of the expedition, who professed to see in his opposition only interested views, conceiving that he might regard the proceedings of the Slavery-Extinction Society as likely to interfere with his own trade. Mr Jamieson, nevertheless, sent instructions to Mr Beecroft, the commander of a vessel belonging to him which traded about the mouths of the Niger, ordering that he should be ready to afford any assistance or relief that might be in his power, in the event of his predictions as to the expedition being fulfilled.

When the two last vessels of the expedition, the Wilberforce and Albert, were returning down the river in the greatest distress, conducted by the surgeon and naturalist, they were met at Eboe by Mr Beecroft, who had come in his little steamer in order to render them assistance. It is acknowledged that the unfortunate gentlemen on board the two vessels were at this time reduced nearly to despair, and that they would scarcely have been able to get to the open sea unassisted. Beecroft, in conformity with the instructions which he had received from Mr Jamieson, lent them all the aid in his power, and proved the means of rescuing them from the horrors of their situation.

This is a statement which speaks for itself on the main point, namely, the magnanimity of Mr Jamieson, to whom we conceive the universal approbation of his country to be due. But do we not also see in it the danger of too readily assuming that testimony must needs be false, when it comes from a party who may be presumed to have some interest in the view which he takes? It is generally, by common minds, thought quite decisive on such a point, when the person giving the testimony can be made out to have, by the barest possibility, a selfish reason for speaking as he does. Now, undoubtedly, many opinions are adopted for selfish reasons; but they are not always so. It often happens that the connexion of the person with the case is more that of experience or knowledge than that of interest. Many men are removed, by native integrity and the independence of their circumstances, above selfish considerations which would operate with others, and are able to give a correct opinion without regard to their interests. It is a great pity to lose all the benefit of testimony of this kind merely from blind adherence to a rule that where there is an interest there cannot be a true judgment. It may often happen, as in the case of Mr Jamieson, that very important evidence is thus lost, and that great evils come in consequence. It would surely be proper in such cases to use some cool discrimination as to the character of the person giving testimony, and allow it a weight in proportion to the presumed exemption of the party from the influences which are apt to bewray human opinion.

STATE OF THE STREETS OF LONDON.

Last summer, an article appeared in the Journal respecting the state of the streets of London, and the danger to public health from the defective arrangements for removing the refuse constantly accumulating in so large a city. This paper somehow offended a local feeling, which we could not have previously believed to exist in the metropolis; but we are glad to observe that what was combated when said by one living at a distance, has been repeated by metropolitan newspapers in such terms as confirm the truth of all that we advanced. The *Morning Herald* and *Times* have recently spoken of the streets as in a state thoroughly disgraceful to the first city in the world. The former paper (December 16, 1841) says:—"Nothing is so much required in London as improvement in the management of its streets. At present, the streets are cleaned by persons who pay for permission to do so, and who profit by the sale of the stuff they take away. This, assuredly, is a most mistaken plan; for the contractors naturally calculate, that, as the refuse is sure to come to them, it does not matter how long they allow it to lie; and the result is the keeping of the streets (more especially those in the districts inhabited exclusively by poor people) in a most odious if not pernicious state of uncleanliness. To remedy this disgraceful absurdity, what is to hinder the citizens of London from having their scavengerings done under the care of properly constituted committees of rate-payers, whose first object it should be to keep the city clean, and only the second to make money by the refuse?" The *Times* (January 1842) adverted to the quantities of mud allowed to accumulate in the principal thoroughfares, and the inadequacy of all the arrangements for cleaning the city. "At present," it said, "London is one of the dirtiest cities in Europe, although no other is so well supplied with water." We need scarcely remark, what a distressing confirmation of all these views was supplied a few years ago by the evidence of Dr Southwood Smith, Dr Arnott, and others, before a committee of the House of Commons.

None but the ignorant and thoughtless can regard this as merely a question of taste or convenience. The health of vast multitudes of people depends on it. Dirt, as well as war and famine, annually reckons its hordes of victims; and we thoroughly believe that nowhere is it more destructive than in the more densely peopled parts of London.

HISTORY OF WHEAT IN SCOTLAND.

The great improvements in agriculture during the last century, have resulted in giving us perhaps a too mean opinion of its condition in earlier times. We find, for instance, that, in some modern works, the cultivation of wheat is spoken of as having been quite a wonder in Scotland at no distant date. In the New Statistical Account of Scotland, there is a statement, repeated in M'Culloch's Dictionary of Commerce, that this crop was so little known in 1725, that a field of eight acres sown with it near Edinburgh in that year, was visited as a curiosity. There may be some foundation for this anecdote; but it is certainly false as conveying the idea that wheat was then a new and rare article of produce in our northern soil. We shall endeavour to make this good by a reference to documents of incontestible authority.

An agricultural report as to Mid-Lothian, in 1793, states the number of acres in this county under wheat to be from 7000 to 8000; but that towards the beginning of the century there could not be more than 1000 acres under wheat. The latter statement, we think, is probably under the truth; still it is very different from the eight-acre story.

We have next the fiars of our county, beginning in 1635, contracted into a table giving the average of every ten years. In this table we have the average of three kinds of each grain—highest, middle, and lowest. And there are five divisions in the table—1. Wheat; 2. Bere or barley; 3. Oats; 4. Oatmeal; 5. Peas. From which it clearly appears, that wheat was an ordinary article of produce in 1635, and it is rather curious that the average then was higher than it was a century later.

In 1663, the first corn act was passed in the Scottish parliament; by it wheat was allowed to be exported under 20s. sterling per boll; barley, 13s. 4d.; and oats and peas, 8s. 10d. In 1695, the first bounty was allowed on exportation, namely, 10 merks per chalder of 16 bolls.

Proceeding another century back, we come to the period before the Reformation in 1560, and here we are able to quote two or three rentals connected with the religious establishment of the country.

From "Grierson's Delineation of St Andrews," it appears that the last Catholic Archbishop made a return of his income as follows:—Wheat, 489 bolls; bere, 666; oats, 1072; and in money, L.2904, 7s. 2d. Scots, then valued about one-sixth of sterling, not one-twelfth as at present. In short, our primate must have had equal to about L.5000 sterling a-year. The rental of the priory of St Andrews, which some time before had been disconnected with the archbishopric, greatly exceeds the above, but the proportions are similar.

The Abbey of Holyrood was founded and endowed by David I. in 1128, for canons regular of St Augustine. Besides privileges of various kinds, the king gave them portions of land in different places. Before the Reformation, the annual revenues of the monastery were—442 bolls wheat, 640 bolls bere, 560 bolls oats, 500 capons, 2 dozen hens, 2 dozen salmon, 12 loads salt, besides a number of swine, and about L.250 sterling in money.

These rentals, the authenticity of which is unquestionable, appear to us to denote that the proportion of the cereals in our early agriculture was not greatly dissimilar to what it is in Lothian and Fife at the present time.

THE IRISH PIPERS.

BY WILLIAM CARLETON.

Those who minister to amusement are every where popular characters, and fully as much so in Ireland as other countries. Here, amongst the people at large, no sort of person is more kindly regarded than the wandering fiddler or piper, two classes of artists who may be said to have the whole business of keeping Paddy in good humour upon their shoulders. The piper is especially a favourite in the primitive provinces of Munster and Connaught. In Leinster they are not so common; and in the north may be described as rare, though I am not sure but that, for this very reason, they are as welcome in Ulster as in the other provinces, their notes producing an impression which is agreeable in proportion to its novelty.

Of course it is but natural that there should exist a striking resemblance between the respective habits and modes of life which characterise the fiddler and piper. For this reason, in describing the piper, I shall take leave to use the same terms which I lately employed in another place* in describing the fiddler, changing only the names of the instrument and the musician. "The piper is a being peculiarly free from care, especially if he be blind, which he generally is. His want of sight circumscribes his other wants, and, whilst it diminishes his enjoyments, not only renders him unconscious of their loss, but gives a greater zest to those that are left him, simple and innocent as they are. He is in truth a man whose lot is happily cast, and whose lines have fallen in pleasant places. The phase of life which is presented to him, and in which he moves, is one of innocent mirth and harmless enjoyment. Marriages, weddings, dances, and merry-makings of all descriptions, create the atmosphere of mirth and happiness which he ever breathes. With the dark designs, the crimes, and outrages of mankind, he has nothing to do, and his light spirit is never depressed by their influence. Indeed, he may be said with truth to pass through none but the festivals of life, to hear nothing but mirth, to feel nothing but kindness, and to communicate nothing but happiness to all around him. He is at once the source and the centre of all good and friendly feelings. By him the aged man forgets his years, and is agreeably cheated back into youth; the labourer snatches a pleasant moment from his toil, and is happy; the care-worn ceases to remember the anxieties that press him down; the boy is enraptured with delight, and the child is charmed with a pleasure that he feels to be wonderful.

Surely such a man is important, as filling up with enjoyment so many of the painful pauses in human misery. He is a thousand times better than a politician, and is a true philosopher without knowing it. Every man is his friend, unless it be a rival piper; and he is the friend of every man, with the same exception. Every house, too, every heart, and every hand, is open to him; he never knows what it is to want a bed, a dinner, or a shilling. And what more, it may be asked, can the cravings of a human heart desire!

And yet, alas! there is no condition of life without some remote or contingent sorrow. Many a scene have I witnessed, connected with this very subject, that would wring the tears out of any eye, and find a tender pulse in the hardest heart. It is indeed a melancholy alternative that devotes the poor sightless lad to an employment that is ultimately productive of so much happiness to himself and others. This alternative is seldom resorted to, unless when some poor child—perhaps a favourite—is deprived of sight by the terrible ravages of the small-pox. In life there is scarcely any thing more touching, than to witness in the innocent invalid the first effects, both upon himself and his parents, of this woeful privation. The utter helplessness of the pitiable darkling, and his total dependence upon those around him—his unacquaintance with the relative situation of all the places that were familiar to him—his tottering and timid step, and his affecting call of 'Mammy, where are you?' joined to the bitter consciousness on her part that the light of affection and innocence will never sparkle in those beloved eyes again—all this constitutes a scene of deep and bitter sorrow. When, however, the sense of his bereavement passes away, and the cherished child grows up to the proper age, pipes are procured for him by his parents, if they are able, and if not, a subscription is made up among their friends and neighbours to buy him them. All the family, with tears in their eyes, then kiss and take leave of him; and his mother, taking him by the hand, leads him, as had been previously arranged, to

* In a paper on Irish Fiddlers, contributed to the late excellent periodical entitled *The Irish Penny Journal*.

the best piper in the neighbourhood, with whom he is left as an apprentice. There is generally no fee required; but he is engaged to hand his master all the money he can make at dances, from the time he is proficient enough to play at them. Such is the simple process of putting a blind boy in the way of becoming acquainted with the science of melody."

In addition to this, it may be observed of the piper, that, although most of his associations are drawn from the habits of the people, in contradistinction to those of the higher classes, yet it is unquestionably true that he is strongly imbued with the lingering remains of that old feudal spirit which has now nearly departed from the country. Even although generally neglected by the gentry, and almost utterly overlooked by the nobility, yet it is a melancholy but beautiful trait of "the old feeling," which prompts him always to speak of them with respect and deference. He will admit, indeed, that there is a degeneration; that "the good ould stock is gone; and that the big house is not what it used to be, whin the square's father would bring him into the parlour before all the quality, and make him play his two favourite tunes of the *Fox-Hunther's Jig* and the *Hare in the Corn*. Instead o' that, the sorra ha'porth now will sarve them but a kind of musical coffin, that they call a pianna thirty, or forty, or something that way, that to hear it 'ud make a dog sthrike his father, if he didn't behave himself."

This is the utmost length to which he carries his censure, and even this is uttered "more in sorrow than in anger." On the contrary, nothing can be more amusing than the simple and complacent pride with which he informs his hearers that, "as he passed the big house, the young square brought him in—an' it's himself that knows what the good ould smack o' the pipes is, an' more betoken, so he ought—an' kind father for him to do so—it's the ould square himself that had the true Irish relish for them. I played him all his father's favourites, both in the light way and in the sorrowful. Whin I was done, he slipt five shillins into my hand. 'Take this,' said he, 'for the sake o' thim that's gone an' of the ould times.' He spoke low, an' in a hurry, as if his heart was *in* what he said; an' somehow I felt a tear on my cheek at the time; for it is a sorrowful thing to think how the blessed ould airs of our counthry—the only ones that go to the heart—are now so little known an' thought of, that a fashionable lady of the present day would feel ashamed to acknowledge them, or play them in company. Fareer gair!—it's a bad sign of the times, any how—may God mend them!"

The Irish piper, from the necessary monotony of his life, is generally a man of much simplicity of character—not, however, without a cast of humour, which is at once single-minded and shrewd. His little jealousies and heart-burnings—and he has his share—form the serious evils of his life; but it is remarkable that scarcely in a single instance are these indulged in at the expense of the fiddler, who is by no means looked upon as a rival. Not so his brother piper; for, in truth, the high and doughty spirit of competition by which they are animated, never passes out of their own class, but burns with heroic rage amongst themselves. The lengths to which this spirit has been frequently carried, are ludicrous almost beyond belief. The moment a piper's reputation is established on his beat, that moment commences his misery. Those from the neighbouring beats assail him by challenges that contain any thing but principles of harmony. Sometimes, it is true, they are cunning enough to come disguised to hear him; and if they imagine that a trial of skill is not likely to redound to their credit, they slink off without allowing any one, unless some particular confidant, to become cognisant of their secret.

These comical contests were, about forty or fifty years ago, much more frequent than they have been of late. In the good piperly old times, however, when the farmers of Ireland brewed their own beer, and had whisky for a shilling a-quart, the challenges, defeats, escapes, and pursuits, which took place between persons of this class, were rich in dramatic effect, and afforded great amusement to both the gentry and the people. I remember hearing the history of a chase, in which a piper named Sullivan pursued a rival for eighteen months through the whole province of Munster before he caught him, and all in order to ascertain, by a trial of skill, whether his antagonist was more entitled to have the epithet "great" prefixed to his name than he himself. It appears that the friends and admirers of the former were in the habit of calling him "the Great Piper Reillaghan," a circumstance which so completely roused the aspiring soul of his opponent, that he declared he would never rest, night or day, until he stripped him of the epithet "great" and transferred it to his own name. He was beaten, however, and that by a manœuvre of an extraordinary kind. Reillaghan offered to play against him while drunk—Sullivan to remain sober.

Sullivan, thrown off his guard, and anxious under *any* circumstances to be able to *boast* of a victory over such an antagonist, agreed, and was consequently overcome; the truth being, that his opponent, like Carolan on the harp, was never able properly to distinguish himself as a performer unless when under the inspiration of whisky.

Sullivan, not at all aware of the trick that the other had played upon him, of course took it for granted that, as he had stood no chance with Reillaghan when drunk, he must have a still less one in his sobriety; and the consequence was, that the next morning it was found he had taken leave in the course of the night.

There was, some years ago, playing in the taverns of Dublin, a blind piper named Talbot, whose performance was singularly powerful and beautiful. This man, though blind from his infancy, possessed mechanical genius of a high order, and surprisingly delicate and exact manipulation, not merely as a musician but as a mechanic. He used to perform in Ladly's Tavern in Capel Street, where he arrived every night about eight o'clock, and played till twelve, or, as the case might be, one. He was very social, and, when drawn out, possessed much genuine Irish humour and rich conversational powers. Sometimes, at a late period of the night, he was prevailed upon to attach himself to a particular party of pleasant fellows, who remained after the house was closed, to enjoy themselves at full swing. Then it was that Talbot shone, not merely as a companion but as a performer. The change in his style and manner of playing was extraordinary: the spirit, the power, humour, and pathos which he infused into his execution, were observed by every one; and when asked to account for so remarkable a change, his reply was, "My Irish heart is warmed; I'm not now playing for money, but to please myself."

"But could you not play as well during the evening, Talbot, if you wished, as you do now?"

"No, if you were to hang me. My heart must get warmed, and Irish—I must be as I am this minute."

This, indeed, was very significant, and strongly indicative of the same genius which distinguished Neil Gow, Carolan, and other eminent musicians.

Talbot, though blind, used to employ his leisure hours in tuning and stringing pianos, organs, and mending almost every description of musical instrument that could be named. His own pipes, which he called the "grand pipes," were at least eight feet long; and for beauty of appearance, richness, and delicacy of workmanship, surpassed any thing of the kind that could be witnessed; and when considered as the production of his own hands, were indeed entitled to be ranked as an extraordinary natural curiosity. Talbot played before George IV., and appeared at most of the London theatres, where his performances were received with the most enthusiastic applause. In person, Talbot was a large portly-looking man, red-faced, and good-looking, though strongly marked by traces of the small-pox. He always wore a blue coat, fully made, with gilt buttons, and had altogether the look of what we call in Ireland a well-dressed *badagh*,* or half-sir, which means a kind of gentleman-farmer.

His pipes, indeed, were a very wonderful instrument, or rather combination of instruments, being so complicated that no one could play upon them but himself. The tones which he brought out of them might be imagined to proceed from almost every instrument in an orchestra—now resembling the sweetest and most attenuated notes of the finest Cremona violin, and again the deep and solemn diapason of the organ. Like every Irish performer of talent that we have met, he always preferred the rich old songs and airs of Ireland to every other description of music; and when lit up into the enthusiasm of his profession and his love of country, has often deplored, with tears in his sightless eyes, the inroads which modern fashion had made, and was making, upon the good old spirit of the bygone times. Nearly the last words I ever heard from his lips were highly touching, and characteristic of the man as well as the musician: "If we forget our own old music," said he, "what is there to remember in its place?"—words, alas! which are equally fraught with melancholy and truth.

The man, however, who ought to sit as the true type and representative of the Irish piper, is he whose whole life is passed among the peasantry, with the exception of an occasional elevation to the lord's hall or the squire's parlour—who is equally conversant with the Irish and English languages—has neither wife nor child, house nor home, but circulates from one village or farm-house to another, carrying mirth, amusement, and a warm welcome, with him wherever he goes, and filling the hearts of the young with happiness and delight. The true Irish piper must wear a frieze coat, corduroy breeches, grey woollen stockings, smoke tobacco, drink whisky, and take snuff; for it is absolutely necessary, from his peculiar position among the people, that he should be a walking encyclopædia of Irish social usages. And so he generally is; for to the practice and cultivation of these the simple tenor of his inoffensive life is devoted.

The most perfect specimen of this class we ever were acquainted with, was a blind man known by the name of "Piper Gaynor." His beat extended through the county of Louth, and occasionally through those of Meath and Monaghan. Gaynor was precisely such a man as I have just described, both as to dress, a knowledge of English and Irish, and a thorough feeling of all those mellow old tints, which an incipient change in the spirit of Irish society threatened even *then* to obliterate. I have said he was blind, but, unlike Talbot's, his face was smooth; and his pale placid features, while playing on his pipes, were absolutely radiant with enthusiasm and genius. He was a widower, and had won one of the fairest and most modest girls in the rich agricultural county of Louth, in spite of the competition and rivalry of many wealthy and independent suitors. But no wonder; for who could hear his magic performances without at once surrendering the whole heart and feelings to the almost preternatural influence of this miraculous enchanter? Talbot?—no, no!—after hearing Gaynor, the very remembrance of the music which proceeded from the "grand pipes" was absolutely indifferent. And yet the pipes on which he played were the meanest in appearance you could imagine, and in point of size the smallest I ever saw. It is singular, however, but no less true, that we can scarcely name a celebrated Irish piper whose pipes were not known to be small, old-looking, greasy, and marked by the stains and dinges which indicate an indulgence in the habits of convivial life.

Many a distinguished piper have we heard, but never at all any whom we could think for a moment of comparing with Gaynor. Unlike Talbot, it mattered not when or where he played; his ravishing notes were still the same, for he possessed the power of utterly abstracting his whole spirit into his music, and any body who looked upon his pale and intellectual countenance, could perceive the lights and shadows of the Irish heart flit over it, with a change and rapidity which nothing but the soul of genius could command.

Gaynor, though comparatively unknown to any kind of fame but a local one, was yet not unknown to himself. In truth, though modest, humble, and unassuming in his manners, he possessed the true pride of genius. For instance, though willing to play in a respectable farmer's house for the amusement of the family, he never could be prevailed on to play at a *common dance;* and his reasons, which I have often heard him urge, were such as exhibit the spirit and intellect of the man. "*My* music," said he, "isn't for *the feet* or *the floor*, but for *the ear* and *the heart;* you'll get plinty of *foot pipers*, but I'm none o' them."

I will now give a brief sketch of the last evening I ever spent in his society; and as some of his observations bore slightly upon Scotch music, they may probably be perused with the more interest by my Caledonian readers.

He was seated, when I entered, at the spacious hearth of a wealthy farmer in the neighbourhood, surrounded by large chests, clean settles, and an ample dresser, whose well-scoured pewter reflected the dancing blaze of a huge turf-fire. The ruddy farmer and his comely wife were placed opposite to him, their family of sons and daughters in a wide circle at a due distance, whilst behind, on the settles, were the servant men and maids, with several of the neighbours, both young and old, some sitting on chairs, and others leaning against the dresser, the tables, and the meal-chests. Within the chimney-brace depended large sides and flitches of fat bacon, and dark smoke-dried junks of hung beef; presenting altogether that sensible manifestation of abundance, which gives such a cheerful sense of solid comfort to the inmates of a substantial farmer's house.

When I made my appearance in the kitchen, he was putting a tobacco-pipe into his mouth, but held it back for a moment, and exclaimed, "I ought to know *that* foot!"—after which he extended his hand, and asked me by name how I did. He then sat a while in silence—for such were his habits—and having "sucked his *doodeen*," as they say, he began to blow his bellows, and played *Scots wha hae*. When he had finished it, "Well, I observed, what a fine piece of martial music that is!"

"No, no," he replied, shaking his head, "there's more tears than blood in it. It's too sorrowful for war; play it as you will, it's not the thing to *rise* the heart, but to sink it."

"But what do you think, Gaynor, of the Scotch music in general?"

"Would you have me to spake ill of my own?" he replied, with a smile; "sure, they had it from uz."

"Well, even so; they have not made a bad use of it."

"God knows, they haven't," he replied; "the Scotch airs—many o' them—*is the very breath of the heart itself.*"

Even then I was much struck with the force of this expression; but I was too young fully to perceive either its truth or beauty. The conversation then became general, and he addressed himself with a great deal of *naïveté* to the youngsters, who began to banter him on the subject of a second wife.

"How can *dark* men choose a wife, Mr Gaynor?"

"God, avourneen, makes up in one sense what they want in another. 'Tis the ear, 'tis the ear!" continued he, with apparent emotion; "that's what will never desave you. It did not desave *me*, an' it never will desave any body—no, indeed!"

"Why, how do you prove that, Ned?"

"It isn't the song," continued Ned; "no, nor the laugh; for I *knewn* them that could sing like angels, and, to all appearance, were merry enough too, an' God forgive them, there was little but bittherness in them after all: but it's the every-day voice, aisy and natural; if there's sweetness in *that*, you may depind there's music in the heart it comes from; so that, as I said, childre, it's the ear that judges."

This, coming from a man who had not his sight, was, indeed, very characteristic; and we certainly believe that the observation contains a great deal of moral truth—at least Shakspeare was certainly of the same opinion.

* *Badagh* signifies a churl, and was originally applied as a word of offence to the English settlers. The offensive meaning, however, is not now *always* attached to it, although it often is.

"Now, childre," said he, "hadn't we betther have a dance, and afther that I'll play all your favourites. So now, childre, trim your heels for a dance. What's the world good for, if we don't take it aisy?"

After playing the old bard's exquisite air, the youngsters, myself among the rest, joined in the dance. The punch being then introduced, a happy night was spent in chat, music, rich old legends, and traditions, principally furnished by Gaynor himself; who, in addition to his many social and amusing qualities, possessed in a high degree the free and fluent powers peculiar to the old Irish senachie.

Such is a very feeble and imperfect sketch of the Irish piper, a character whom his countrymen love and respect, and in every instance treat with the kindness and cordiality due to a relation. Indeed, the musicians of Ireland are as harmless and inoffensive a class of persons as ever existed; and there can be no greater proof of this than the very striking fact, that, in the criminal statistics of the country, the name of an Irish piper or fiddler, &c., has scarcely, if ever, been known to appear.

Perhaps, in future numbers, I may endeavour to give some of the fine old legends which, in my early life, I heard from Gaynor's lips. If I do, they shall at least have the advantage of being authentic as to locality, as well as in fidelity to the circumstances and facts of the tradition which hands them down.

THE DAUGHTERS OF ENGLAND.

The proper place of women in society, the education requisite for them, and the occupations which best suit their powers and position, form subjects of inquiry confessedly increasing every day in interest and importance. Female poets, lecturers, and politicians, are now becoming quite ordinary characters in the civilised world; and the question is, whether this is to be regarded as matter for gratulation or for regret. On this point great diversities of opinion exist. It is well, at least, that it should be fully and fairly discussed. In a new volume entitled "The Daughters of England,"* from the pen of Mrs Ellis, authoress of "The Women of England," and other popular works, we have the subject treated in most of its bearings, as is partly indicated by the headings of her chapters —"Economy of Time," "Cleverness, Learning, Knowledge," "Music, Painting, Poetry," "Beauty, Health, and Temper," &c.

Alluding, of course, to women generally, and not to individuals, Mrs Ellis believes, what some of her more ambitious sisters do not believe, that the sex has a sphere of duty and action peculiarly its own. Interpreting the word *love* in a general and wide sense, she lays down the axiom that "to *love* is woman's *duty* —to *be beloved* her *reward*." At the same time, her standard of female amiability is a very high one, involving the possession of many qualities both of head and heart. The love of distinction, merely for its own sake, Mrs Ellis conceives, can seldom lead, in the case of woman, to the great end of life—happiness. We find her expressing herself strongly on the subject of female authorship, as if it were inconsistent with feminine delicacy, and attended with the unavoidable effect of separating a female from her own proper sphere in society; yet we cannot see how there should be any impropriety in a lady employing her pen in a moral and instructive literature, any more than in her exerting herself in any other walk of industry consistent with a modest course of life. We think we could point to a few instances in which ladies practise literature without any deterioration of their character as ornaments of the domestic circle; and we have little doubt that the present authoress is of their class.

Mrs Ellis unavoidably devotes a large share of attention to accomplishments, and we are glad to find her advocating the propriety of a few of these being sacrificed for the sake of solid and useful knowledge. Regarding science, our authoress says—"Women are too much accustomed to look at the animal, vegetable, and mineral kingdoms, with eyes that may almost literally be said not to see. An insect is to them a little troublesome thing, which flies or creeps; a flower is a petty ornament, with a sweet perfume; and a mine of coal or copper, something which they read about in their geography, as belonging to Newcastle or Wales. I do not say that their actual knowledge is thus limited; but that they are too much in the habit of regarding these portions of the creation as such, and no more.

Chemistry, too, is apt to be considered by young women as far too elaborate and masculine a study to engage their attention; and thus they are satisfied not only to go on through life unacquainted with those wonderful combinations and properties, which in some of the most familiar things would throw light upon their real nature and proper use, but also to remain unenlightened in that noblest school of knowledge, which teaches the sublime truth, that the wonder-working power of God has been employed upon all the familiar as well as the astonishing objects we perceive, and that the same power continues to be exemplified in their perpetual creation, their order, adaptation, and use.

Chiefly, however, would I recommend to the attention of youth, an intimate acquaintance with the nature and habits of the animal world. Here we may find a source of rational and delightful interest, which can never fail us, so long as a bird is heard to sing upon the trees, or a butterfly is seen to sport among the flowers.

I will not go the length of recommending to my young countrywomen to become collectors, either of animals or of insects; because, as in the case of translations from the best of ancient writers, this has already been done for them, better than they are likely to do it for themselves; and because I am not quite sure, that simply for own our amusement, and without any reference to serving the purpose of science, we have a right to make even a beetle struggle to death upon the point of a pin, or to crowd together boxes full of living creatures, who, in the agony of their pent-up sufferings, devour and destroy one another.

Happily for us, there are ably-written books on these subjects, from which we can learn more than from our own observation, and museums accessible to all, where different specimens of insects and other animals are so arranged as materially to assist in understanding their nature and classification; and far more congenial it surely must be to the heart and mind of woman, to read all which able and enlightened men have told us of this world of wonder, and then to go forth into the fields, and see the busy and beautiful creatures by which it is inhabited, sporting in the joyous freedom of nature, unharmed, and unsuspicious of harm. Yes, there is an acquaintance with the animal creation, which might be cultivated, so as to do good to the heart both of the child and the philosopher—an acquaintance which seems to absolve these helpless creatures from the curse of estrangement from their sovereign, man—an acquaintance which brings them near to us in all their natural peculiarities, their amazing instincts, and in the voiceless and otherwise unintelligible secrets of their mysterious existence."

Mrs Ellis then goes on eloquently to show how much pleasure is of necessity added to existence by even such a slight acquaintance with the sciences of natural history, botany, and geology, as enables one to recognise the commonest insects, flowers, and stones. In walking, the sight of these seems like the sight of familiar friends. Nor are public questions to be wholly overlooked by women, in Mrs Ellis's opinion. "I am perfectly aware that there are intricate questions brought before our senate, which it may require a masculine order of intellect fully to understand. But there are others which may and ought to engage the attention of every female mind, such as the extinction of slavery, the abolition of war in general, cruelty to animals, the punishment of death, temperance, and many more, on which neither to know nor to feel is almost equally disgraceful. I must again observe, it is by no means necessary that we should *talk much* on these subjects, even if we do understand them; but to listen attentively, and with real interest, when they are discussed by able and liberal-minded men, is an easy and agreeable method of enlarging our stock of valuable knowledge; and, by doing this when we are young, we shall go on with the tide of public events, so as to render ourselves intelligent companions in old age; and when the bloom of youth is gone, and even animal spirits decline, we shall have our conversation left, for the entertainment and the benefit of our friends."

Mrs Ellis has a chapter on Selfishness, the chief form of which in women is, according to her, "a habit of making self at once the centre and limit of every consideration, which habit is far from being incompatible with liberality in giving." With the following remarks we fully concur:—"It is highly important to begin early to think much of others, and to think of them kindly. We are all, when young, and especially those who believe themselves gifted with more than ordinary talent, tempted to think it both amusing and clever to find out the faults of others; and amongst the busy, the meddling, and the maliciously disposed, this habit does often unquestionably afford a more than lawful degree of amusement; while to her by whom it is indulged, it invariably proves in the end most destructive to genuine cheerfulness, good humour, and peace of mind; because its own nature being offensive, it raises up against her a host of enemies, by whom all that is wrong in her character is magnified, and all that is good is evil spoken of. At the same time, she will also find that this seeming cleverness is shared with the most vulgar-minded persons of both sexes and of every grade in society, because none are so low as to be incapable of seeing the faults of their neighbours.

Could such young satirists be convinced how much real enjoyment they sacrifice for the sake of awakening a momentary interest in their conversation, they would surely pause before the habit should have become so far confirmed, as to have repelled their nearest friends, and set them apart from all the social sympathies and sweet charities of life; for such is inevitably the consequence of persevering indulgence in this habit, but especially with such as possess no real talent for amusing satire, and who, in their futile attempts to attain the unenviable distinction of being satirical, ascend no farther than to acquire a habit of speaking spitefully. It is almost needless to say, that such women are seldom loved, and seldom sought, in cases where a sympathising friend or kind assistant is required. When such individuals are overtaken by affliction, they then feel how different a thing it is to have wounded and repelled, from what it is to have soothed and conciliated. Happy for them if they begin to feel this before it is too late."

Our authoress then traces some sad consequences from this "habit of trying to be striking and amusing in company, so that self may, by that means, be made an object of greater importance. In comparison," she adds, "with such behaviour, how beautiful is that of the simple-hearted young woman, who can be so absorbed in the conversation of others, as to forget that she has taken no part in it herself; but more especially admirable is the conduct of her, who looks only or chiefly for what is to be loved and commended in others, and who, though not insensible to the darker side of human nature, draws over it the veil of charity, because she considers all her fellow-creatures as heirs to the same sufferings and infirmities which she endures, yet as children of the same heavenly Father, and subject with herself to the same dispensation of mercy and forgiveness.

The habit of thinking perpetually of self is always accompanied by its just and necessary punishment—a more than ordinary share of wounded feeling. The reason is a very obvious one—that persons whose thoughts are usually thus engaged, are apt to suppose themselves the subject of general observation, and scarcely can a whisper be heard in the same room, but they immediately settle it in their own minds that they are the subject of injurious remark. They are also keenly alive to every slight—such as not being known or noticed when they are met, not being invited to visit their friends, and a thousand other acts of omission, which an unselfish disposition would kindly attribute to some other cause than intentional disrespect.

It is the result of selfishness, too, when we are so unreasonable as to expect that every body should love us; or when we are piqued and irritated when convinced that some, upon whom we have but little claim, do not. Surely so unfair a demand upon the goodwill of society might be cured by asking, Do we love every body, do justice to every body, and deserve to be loved by every body? For, until this is the case, what title have we to universal affection? It might also tend, in some degree, to equalise the balance of requirement in favour of self, if we would recollect that the faults we most dislike in others may all the while be less offensive to us than ours are to them; and that not only for all the actual faults, but even for the objectionable peculiarities which society puts up with in us, we owe a repayment, which can only be made in kindness and forbearance to others.

In the manners and appearance of persons accustomed to dwell much upon the slights they are subject to, and the injuries they receive from others, there is a restless uneasiness, and a tendency to groundless suspicion, as much at variance with peace of mind as with that charity which 'thinketh no evil.' Compare with such a state of mind and feeling the sunny calm which lives ever in the countenance of her who is at peace with all the human race; who finds in all, even the most humble, something either to admire or love; and who esteems whatever kindness she receives from others as more than her own merits would have entitled her to expect; and we see at once the advantage she enjoys over those with whom self is the subject of paramount interest."

We conclude with a few remarkably good observations on a point which we do not recollect ever before seeing treated:—"In order to act out the principles of integrity in all their dignity and all their purity, it is highly important that young women should begin in early life to entertain a scrupulous delicacy with regard to incurring pecuniary obligations; and especially never to throw themselves upon the politeness of gentlemen, to pay the minutest sum in the way of procuring for them gratification or indulgence. I do not say that they may not frequently be so circumstanced, as, with the utmost propriety, to receive such kindness from near relations, or even from elderly persons; but I speak of men in general, upon whom they have not the claim of kindred; and I have observed the carelessness with which some young ladies tax the politeness, nay, the purses of gentlemen, respecting which it would be difficult to say, whether it indicated most an absence of delicate feeling or an absence of integrity.

I am aware that, in many cases, this unsatisfactory kind of obligation is most difficult to avoid, and sometimes even impossible; yet a prompt and serious effort should always be made, and made in such a way that you shall clearly be understood to have both the wish and the power to pay your own expenses. If the wish is wanting, I can have nothing to say in so humiliating a case; but if you have not the means of defraying your own charges, it is plain that you have no right to enjoy your pleasures at the expense of another. There are, however, different ways of proposing to discharge such debts; and there is sometimes a hesitancy in the alternate advance and retreat of the fair lady's purse, which would require extraordinary willingness on the part of the gentleman, were his object to obtain a repayment of his own money.

It is the same in the settlement of all other debts. Delicacy ought seldom, if ever, to form a plea for their adjustment being neglected. Indeed, few persons feel their delicacy much wounded by having the right money paid to them at the right time, or, in other words, when it is due. The same remarks will apply to all giving of commissions. Never let such affairs stand on and on, for want of a suitable opportunity

* Fisher, Son, & Co., London.

for arranging their settlement; especially, never let the payment of a debt be longer delayed because it is evidently forgotten by the party to whom it is owing."

ADVENTURE OF THE SAMMONS.

In the year 1780, while the war was still vigorously prosecuted between Great Britain and her North American colonies, a number of remarkable and painful occurrences, arising out of this unhappy dispute, took place on the borders of Canada and the revolted districts. Among these events, the following, which is abridged by a writer in the North American Review from Stone's Life of Brandt, may convey to our readers an idea of the sufferings to which a people are exposed during a period of civil war:—

"Old Mr Sammons, with three sons and one or more daughters, lived upon the old Johnson estate, which had been sequestered. Sampson Sammons, the father, was a sturdy old Whig [American], and well known to the British commander, Sir John ——, whom he often talked with about the rebellion. His sons, Frederick, Jacob, and Thomas, the youngest eighteen at the time of which we write, were much of the same mind and body; young Sampsons, knotty and fearless. Sir John ——, knowing their characters, thought he would catch them alive, and take them to Canada; so he sent his Indians out of the way, and by good management, captured the whole race early in the morning, without a blow. The old man and his boys were at once bound, and marched off in the direction of Canada, though but a little way. That night, the youngest boy, by the aid of the wife of a British officer, managed to escape; and the next morning, the father, having procured an interview with the Tory chief, read him such a lecture upon the ingratitude of thus treating one who had formerly stood by him, and upon the iniquity of his conduct generally, that he too was set free, and a span of his horses returned to him. But Frederick and Jacob were less fortunate, and were taken to the fortress of Chamblee, just within Canada, between Lake Champlain and the St Lawrence. At that post there were about seventy prisoners, and not a very strong garrison; so that the first thing to which the young Sammons made up their minds was an escape. Finding, however, their fellow-captives indisposed to do any thing for themselves, Jacob and Frederick determined to act without the rest; and, accordingly, the first time they were taken out of the fort together, to assist in some common service, they sprung from the ranks, at a concerted signal, and 'put,' as the phrase is in the west. The guards, startled, and less fleet of foot, could not catch them; and though Jacob fell and sprained his ankle, he managed, under cover of the smoke produced by the gun-shots made at them, to hide himself in a clump of bushes, which his pursuers did not think of searching. It had been agreed previously between the brothers, that, in case of separation, they were to meet at a known spot at ten o'clock at night. Jacob, the lame one, mistook the hour, and having gone to the spot and not finding his brother there, he left it, with the intention of getting as far from the fort as possible before daylight, his accident making time especially important to him. He accordingly pushed up the western bank of the Sorel river towards Lake Champlain, intending to swim it just below the lake, and then find his way along the eastern shore. Various events, however, occurred to prevent his doing this; but, after running great risk, by putting himself within the power of a Tory, whose chief excellence seems to have been the possession of a most kind and fearless wife, he was so lucky as to find a canoe, of which he took charge, and in which he made good headway towards home, until, in one of the narrow passes of Champlain, the British fortifications, on both sides, forced him to leave his vessel and take to the woods again.

He was without shoes, food, or gun, and had to find his way to Albany, through an unknown wilderness, along the Vermont shore. For four days he lived on birch-bark. Then he caught a few fish, and managed also to secure a wild duck. The fish and duck he ate raw. Thus he laboured on during ten days. His feet, meanwhile, had become so badly cut, and so intolerably sore, that he could scarce crawl, and swarms of musquitoes made every moment of rest a moment of misery. While thus wretched and worn out, he was bitten upon the calf of the leg by a rattlesnake. And what did this young hero do, then? Yield and die? Not he. With one stroke of his jack-knife he laid his leg open, producing a plenteous flow of blood, and with another slew the poisonous reptile. And then came a day or two of such experience as few meet with in this life. Sammons, worn to a skeleton, with feet ragged from wear and tear—his leg wounded, and not a soul within twenty miles to help—lay there under the log where he had been bitten, a little fire burning by him, which he had kindled by the aid of a dry fungus, living on the rattlesnake which he had slain. He ate the heart and fat first, and felt strengthened by the repast. There he lay, under that log, for three days—patient and surgeon, sick man, hunter, cook, and nurse, all in one. On the third day his snake was nearly picked to the bones, and he was too weak to fetch wood to cook the remainder. Jacob made up his mind that death could not be postponed; and, having already shown how little division of labour was needed in such cases, determined to essay one more office, and with his knife proceeded to carve his epitaph on the log by his side. But God was not far off from that brave man. He fell asleep, and strength from unknown sources flowed into his limbs. On the fourth day he rose refreshed, and having made sandals of his hat and waistcoat, proceeded to hobble on his way once more, taking with him, as stores, the unconsumed portion of his snake. That night, again, he was comforted, being assured, by some means unknown to him, that he was near fellow-men. Rising with this faith, he struggled on till the afternoon, when he reached a house and was safe. It was the 28th of June 1780. Such were the fortunes of Jacob Sammons.

His brother Frederick was less fortunate. He had made many efforts, to no purpose, to find Jacob, who, when he fell, would not permit Frederick to stop and help him, and in seeking him had run many risks. At length he crossed the Sorel; killed an ox; made some jerked beef; and for seven days travelled along the eastern shore of the Champlain without ill luck. But on the morning of the eighth day he awoke sick; a pleurisy was upon him—a fever in his veins—pain in every limb. It began to rain also, and there he lay, this other young hero, not far from his brother, who at that very moment, in that very neighbourhood, was nursing his rattlesnake bite—there he lay, knowing not that any one was near him, for three days, on the earth, in the summer rain, and his blood all on fire. For three days, we say, he lay thus helpless. On the fourth day he was better, and tried to eat a little of his beef, but it was spoiled. He managed, however, to crawl to a frog-pond near by, put aside the green coating of the pool, and drank. He caught frogs, too, and feasted, though not a Frenchman in any of his tastes probably. There he lay, for fourteen days and nights; and having resigned all hope of life, he put up his hat upon a pole, so that it might be seen from the lake. It was seen by an enemy; and he was found senseless and speechless, and carried—shame on the human creature that bore him—back to his prison again. And not to his prison only, but to its darkest dungeon; and there, for fourteen months, in utter darkness, he lay in irons—in irons so heavy and so tight, that they ate into the flesh of his legs, so that the flesh came off to the bone. And for fifty-six years afterwards—for he was living in 1837, and may be living yet—the wounds then made did not heal. The British officer, whose heart enabled him, knowingly, to do this thing, was a captain in the 32d regiment. May God have mercy upon his soul.

But Frederick's adventures were not yet ended; for neither was his captivity over, nor his spirit broken. In November 1781, he, with others, was transferred to an island above Montreal, in the rapids of the St Lawrence. There, as a first step, he organised another plot for escape, which failed, and, as a second step, jumped, with a companion, from the island into the rapids of the great river. Our hero and his comrade swam for four miles through those rapids, navigating among the sharp rocks and fearful shoals with their best skill. Landing on the north side of the St Lawrence, they fought a club battle with a village-full of Canadian Frenchmen; conquered; killed a calf; and, seizing a canoe, tried to cross to the south side of the river. They were above the rapids of the Cedars, where no canoe can live long unguided, when their paddle broke in the mid-stream; and once more destruction seemed certain. A fallen tree, in the branches of which they caught, saved them, however; and, crossing the next day below the falls, they struck into the forest to seek the Hudson. For twelve more days they toiled on, living on roots, without shoes, without clothes, without hats, and reached Schenectady at last, in a plight that made Christian men give them a wide berth."

HUMBLE ORIGIN OF EMINENT LAWYERS.

To show what may be attained by honourable and persevering industry, we quote the following passages from an article in the Dublin Monthly Magazine for January, on the subject of modern statesmen:—

"It is curious how sensitive lawyers are concerning their origin. As they grow into eminence—partly from the connexions which they form, and partly from the prejudices which they imbibe with a legal education—they become aristocratic in their inclinations, and would fain persuade people that they are of the magnates of the land. Ask a successful lawyer any question rather than '*What* was your father?' The number of persons who have risen by the law from low fortunes, to the very highest places in the state, is extraordinary. The present Attorney-General of England (Sir F. Pollock) is the son of a saddler. The shop (known to sporting characters) at Charing-Cross, now kept by the Messrs Cuff, belonged to Pollock *père*, who disposed of his business to its present proprietors. The father of Sir William Follett (Solicitor-General) still keeps a timber-yard near Exeter. Sir John Williams, of the Queen's Bench in England, is the son of a Yorkshire horse-dealer. The Chancellor of Ireland (Sugden) is the son of a barber. It is only fair to say, that this profound lawyer glories in his origin. At the Cambridge election, when Lord Mounteagle beat him by a majority of twenty-eight, Sir Edward was assailed, while speaking from the hustings, with a cry from a Whig snarler, of 'Off! off! you barber's son!' Sir Edward, not at all disconcerted, said at once, 'The difference between the person who thus assails me and myself is simply this—had he been born the son of a barber, he would have remained in the same condition during all his life; I was born one, and have risen from that humble sphere.' When presiding some few years since at an operative Conservative society in Lambeth, he voluntarily alluded to his origin. Sir Edward was formerly clerk to Mr Groom, the conveyancer. His admission to the bar was opposed, on the ground that he had been a clerk; and the opposition would have been successful, but for the strenuous exertions of that amiable and most learned person, the late Francis Hargrave, who contended for his admission on the ground of the candidate's ability as displayed in his legal writings. The father of Mr Platt, Queen's Counsel, one of the most eminent of the English Common-Law bar, was a clerk to the late Lord Ellenborough. Baron Gurney's mother kept a small shop for political pamphlets. Mr Petersdorff's father was a furrier. Lord Kenyon, who was successively Attorney-General (under Lord Rockingham's second administration), a Baronet, and Master of the Rolls in 1784, and in 1788 Lord Chief-Justice of the Queen's Bench (in succession to the Earl of Mansfield), and who died worth £300,000, was clerk to an attorney. Lord Hardwicke (who was Attorney-General in the thirty-fourth year of his age), was son of an attorney at Dover, who, according to some persons, was hanged for forgery. Lord Eldon was son of a coal-fitter at Newcastle-on-Tyne, and his brother (afterwards Lord Stowell) borrowed forty pounds in order to enable him to go his first circuit. Lord Tenterden's father was a barber at Canterbury. Lord Langdale was formerly an accoucheur. Lord Campbell, and Serjeants Talfourd and Spankie, were formerly reporters on the Morning Chronicle."

THE ROMANCE OF EMIGRATION.

About three weeks since, a pretty and interesting young woman, with two fine children, of the ages of one and three years, called at the office of our city clerk, inquiring for the mayor. That officer was absent, but her sorrowful demeanour spoke so affectingly in her behalf, and although evidently in humble life, she seemed so intelligent and unassuming in her distress, that Mr Lacy, the clerk, was led to ask the cause of her trouble, when she told him her brief story. Her husband, she said, was named Evans, and left his native place, Brecknock, in Wales, a year ago, to seek a new home for his family in America, leaving them to follow when he should have found the desired spot, and earned the means to enable them to make the journey. He finally settled at Oakhill, Jackson County, in the southern part of the state of Ohio, where he worked industriously at his trade, that of a tailor, until he had laid by thirty dollars for the passage-money of his family. This amount he enclosed to his wife, with directions as to the best route to reach her destination, which would be *via* Liverpool and New York. She accordingly bade adieu to her birthplace, and started on her lone and distant voyage, cheered by the prospect of soon joining her husband in their new western home. On arriving at the nearest seaport on the coast, she was persuaded by the mercenary captain of a trading vessel that it would be much easier to go by way of Quebec, whither he was bound, and she therefore took passage with him. It was two long months before the tardy craft reached port; and during this time, her stock having been exhausted, she was compelled to purchase from the captain, at his own rates, a supply for the wants of herself and her children. The extortion to which her inexperience made her an easy prey, and the increased expenses of the inconvenient route she had ignorantly taken, left her without a shilling on her arrival at Buffalo. She was still five hundred miles from her journey's end, without a friend or acquaintance, truly a helpless stranger in a strange land, with her little children looking up to her for food. The energies of a woman's nature, so strikingly developed by necessity, did not leave her to despair. She obtained shelter for herself and her children in a cellar-room in the Trowbridge block, for which she had to pay five shillings a-week, and succeeded in procuring a little sewing from a clothing shop, which barely realised as much money as paid for their gloomy lodging and coarse and scanty fare. She wrote a letter to her husband, informing him of their arrival and destitute situation; but weeks wore away in cruel suspense, while she wrote again and again; and on the return of each post, learned, with a heavy heart, that it had brought no letter for her. At length her employer had no more work for her, and she was obliged to pledge articles of clothing to procure necessary food. This wretched resource now failed; several weeks' rent were due; and in her extremity she thought of applying to the mayor for advice and relief. The poor Welshwoman's simple statement touched the manly heart of Mr Lacy. He commenced a subscription; and Mr Williams, a countryman, a worthy mechanic residing here, with prompt philanthropy, took Mrs Evans and her little ones into his house, when a discovery that his guest was born within half a mile of the old home he left twenty years before, and the family histories she related, amply repaid the kind Welshman for his hospitality. Another honest Welshman soon cheered her with his greeting. Fifteen dollars, the sum necessary to send her to Oakhill, were soon raised, and Mrs Evans's passage was engaged on board the packet. But while hastening to redeem a shawl, which, during the preparations for the start, she recollected still lay on the pawnbroker's shelves, the boat cast off. Lamenting her disappointment, she turned round, and her husband stood before her. He had been in the city ten days in search of her; had boarded at the United States' Hotel, just over the low and squalid apartment in which his little family were staying—he comfortably lodged, and living upon the luxuries of a well-served table, while they were famishing only a few feet distant. It was a joyful meeting; the dollars were returned to the good subscribers; and the re-united and happy family took boat the next day for their western home. —*From the Buffalo Advertiser.*

ENEMY-MAKERS.

THERE are some children who seem as if they could scarcely move a step without breaking or spoiling something. Whatever of a fragile nature they lift or handle, they are sure to let fall or knock over. Whatever they attempt to do, they do ill, so that it would have been far better let alone. If introduced into a garden, their feet find it quite impossible to keep off the parterres, and their fingers to abstain from plucking the flowers. In the parlour, they are perpetually raising unearthly screams from cats and dogs, on whose toes, tails, or feelings they have trampled, or setting up younger children than themselves into squalling fits, in consequence of pinches, cuffs, and bruises which they inflict—to all appearance unconsciously. Wherever they go, their course is marked, like that of a hurricane, by the wreck and disorder which they leave behind. An ill luck seems to attend them in all positions and all circumstances, and so many and so bitter are the complaints which they give rise to, that one at length almost pities even while suffering from them.

The enemy-makers are a class a good deal like this department of the juvenile world. I would define them as persons having an unfortunate aptitude, by word and deed, to give offence to their fellow-creatures, each of whom, so offended, becomes of course a deadly foe for life. Enemy-makers are often very meritorious persons. I have known them possessed of some of the most popular of the virtues, besides being clever and amusing. In their general conduct, and even in their general manners, there may be nothing exceptionable. But all this is of no avail against the leading peculiarity. Every now and then they commit some blunder or utter some speech, which throws one of their neighbours into irreconcilable hostility. This person becomes of course a focus or centre for the diffusion of unfavourable sentiments respecting the offender. He speaks ill himself, and engages as many of his friends to do likewise as possible. Thus, a single wry word will perhaps create a score of ill-speakers. It is needless to remark how these foci will at length become so numerous, as to absorb nearly the whole of the offender's neighbours, leaving him hardly one who is willing to keep on fair terms with him.

Lately visiting a friend in the country, I was much pleased with the intelligent, I might almost say brilliant, conversation of a gentleman who was asked to meet me at dinner. It seemed to me a piece of good fortune in the place, to have residing in it a man of a character so rarely met with out of great towns. I was surprised, however, in no small degree, when, afterwards conversing with various families, to find that my praises of this gentleman were not well received. In some instances, ladies faintly assented to them with a strained politeness; in others, met them with disdainful sneers and tossings of the head. One gentleman muttered something through his teeth, and another looked black in the face and said nothing. I met the man again, and liked him still better. He came and undertook to be my conductor through the curiosities of the district. We became great friends. It was incomprehensible how so pleasant and obliging a person should be unpopular. At length, I got a key to the mystery. My new acquaintance was an enemy-maker. He had, from a strange recklessness, allowed himself on various occasions to say sore things of sundry persons. He had treated one or two foolish and officious individuals with impatience, and allowed them to know what he thought of them. One after another, his neighbours had been thus offended by him, until there were only two or three who would receive him into their houses, or meet him any where else. His various agreeable qualities had been in a great measure lost to the circle in which he resided, and himself rendered a kind of Pariah, solely in consequence of a few trivial acts and a few trivial expressions.

It is not to be supposed that the enemy-maker is necessarily an unhappy man. Some may have their moments of regret for the unpopularity into which they have fallen; but generally they are quite at their ease on the subject. This is owing to the peculiar constitution of mind by which they become enemy-makers. The enemy-maker would be described by the phrenologist as a person with large self-esteem and small love of approbation; and such is at once a just and intelligible account of the leading features of his character. Perfectly satisfied about himself, he regards not what his neighbours may think of him. But the bulk of human beings are constituted differently, being liable to conceive great offence if they are not well thought of, or are treated disrespectfully. The enemy-maker, from his own want of this feeling, does not understand or sympathise with it. Himself insensible to both its agreeable and disagreeable affections, he acts very much as if there were no such thing in nature. Hence it is that he is so liable at every turn to come disagreeably across one person or another. But this defect of feeling makes him at the same time able to endure with equanimity the consequences of his unlucky tricks. He may sometimes be surprised at a cool reception from one whom he took for a friend, and think it rather odd that he has not got an invitation from some particular family for a twelvemonth; but he is not apt to be much or long discomposed by such circumstances, every thing being made up to him by the satisfaction which he habitually feels with himself.

It is nevertheless a great misfortune to be an enemy-maker, and it would be well for any person who has a tendency to become one, to put himself on his guard against it by the means which his intellect supplies, thus bringing one part of his mental constitution to compensate for the defects of another. Let him be fully aware that, though he feels independent of the approbation of his fellow-creatures, and cannot imagine how any one should be otherwise, most are in reality otherwise, and therefore conceive great offence when this sentiment of theirs is wounded. Let it be deeply impressed upon him that, in his intercourse with other parties, the most shining qualities will fail to maintain their attachment or respect, if he does not act delicately with regard to their *amour propre*. Here the flatterer may give him a lesson, if not an example. It is daily seen that a man of many bad qualities will keep a fair place in society by making himself agreeable to every body. Just as certainly will the most worthy man fail to do so, if he has a habit of putting his neighbours ill at ease with themselves by biting and undervaluing speeches.

> "What care I how fair she be,
> If she is not fair to me?"

old Wither sings; and such is the very process of ideas which leads to the enemy-maker being so much scouted. There is nothing more common in literary circles or coteries, than to hear some writer of reputation denied every good attribute, or at least allowed the very faintest praise; the cause, when examined, proving to be that this writer has dropped a contemptuous, and probably unjust, expression respecting some favourite member of their set. A single offensive sentence blinds them to his whole merits. In like manner, I have known a first-rate wit lose all character as such with one who had laughed a thousand times at his jokes, on his happening in one unlucky moment to give way to a jest, of which that person was the subject. From that moment, what had formerly been all very lively and amusing became intolerably low and coarse. In fact, the bulk of mankind are affected in their judgments of individuals, to a very great extent, by considerations affecting themselves; and if there be one particle of uneasiness in their own hearts about any one, it is sufficient to depress a saint into a hypocrite, and a philosopher into a fool. How often is merit denied where there is no knowledge of the person whatever, merely because his circumstances excite a little envy! Much more, of course, may this disagreeable affection be excited, if a positive offence be offered. If the enemy-maker would take these things into serious consideration, and endeavour to act with some degree of caution, he might train his judgment to keep him comparatively free of trouble, notwithstanding that he remained unconscious as before of the nature of the wounds which it is his unfortunate tendency to inflict.

Enemy-making sometimes, but comparatively infrequently, arises from a certain want of self-control, rendering it impossible for the party to abstain from saying some smart thing, or acting upon some favourite plan. This is a most unfortunate variety of the tribe, for they are not necessarily insensible to the effects of their delinquencies. A joke—perhaps merely a whimsical association of a couple of words—occurs to their minds, and, though the alienation of a friend, and much consequent vexation, is the certain consequence, they can no more restrain themselves than can the sot when his fatal beverage is placed before him. They take a fancy for doing a particular thing, or following a certain course, probably of quite an indifferent nature, and, though it is sure to cause a swarm of hornets to come about their ears, they are equally incapable of abstaining from it. They always repent afterwards, but generally to little other purpose than to deepen the regret which they feel for their imprudence. To this class I would say, consider what a word or an action is. It may appear a passing thing of a moment, but yet carry the seeds of the events of future years. Let no one think a word a light or insubstantial matter. Words are things, as much as if they had the weight of lead or gold. While a word can express the ideas of one mind, and raise ideas and excite to actions in another, it can never be justly held as mere breath, as common thinkers are ready to term it. Let words, then, be used with caution. Retain an offensive one, as you would abstain from shooting a poisoned arrow at a multitude. Upon the shutting of the lips may depend the comfort of many days to come. Why, then, oh why should they, in such a case, be opened?

The late Sir Walter Scott was remarkable for the example which he held up to all men, but particularly to his literary brethren, with regard to enemy-making. In his personal conduct, and in the numerous productions of his pen, he was singularly void of offence. He was not a bitter speaker; he answered all men civilly; he bore with his bores like an angel. Then, as he himself tells us, he had early seen the absurdity of such a course as that of Dryden and Pope, who made all their inferiors their bitter enemies, in consequence of satirising them, thus exposing themselves to an incessant storm of petty malice, which could not but be a source of constant torment to them. Scott wrote despitefully of no man, and, when any silly attack was made upon him, he took no notice, but let it "hum and buzz itself asleep." By this policy, he got through

life with more kind regard from his fellow-men than ever before, perhaps, befell one who attained such eminence. We become particularly sensible how admirable his conduct was in this respect, when we contrast it with the paltry viperousnesses which some eminent literary men ever and anon allow to escape them, as if to show how compatible the best talents are with false taste and an essentially mean and vulgar nature. Enemy-makers of all kinds might be directed to study the character of Scott, as a lesson calculated to be of the greatest benefit in their peculiar case.

After all, in as far as it may be impossible to effect a complete cure of the enemy-maker, I would call for his being regarded a little more gently by the world. He is an unfortunate being, whether as naturally defective in tact or self-control. Then his unlucky escapades expose him to so much inevitable obloquy, and act so injuriously, in most instances, on his fortune. Upon the whole, he is a more fit object of pity than of blame. When any ordinary person of the world experiences a shock from an enemy-maker, let him consider what an unhappy thing it is to have a tendency to act so as to excite hostility; let him reflect how fortunate he himself is in being free from such a peculiarity; and he will be disposed not so much to resent as to forgive.

THE LIFE AND WRITINGS OF COLERIDGE.

SECOND ARTICLE.

At what precise period opium-drinking acquired a mastery over Coleridge it does not seem possible to determine, as he sedulously kept the matter secret from his friends. Mr Cottle, one of his oldest friends, did not become aware of his giving way to this habit till 1814, on which occasion he addressed to him an affectionate remonstrance, to which a reply of the most touchingly despondent character was sent by the delinquent. It was not a matter of doubt that at this period he drank from one pint a-day to two quarts of laudanum per week. On one occasion he was reported to have taken, within the twenty-four hours, one whole quart of laudanum. This exceeds the quantity taken by that literary impostor Psalmanazar, or, indeed, any other opium-consumer upon record. The following letter to Mr Wade of Bristol, dated June 1814, is most melancholy, but instructive, as evincing how absolute is the slavery of such a passion.

"Dear Sir—For I am unworthy to call any good man friend, much less you, whose hospitality and love I have abused; accept, however, my entreaties for your forgiveness and your prayers.

Conceive a poor, miserable wretch, who for many years has been attempting to beat off pain by a constant recurrence to the vice that reproduces it. Conceive a spirit in hell, employed in tracing out for others the road to that heaven from which his crimes exclude him. In short, conceive whatever is most wretched, helpless, and hopeless, and you will form as tolerable a notion of my state as it is possible for a good man to have.

I used to think the text in St James, that 'he who offended in one point, offends in all,' very harsh; but I now feel the awful, the tremendous truth of it. In the one crime of Opium, what crime have I not made myself guilty of! Ingratitude to my Maker; and to my benefactors—injustice; and *unnatural cruelty to my poor children*; self-contempt for my repeated promise—breach, nay, too often actual falsehood. After my death, I earnestly entreat that a full and unqualified narration of my wretchedness, and of its guilty cause, may be made public, that at least some little good may be effected by the direful example.

May God Almighty bless you, and have mercy on your still affectionate, and in his heart grateful,

S. T. Coleridge."

About this period he was in great distress for money, notwithstanding that his regular expenses were not great, and that several friends were generous to him, Mr De Quincey giving him a present of L.300, and Dr Fox of Bristol one of L.50, while the pension of the munificent Wedgwoods was still continued. He declares in a letter that, if he had L.200 clear in his possession, he would put himself into a private asylum for lunatics, in order to be cured of his fatal love of opium, his will being of no avail in the case. Could there be a more affecting illustration of the dismal nature of this indulgence? It is gratifying to reflect that Coleridge ultimately was emancipated from its thraldom.

In 1808, he was invited, most probably through the intervention of his friend, Sir Humphry Davy, to deliver a course of lectures, at the Royal Institution in London, on poetry and the fine arts. He received for the course 100 guineas; but he was often a delinquent upon lecture days, and it was not merely once that a whole line of the carriages of the families of the gentry were reversed in their course up Albemarle Street by the first arrived receiving the intelligence of Mr Coleridge's "sudden indisposition." Indisposition it certainly was on the lecturer's part—but not of the nature of ill health. Haply some friend had broken in upon his preparatory hours, and, in that case, it is most probable that the friend received the lecture in his own person, while the true audience were riding back disappointed to their residences. Sir Humphry Davy at this time remarked, that he feared Coleridge's want of punctuality would always prevent his emergence from difficulties. Some of the lectures actually delivered were uttered in tones so uncaptivating, and with a listlessness so repulsive to uninitiated auditors, that we cannot be surprised that the lecturer did not become a general favourite. Yet for this position, and for these subjects of criticism, there is no doubt that Coleridge was naturally better adapted than for the author's desk. It is probable that opium-drinking thus early was exercising its baneful influence upon him. We believe that a very eminent short-hand writer was employed to take down these delivered lectures, and that he found the task to be impracticable; not from incapacity for his duty, but, as he is said to have expressed it, the impossibility of catching Mr Coleridge's *flow* of words. Most other speakers he could almost precede when they had uttered half of a sentence, because practice had enabled him to form a tolerable conception of the style of the conclusion of the period. But Mr Coleridge was so unlike all other speakers, and so full of ever-startling thought, that the conclusion of his sentences was quite as novel and unexpected as the commencement

On June 1, 1809, appeared No. 1 of "The Friend." This was a single-sheet periodical, projected by our author, and published by him at Keswick when resident at Grassmere in Westmoreland. A more injudicious plan and place of publication could perhaps scarcely have been devised by the most perverse ingenuity. Its appearance was too frequently irregular as to date of publication, and its rambling character unattractive. After the publication of twenty-eight numbers, it was given up; though afterwards, in happier times, enlarged, almost rewritten, and reprinted in three volumes. In "The Friend" appeared some of Coleridge's attempts at a system of political philosophy, but in so unconnected and irregular a form as rather to perplex than enlighten as to his entire views on this subject. Both in mental and political philosophy, Coleridge has declared that his object was to overthrow the ascendancy of Locke and Paley. How far he might have succeeded in this attempt, had more auspicious circumstances fostered his endeavours, we can only conjecture; certainly the efforts he actually made fell far short of the object.

In "The Friend," Coleridge thus spoke of the improvement of the human race:—"A whole generation may appear even to sleep, or may be exasperated with rage—they that compose it tearing each other to pieces with more than brutal fury. It is enough for complacency and hope, that scattered and solitary minds are always labouring somewhere in the service of truth and virtue; and that by the sleep of the multitude the energy of the multitude may be prepared; and that by the fury of the people, the chains of the people may be broken." He proceeds to unfold the high requirements for the successful exercise of intellectual powers, and adds—"Are we then to despond—to retire from all contest—and to reconcile ourselves at once to cares without generous hope, and to efforts in which there is no more moral life than that which is found in the business and labour of the unaspiring many? No!—but if the inquiry have not been on just grounds satisfactorily answered, we may refer confidently our youth to that nature of which he deems himself an enthusiastic follower, and one who wishes to continue no less faithful and enthusiastic. We would tell him that there are paths which he has not trodden; recesses which he has not penetrated; that there is a beauty which he has not seen, a pathos which he has not felt, a sublimity to which he hath not been raised. If he have trembled because there has occasionally taken place in him a lapse of which he is conscious; if he foresee open or secret attacks, which he has had intimations that he will neither be strong enough to resist, nor watchful enough to elude, let him not hastily ascribe this weakness, this deficiency, and the painful apprehensions accompanying them, in any degree to the virtues or noble qualities with which youth by nature is furnished; but let him first be assured, before he looks about for the means of attaining the insight, the discriminating powers, and confirmed wisdom of manhood, that his soul has more to demand of the appropriate excellencies of youth than youth has yet supplied to it; that the evil under which he labours is not a superabundance of the instincts and the animating spirits of that age, but a falling short or a failure. But what can he gain from this admonition? He cannot recall past time; he cannot begin his journey afresh; he cannot untwist the links by which, in no undelightful harmony, images and sentiments are wedded in his mind. Granted that the sacred light of childhood is, and must be, for him no more than a remembrance. He may, notwithstanding, be remanded to nature; and with trustworthy hopes, founded less upon his sentient than upon his intellectual being—to nature, not as leading on insensibly to the society of reason; but to reason and will, as leading back to the wisdom of nature. A reversion, in this order accomplished, will bring reformation and timely support; and the two powers of reason and nature, thus reciprocally teacher and taught, may advance together in a track to which there is no limit."

It was in "The Friend," too, that the fine "Hymn before Sunrise in the Vale of Chamouny" was published. Of this hymn, which consists of an apostrophe to Mont Blanc, we annex the greater portion:—

"Who sank thy sunless pillars deep in earth?
Who filled thy countenance with rosy light?
Who made thee parent of perpetual streams?

And you, ye five wild torrents, fiercely glad!
Who called you forth from night and utter death,
From dark and icy caverns called you forth,
Down those precipitous black jagged rocks,
For ever shattered, and the same for ever?
Who gave you your invulnerable life,
Your strength, your speed, your fury, and your joy,
Unceasing thunder and eternal foam!
And who commanded (and the silence came)
Here let the billows stiffen and have rest!

Ye ice-falls! ye that from the mountain's brow
Adown enormous ravines slope amain—
Torrents, methinks, that heard a mighty voice,
And stopped at once amid their maddest plunge!
Motionless torrents! silent cataracts!
Who made you glorious as the gates of Heaven,
Beneath the keen full moon? Who bade the sun
Clothe you with rainbows? Who, with living flowers
Of loveliest blue, spread garlands at you feet?
God! let the torrents, like a shout of nations,
Answer; and let the ice plains echo—God!
God! sing ye meadow streams with gladsome voice!
Ye pine groves with your soft and soul-like sounds!
And they, too, have a voice, yon piles of snow,
And in their perilous fall shall thunder—God!
Ye living flowers, that skirt the eternal frost!
Ye wild goats sporting round the eagle's nest!
Ye eagles, playmates of the mountain storm!
Ye lightnings, the dread arrows of the clouds!
Ye signs and wonders of the element—
Utter forth God, and fill the hills with praise!"

In the year 1816, Coleridge published his poem entitled "Christabel," which is in fact an unfinished and unfinishable romance of a mystic nature. Of a similar character was a ballad entitled the "Ancient Mariner," published amongst his earlier poems. There is a remarkable instance of alteration in the value of literary property connected with this ballad. It appeared originally in a small volume of ballads composed in very simple language, and partly after the model of the old English ballads. Most of them, with the exception of the "Ancient Mariner," were from the pen of Mr Wordsworth. The volume was loudly assailed with a burst of ridicule, amidst which it sunk out of public notice. The publisher of these ballads in their original form, in disposing of his copyrights to the Messrs Longman, found the copyright of this volume valued at "nothing." Upon his request it was willingly returned to him at this value, and by him given to Mr Wordsworth at the same. At the present period, perhaps, no portion of Mr Wordsworth's poems have been more fully appreciated, being by numerous readers as loudly applauded as they were once derided. Moreover, the "Ancient Mariner," to the unintelligibility of which Mr Wordsworth principally attributed the failure of this volume, has now become one of the most admired of Coleridge's minor poems.

During the years 1816, 1817, and 1818, were published several of our author's works, the chief of which were, "The Statesman's Manual; or, the Bible the Best Guide to Political Skill and Foresight;" and the "Biographia Literaria," a rambling but exceedingly interesting volume, before noticed, a large portion of which is devoted to the critical development of the theory of poetic phraseology, in connexion with Mr Wordsworth's poems. In 1825, appeared "Aids to Reflection, in the Formation of a Manly Character, on the Several Grounds of Prudence, Morality, and Religion," &c. This work, which is mainly of a religious character, and based upon the author's distinctions between reason and understanding, has been more popular than might have been expected from its philosophical character. We have now the third edition in our hands, with a preface by an American gentleman, from an American edition.

The last work, we believe, published by Coleridge himself, was a small volume sent forth in 1830, "On the Constitution of the Church and State, according to the idea of each," &c.

It would appear, from the list of works that he has left as almost ready for the press, that his greatest performances were never delivered to the eyes of the public. In this list there are named four works on poetry and philosophy, "of which," says he, "I have already the *written* materials and contents, requiring

only to be put together," &c. None of these have, however, been brought forward by his friends. The greatest disappointment has been excited in reference to what he calls his "great work" upon philosophy in relation to Christianity, to the preparation of which he himself tells us that he devoted twenty years of his life, and to which he considered all his other prose writings as only preparatory. He could probably have spoken the matter of this work in his private conversations, but he had not advanced far in preparing it for the press, and it is thus lost to us. Such of his posthumous works as have already been given to the public (and they are probably all that could or should be given) consist of mere scraps, often not very intelligible, but upon the whole valuable.

Coleridge's mind was eminently projective. He *proposed* to write more works than most persons would read in a lifetime. Some of them were of vast import and labour, and a few were actually in progress; but it is quite a safe assertion that he seriously projected much more than he ever could have lived to complete at his rate of performance. In fact, he was known as a man who could never be relied upon to fulfil any engagement. When advertised to deliver lectures, he was the first to propose excuses for absence on several of the appointed days; nor could he be expected to complete his promised periodical publications, if any friend should unfortunately drop in and engage him in discourse upon the subject in hand. These circumstances, together with his unaccommodating and often offensive manners, render it not so remarkable that he was always poor, as that he found so many friends. As soon as he repulsed one of these, he seemed to gain another, in a remarkable manner, and this continued till the end of his life. Perhaps no man ever lived who might be held up so suitably as an example to be imitated in some points and shunned in others—to be admired and reprobated—loved and disregarded. That so little of what he has done, and what he has left, seems to realise, to any thing like its full extent, what is known of his powers, may prove an instructive chapter to posterity—to great equally with common minds. To the first it enforces the important truth that the highest intellectual powers, undirected by well-regulated habits of thought and action, will neither bring worldly happiness to their possessor nor secure him hereafter an enviable fame—while it tells the more humbly-gifted that a vigilant and well-directed exercise of their powers may bring them not only happiness, but secure them a place in the grateful hearts of thousands.

For the last nineteen years of Coleridge's life he lived in serenity and comfort in the house of a friend at Highgate Grove, near London, lecturing sometimes at public institutions, and writing various scraps of poetry and prose, but chiefly displaying the extraordinary powers of his mind, in a kind of self-sustained conversation, which he would pour out for hours at a time to a circle of admirers, astonishing all by the rich store of thought which he seemed to have at command. For many years before his death he was subject to acute sufferings of body and melancholy lassitude, but he contemplated his end with undisturbed serenity, and much of child-like piety. The last four lines of an epitaph which he wrote for himself are—

> "That he who many a year, with toil of breath,
> Found death in life, may here find life in death!
> Mercy for praise—to be forgiven for fame—
> He ask'd, and hoped through Christ. Do thou the same."

He expired on the 25th of July 1834, and on the 2d of August was privately buried at Highgate New Church, where a handsome marble tablet has been placed by his Highgate friends, graved with a beautiful inscription to his memory.

In the above sketch, it is obvious that we could merely permit ourselves to glance at the most generally interesting features in the life and writings of Coleridge. Any thing approaching to a detailed appreciation of Coleridge's literary character and attainments, cannot be attempted in a popular miscellany like the present. The outline of his life, which we have here presented, may indicate, in a small degree, what he attempted. But of his metaphysics, which occupied so large a share of his contemplation and conversation, it would be injudicious here to attempt an explanation. They frequently transcend our grasp, and, we really believe, not seldom transcended his own. He had no system that was definable, and no practical result that was aimed at. He has been accused, latterly, of borrowing largely from the Germans in this department, although we think somewhat unjustly, at least as to extent. We confess he borrowed the groundwork of his speculations from them—that is, the starting posts for his intellectual excursions—but this he has acknowledged.

The thread of the life of Coleridge is so indistinctly manifested by the literary remains and letters, &c., that have been published, that we have found the greatest difficulty in preserving the appearance of consecutiveness in this brief sketch. If our readers should feel a desire to know how he succeeded in bringing up and educating his family, we confess that we have been unable to discover any clue to the answer. It may, however, be unknown to some, that one son is now a judge, another a bishop, and a third a poet. The will of Coleridge is, though pleasingly affectionate, somewhat amusing, inasmuch as it is a specimen of a wordy bequeathment of next to nothing—nothing in pecuniary value. To kindred and friends he apportioned his various books and manuscripts, with a solemnity ill according with their value, except as mere testimonials of affection.

THE PLACE AND THE MARRIAGE.

ALTERED FROM A FRENCH FEUILLETON.

Four travellers occupied the interior of the diligence passing betwixt Bordeaux and Paris. The customary call of the conductor, on leaving the former place, made out their names to be M. Dufour and Mademoiselle Amenaide Dufour, M. Raymond, and M. Bernard. The first of these was a man of fifty, with the air of a respectable, wealthy, good-natured merchant, and the lady, his daughter, was a very pretty and interesting girl of eighteen. The other two were young men, seemingly about thirty years of age, and were both of them favourable specimens, in looks and manner, of the educated classes of society. After the first few moments, M. Dufour opened up a conversation, taking, with wonted stage-coach caution, the weather as his subject; and by his address to M. Bernard, it became apparent that they were acquainted. However, though the discourse grew more general and more interesting in its cast, the reader will learn more of some of the parties by an account of a conversation betwixt the two young men, when they descended for a time to relax their limbs by walking.

After offering his companion a cigar, Raymond remarked, "I am going to Paris to solicit a provincial place, which I am almost certain of obtaining. No one yet knows of the vacancy, and no one is even likely to know for some short time." The other was also so far open in speech. "I will confess to you that it is Mademoiselle Amenaide who takes me now to Paris. They are going for the Carnival and Lent amusements. I met them in the country, and, though not an accepted suitor, I have not discovered any rival as yet." "The place is lucrative, and there is little to do—six thousand francs a-year," said Raymond. "A very charming girl," continued Bernard, "with a dowry of a hundred thousand francs, and twenty thousand livres a-year in prospect." Thus did the two young men keep up the fire on both sides, until it was time to return to the vehicle and its other passengers.

It was somewhat odd that both the young men threw themselves into the corner of the diligence, and seemed alike disposed to silence after their return. The fact was, that M. Bernard was busied in mental cogitation on a point newly started to him. "A married man has need of a place, to give him consideration in the world," thought he; "and, as I am so very far below the Dufours in fortune, this place of six thousand francs a-year would help in every way to ensure me against rejection." Raymond had formerly been too much absorbed with meditations on his place to look much at Amenaide. "What a charming-looking girl!" he now said, as he glanced at her; "he is not accepted, and she really may not like him; oh! how nicely such a wife and my place would suit." The consequence of Bernard's reflections was, that he set himself with art and diligence to draw out of Raymond the particulars relative to the vacant office, and secretly noted down the whole. Raymond, on the other hand, took up what was in itself a natural and pleasing task. He applied himself to the duty of playing the courteous cavalier to Mademoiselle Dufour. He soon noticed, however, that his chances of success seemed to be small. Bernard appeared to be respected by the father, and to stand reasonably well in the graces of the daughter. Raymond's good sense also satisfied him that they were not people to change friends for mere change's sake, and that, even if Amenaide was not prepossessed, he, a stranger in Paris, would have very little chance with Bernard, who was thoroughly fitted to be their daily cicerone there.

After three days' travel, the party reached Paris, where the carnival or public masquerades, held during the holidays preceding Lent, were then in full blow. M. Dufour went to lodge in a respectable hotel. Bernard did not think it proper to go to the same abode, but accompanied Raymond to a neighbouring hotel. When they had got installed, "I hope you do not intend," says Bernard, "to spend your first days in business, in place of going about with us, and satisfying your curiosity in this new scene?" "I should like it of all things," answered Raymond; "but you must remember that my business will not allow of being deferred." "I think you said that you conceived yourself sure of some considerable advantage as to time," said Bernard; "you will take a week's amusement at least?" "I cannot," replied the other; "that would compromise all." "Two or three days, then," said Bernard; "to-morrow, at all events, M. Dufour and Amenaide count upon you to walk and dine with them." "I did not hear them say so." "They charged me with the invitation; you cannot disappoint them." Raymond, who was too easy in disposition, could not resist the wily arguments of his companion, and said, "Well, since I might disappoint others, pleasure be it for to-morrow, at least!"

On the morrow, the two young men accordingly accompanied the Dufours to the Museum. Bernard there directed them along the gallery of the Louvre; and, under the pretext of some little business, left them, recommending them to devote a quarter of an hour to each picture, "as he had often done." He was absent three hours. In that time he had seen friends, had put in operation various manœuvres, and had made applications, all as Raymond had revealed his intent to do. In the mean time, Bernard was safe as regarded Amenaide, for, though the lady seemed very little chagrined by his absence, the honest Raymond had no intention of supplanting a suitor really favoured by her. After dinner, the party went to one of the theatres. Having afterwards seen M. Dufour and his daughter home, Bernard without much difficulty induced Raymond both to visit a café-table and a masquerade-ball at the opera. The inexperienced young provincialist paid a heavy penalty for these indulgences. While his wily friend escaped uninjured, Raymond was incapable of stirring from his pillow all the following day. Of this time Bernard made the best account, stirring actively to get the vacant place for himself. Raymond recovered somewhat from his sufferings, and rose in the evening; but though his perfidious friend tried to wile him abroad by a billet in a female hand, making a fictitious appointment at the masquerade balls, the young man had the good sense to keep his chamber, that he might ensure no neglect of business on the morrow.

Next morning, accordingly, Raymond remarked to Bernard when they met, "Paris has many temptations. Hitherto I have been feeble, but now will I turn to business in reality." "Pooh!" said Bernard, afraid of a premature discovery, "what is the hurry?" "I will delay not a moment longer in making my applications." "Well, then, you must at least breakfast first, as those to whom you are going will also do; and, as I have engaged some other friends to breakfast with me this morning, come with me." Raymond saw no danger in a breakfast. However, it proved otherwise. One of the young men whom he met at the table took an occasion rudely to contradict him, and seemed desirous, in short, to fasten a quarrel upon him. Raymond was any thing but quarrelsome, yet no young man of common spirit could have borne tamely the insults given to him, and he made such retorts as brought on a challenge. According to the horrid customs of modern Paris, an immediate adjournment of the whole party to the wood of Vincennes took place, and, almost ere Raymond could reflect seriously on his position, his hand was armed against a fellow-creature. The same hand was raised mechanically by the bewildered young man, but still the aim proved deadly. His opponent fell. The others rushed up, and the instant cry of all was, "He is dead!"

"Unhappy chance!" cried Bernard; "fly, fly, Raymond! The laws are now most severe on the duellist; fly to the country instantly. I will conceal myself here in a secure retreat, and communicate with you when the danger is over." The agitated Raymond returned accordingly to his hotel, to make arrangements for flight. Here, however, he met M. Dufour, who had come to ask for him, and the poor youth told the old merchant all. "Flight is the worst step possible, my poor boy," said Dufour; "it is like owning to the whole fault. I would advise you simply to conceal yourself for a short time. You may then appear or not as things are likely to turn out." "But where can I take refuge?" said Raymond; "I know no one here." "Come with me," said the good merchant; "my own private apartment shall be your hiding-place for a day or two." Raymond was but too happy to accept of the proposition, and in the chamber of the old merchant he did find a refuge. When they were fully informed of the rude and cruel manner in which he had been hurried into the late affair, he had the satisfaction of receiving sympathy both from Amenaide and her father.

After a consultation, M. Dufour went out on the following day, to make inquiries cautiously on the subject of the duel. To his surprise, he found that neither the police, nor the newspapers, nor the public, appeared to have the slightest knowledge of any such event. Another inquiry, at his own suggestion, M. Dufour also made. This was an inquiry at the office, where Raymond had intended to apply for the provincial post which was vacant. Here the startling information met him, that for the last three days, a M. Bernard, from Bordeaux, had been actively canvassing for the post, and was likely to procure it. M. Dufour went home bewildered. He then first communicated to Raymond and Amenaide the fact of the total silence existing as to the duel. Raymond started up. "Oh! thank Heaven!" he cried; "he may have recovered—I may be no shedder of blood." When Dufour proceeded to relate what had passed at the office, however, a different feeling found its way into the young man's mind. He sat thoughtfully for a few minutes. His face flushed, and he said, "I am no murderer, but I am a dupe. Pardon me," he continued, "I cannot now disclose to *you*, at least, my suspicions." But the suspicions of both M. Dufour and Amenaide were now also aroused, and, at their pressing request, he stated that, on looking back on all that had passed—on reflecting on his communications to Bernard, on the engagements and delays which had been forced on him by the latter, and on the circumstances of the duel—he suspected that deep treachery had been practised against him. "The man who has been guilty of it shall never be my son-in-law," cried Dufour. "The man who has been guilty of it shall never call me wife," said Amenaide, with even more emphasis. Raymond looked at her, and his look called up a blush.

Raymond was so fully convinced of the perfidy of

Bernard, that he proposed to go out himself, and make inquiries. "No, my dear boy," said Dufour, "there is a possibility, though a slight one, that the duel may have been no pretext. The truth will soon come to light. For the post, let it go; it may be made up." The last words had an amazingly and mysteriously strong effect on Raymond. He remained within doors, and from the long and seemingly interesting conversations which he held with Amenaide, it is probable that he found not the time heavy on his hands. This state of things came to a close with the appearance, on the second day, of M. Bernard. His face was joyful when he met M. Dufour; that of the latter was grave.

"The affair is arranged, then?" said the old merchant. "What affair do you speak of?" asked Bernard. "The duel of Raymond, certainly," was the reply. Bernard had probably hoped that this matter, or at least the details of it, would never reach the ears of the Dufours. He coloured slightly, as he replied, "Bah! it was all nonsense—a jest which his simplicity led some wags to play off upon him. His opponent was never hurt. But see, M. Dufour; while the silly fool has run away into exile, I have been prudent enough to secure his proposed place. And now, I think I may venture to ask your daughter's hand without delay."

"And I refuse my hand," said Amenaide, entering from the open door of another room, leaning on the arm of Raymond. "You, sir, have treacherously abused this gentleman's confidence; you artfully forced his inexperience and good nature into delays to take advantage of them; and you finally conspired with accomplices to remove him from your path. It was here, happily, that he found a refuge. For what you have done you have your chosen reward. M. Raymond here receives my hand in recompense, the sole condition attached to it being that he leaves you to the punishment which your own selfishness will attach to your reflections on the subject."

ENGLISH POPULAR FESTIVALS.

GOOD FRIDAY.

Good Friday,* as the presumed anniversary of the day of the Crucifixion, has for ages been solemnly observed throughout Christian Europe, the only exceptions being in Presbyterian countries, such as Scotland. In Catholic times, the observances of the day in England were of the same character with those which are still maintained in many parts of the Continent. It is still a solemn festival of the Church of England, and the only one besides Christmas which is honoured by a general suspension of business. Strict church-of-England people abstain from any kind of animal food, even from cream to tea; such, we are informed by Boswell, was the custom of Dr Johnson.† The churches are well attended, and it is considered proper to appear there in black clothes.

The religious usages of old times were generally more remarkable for the earnestness which prompted them than for their rationality or good taste. One of those appropriate to Good Friday appears in modern eyes of an unusually grotesque character. The priests took an image of the crucifix, which they carried with doleful hymns round the altar. Then stripping the figure of its coat, they laid it down before the steps of the altar, upon Turkey carpets, and with pillows to support the head. They and the people then crept along the ground in succession towards the crucifix, where they kissed the feet of the image, with marks of the greatest tenderness and devotion, many shedding tears. This was called "Creeping to the Cross." An old book containing the ceremonials observed by the English monarchs, directs the usher to lay a carpet on this day for the king "to creepe to the crosse upon." The queen and her ladies were also to creep to the cross. On the same day, the king hallowed rings to be distributed amongst the people, as a preservative against cramp and falling sickness. This was a custom which took its rise in the supposed virtue of a ring which had been given by King Edward I. to a poor person who asked him alms for the love of St John the Evangelist, and which, having found its way to Palestine, was afterwards brought back to the king by some persons returning from that country. On account of the healing power believed to reside in it, it was kept for centuries in Westminster Abbey with great veneration; and the king was presumed to be able to impart its virtue to other rings, by means of the ceremony of consecration. These were called cramp-rings, and received and sent abroad with an implicit faith in their power to cure fits. In some parts of England, the common people are still found to put some faith in what they call cramp-rings.

Another of the strange religious rites practised on Good Friday was a representation of the burial of Christ. A figure representing the dead Christ, wrapt in grave clothes, was carried along amidst the acclamations of the people, who knelt and beat their breasts before it, and deposited in a receptacle designed to represent the sepulchre, where it was allowed to rest till Easter day. The service called *Tenebrae* [that is, darkness], which is still practised at Rome, appears to be a modification of this custom. Upon a triangular frame, fifteen candles are arranged, seven yellow ones at each side, and a white one at the top. The fourteen yellow candles represent the eleven apostles, the Virgin Mary, and the women that were with her at the crucifixion; the white one at the top represents Christ. Fourteen psalms are sung, and at the end of each one of the yellow candles is put out. Then, the light on the altar being extinguished, the white candle is taken down and hid under the altar. The putting out of the fourteen candles denotes the flight or mourning of the apostles and women, and the hiding of the white candle denotes that Christ is in the sepulchre. Then a noise is made by beating the desks and shuffling with feet, to represent the earthquake and the splitting of the rocks. In St Peter's church, on this day, the hundred lights usually kept burning on St Peter's tomb are extinguished, and an illuminated cross is suspended under the dome, where it appears as if self-supported.

Eggs and apples are curiously connected with Good Friday. A Protestant writer in Elizabeth's time notes the Popish custom of "creeping to the cross with eggs and apples." Probably they were used as offerings. Another writer, of the same age, says that the Roman Catholics, on Good Friday, "offered unto Christ egges and bacon, to be in his favour till Easter day was past." "To holde forth the cross for egges on Good Friday," occurs among the Catholic customs censured by John Ball, a Protestant writer, in 1554. A French writer of a later age speaks of a custom of preserving all eggs laid on Good Friday, as good for extinguishing fires into which they may be thrown. In England, no kind of eatable but one, soon to be adverted to, remains in association with the day. We find that, in the time of the civil war, the puritan severity relaxed itself on this day upon a principle of contradiction. A "zealous brother" is thus described in 1631:—"He is an Antipos to all churchgovernment; when she fasts, he feasts: Good Friday is his Shrove Tuesday. He commends this notable carnal caveat to his family—Eat flesh upon days prohibited, it is good against Popery."

In old times, Good Friday was distinguished in London by a sermon preached at *Paul's Cross* (a wooden pulpit mounted on stone steps, and surmounted by a cross, which stood till the time of the civil war, in the open air, near the north-east corner of St Paul's Cathedral). The sermon was generally on the subject of Christ's passion. Connected with it, two or three others were preached on Monday, Tuesday, and Wednesday, in Easter week, at the Spital in Spitalfields, where the Lord Mayor and all the most eminent persons in London generally attended. The "Spital sermons" are still kept up, but take place in St Bride's Church.

The eatable above alluded to is the famous Hot Cross Bun. All England still eats hot cross buns on Good Friday. These are small cakes, slightly spiced, sometimes of a round shape, and sometimes long and tapering at both ends, but always marked on the top with an indentation in the form of a cross. In London, as well as in almost every other considerable town in England, the first sound heard on the morning of Good Friday is the cry of "Hot Cross Buns!" uttered by great numbers of people of an humble order, who parade the streets with baskets containing a plentiful stock of the article, wrapped up in flannel and linen to keep it warm. The cry, which is rather musical, is strictly—

> Hot cross buns—
> One a-penny, buns—two a-penny, buns;
> One a-penny, two a-penny—hot cross buns!

Hucksters of all kinds, and many persons who attempt no traffic at any other time, enter into the business of supplying buns on Good Friday morning. They make a stir on the streets, which lasts till church time, and it is resumed in the afternoon. About a century ago, there was a baker's shop at Chelsea, so famous for its manufacture of excellent buns, that crowds of waiting customers clustered under its porch during a great part of the day. The buns were brought up from the oven on small black tin trays, and so given out to the people. The king himself had stopped at the door to purchase hot cross buns, and hence the shop took the name of the Royal Bun-House. As always happens in London when any thing original and successful is struck out, the royal bun-house soon obtained a rival, and was obliged to advertise as the Old Original Royal Bun-House. The wars of these two houses, like those of York and Lancaster, have long since been hushed to rest, and we find it stated in a recent work* that neither of them is now distinguished for this article above the other bakers' shops of Chelsea.

Hot cross buns appear to be identical with the small consecrated loaves which are distributed by the church in Catholic countries to those who, from any impediment, could not obtain the host. These loaves are made of the dough whence the host is taken, are marked with a cross, and are kissed before they are eaten. It is remarkable that the bread of the Greeks was marked by a cross on the upper surface, and that they gave such loaves as offerings to the gods, under a name which in the accusative case is βουν (boun). The prophet Jeremiah also speaks of cakes used in Pagan worship. Two small loaves, marked with a cross on the top, were found in Herculaneum.

EASTER SUNDAY.

Easter (from the Saxon *oster*, rising, referring to the Resurrection) is observed with much ceremonial, not only throughout Catholic Europe, and in the countries where the Greek church is established, but in Turkey and the Mahommedan countries along the coast of Africa. The festival is an engraftment upon the Jewish Passover, the name of which (*pascha*) is still applied to it in almost every country besides England. The Catholic observances of Easter are of an elaborate character. At Rome, the Pope is carried in state to perform high mass in St Peter's, from the balcony of which he afterwards blesses the people assembled in the piazza below—perhaps one of the most imposing religious spectacles which the world any where presents. In England, before the Reformation, the Catholic observances of Easter were as fully enacted as in any other country. Early in the morning, a sort of theatrical representation of the Resurrection was performed in the churches, the priests coming to the little sepulchre where, on Good Friday, they had deposited the host, which they now brought forth with great rejoicings, as emblematical of the rising of the Saviour. In the course of the day, the clergy had a game at ball in the church, a custom of which it is now difficult to believe that it ever could have existed. A ball being brought in, the dean began a chant suited to Easter day, and then, taking the ball in his left hand, commenced a dance to the tune, others of the priests dancing round, hand in hand. At intervals, the ball was handed or tossed by the dean to each of the choristers, the organ playing music appropriate to their various antics, until it was time to give over, and retire to take refreshment.

At present, in large seats of population, Easter Sunday is distinguished by little besides the few peculiarities of the service, and the custom of going to church in attire as gay as possible. But in rural districts there still exist a few vestiges of old superstitions and customs connected with the day. It was once a general belief, and probably still is so in a few out-of-the-way places, that on Easter morning the sun danced or played immediately after his rising. People rose early and went into the fields to see this supposed phenomenon. Suckling, in his ballad on a wedding, alludes to it—

> "But, Dick, she dances such a way,
> No sun upon an Easter day
> Is half so fine a sight."

And Sir Thomas Browne, in denying it in his "Vulgar Errors," uses language which shows how intertwined with religious feeling the notion had become—"We shall not, I hope," says he, "disparage the resurrection of our Redeemer, if we say the sun doth not dance on Easter day." In some places, it was considered necessary, in order to realise this spectacle, to go to the brink of a fountain, and observe the reflection of the sun upon its surface, which of course would reduce the miracle to a natural fact. On Easter day, it was customary to adorn the churches with flowers, and there was in some places a custom called Clipping the Church, which was thus acted. The children came one after another to church, where they arranged themselves with their backs against the walls on the outside, taking hold of each other's hands, until so many were assembled that they formed a complete cincture round the exterior of the building—the people looking on, and shouting joyfully.

The viands appropriate to Easter day in the old times were, first and above all, eggs, then bacon, tansy pudding, and bread and cheese. The origin of the connexion of eggs with Easter is lost in the mists of remote antiquity. They are as rife this day in Russia as in England. There it is customary to go about with a quantity, and to give one to each friend one meets, saying, "Jesus Christ is risen," to which the other replies, "Yes, he is risen," or, "It is so of a truth." The Pope formerly blessed eggs to be distributed throughout the Christian world for use on Easter day. In Germany, instead of the egg itself, the people offer a print of it, with some lines inscribed. Formerly, the King of England had hundreds prepared to give to his household: in a roll of the expenses of Edward I., there occurs, in the accounts of Easter Sunday, in the eighteenth year of his reign, "Four hundred and a half of eggs, eighteenpence." The custom is supposed to have been originally Jewish.

At this day, the Easter eggs used in England are boiled hard in water containing a dye, so that they come out coloured. In some instances, this colouring is variegated or figured, by tracing over the egg with a candle end. The boys take these eggs, and make a kind of game, either by throwing them to a distance on the green sward, he who throws oftenest without breaking his eggs being the victor, or hitting them against each other in their respective hands, in which case the owner of the hardiest or last surviving egg gains the day. Even in Scotland, where holidays and holiday observances are almost unknown, *Paste* (that is, Pasch) *eggs* are regularly prepared by the boys, and thrown in the manner here described, but generally on the Saturday before Easter Sunday. When the eggs are broken, the children make a feast of the contents, keenness of digestion making up, it is to be supposed, for the hardness to which they have been boiled.

It was customary to have a gammon of bacon this day, and to eat it all up, in signification of abhorrence of Judaism. The tansy seems to have been introduced

* Good Friday occurs, this year, on the 25th of March.

† In Ireland, many of the common people eat only a crust of bread on Good Friday, and, in some places, sucking infants are withheld from their ordinary sustenance.

* Hone's Every-Day Book, i. 404.

into Easter feasts, as a successor to the bitter herbs used by the Jews at their passover. It was usually presented well sugared. Aubrey tells us that, in his time (the seventeenth century) the first dish brought upon table at Oxford on Easter Sunday was "a red herring riding away upon horseback," that is, a herring placed somewhat after the manner of a man upon horseback, in a corn salad. Throughout England, the fire was allowed to go out on Easter Sunday, after which the chimney and fireplace were completely cleaned, and the fire once more lighted.

It was a custom in the thirteenth century to seize all ecclesiastics found walking abroad between Easter and Pentecost, and make them purchase their liberty with money. This was an acting of the seizure of the apostles after Christ's passion. We have still what appears to be a relic of this fashion in a custom which exists in various parts of England. A band of young men goes abroad, and whatever female they meet they take hold of her, and pull off her shoes, which are only returned to her upon her paying some trifling forfeit. In Durham, it is done by boys, who, on meeting any woman, accost her with, "Pay for your shoes, if you please." The trifling sums which they thus collect are spent in a feast at night. At Ripon, celebrated for its manufacture of spurs, travellers riding through the town are stripped of those articles, which in like manner they have to redeem. On Easter Monday, the women make a return by going abroad in groups, and causing the men to redeem their shoes.

"Lifting at Easter" is another old custom, which may be presumed to have originated in a design of dramatising the events connected with Christ's passion. It consisted in hoisting individuals up into the air, either in a chair or otherwise, until they relieved themselves by a forfeit. A curious record makes us aware that, on Easter day, in the eighteenth year of the reign of Edward I., seven ladies of the queen's household went into the king's chamber, and *lifted him*, for which fourteen pounds appears to have been disbursed as a forfeit. The men lifted the women on Easter Monday, and the women claimed the privilege of lifting the men on the ensuing day. Three hoists were always given, attended by loud huzzas. A gentleman named Loggan thus described the ceremony, as performed in his own case in 1799:—"I was sitting alone last Easter Tuesday, at breakfast in the Talbot in Shrewsbury, when I was surprised by the entrance of all the female servants of the house handing in an arm-chair, lined with white, and decorated with ribbons and favours of different colours. I asked them what they wanted. Their answer was, they came to *heave* me. It was the custom of the place on that morning, and they hoped I would take a seat in their chair. It was impossible not to comply with a request very modestly made, and to a set of nymphs in their best apparel, and several of them under twenty. I wished to see all the ceremony, and seated myself accordingly. The group then lifted me from the ground, turned the chair about, and I had the felicity of a salute from each. I told them I supposed there was a fee due upon the occasion, and was answered in the affirmative; and having satisfied the damsels in this respect, they withdrew to *heave* others."

LETTERS FROM A LADY IN LONDON TO HER NIECE IN THE COUNTRY.

THE TOWER.

My dear Jane,—In my last letter I mentioned some of those places which appeared to me particularly interesting in passing through the city; and now I wish to conduct you along with me on a visit to the Tower, a large government establishment on the bank of the Thames, at some distance eastward from London Bridge, and in the midst of that great line of wharfs and shipping which distinguish this as the commercial end of the town.

On emerging from some confined streets, and descending a little towards the river, we come upon an open space called Tower-hill, in the midst of which the Tower is situated, on the north bank of the Thames, from which it is separated by a broad platform or quay, communicating with thoroughfares leading past each end of the building. A moat or ditch surrounds the entire area, which comprehends a space of upwards of 12 acres; the ditch measuring nearly 140 yards in circumference, and in some parts extending to the width of nearly 50 yards. The appearance of this moat, at the time of my visit, forcibly convinced me of the state of desuetude to which this once formidable place of defence had been reduced, by the happy and peaceful times in which we live; but I fancied that an enemy would still find it a fearful slough of despond, being a deposit of mud, &c., left by the evaporation of the water; but by opening sluices in connexion with the river, the water can be supplied at a minute's notice. Crossing this moat by a stone bridge, we entered through four different gates on the west side, this being the principal entrance; and instead of *a tower*, I imagined myself entering a small fortified town, so spacious are the walks and so numerous the houses all around.

The principal object in the vast cluster of buildings is the White Tower or Keep, a large edifice of a square form, 115 feet long by 96 feet in width, and upwards of 90 feet in height, consisting of three distinct storeys, surmounted by battlements, and each corner finished by a round tower and vane.

The White Tower was originally built by William the Conqueror about 1078, and was, for several centuries subsequent to its erection, used, along with some other buildings now pulled down, as a royal residence—the unsettled state of the nation rendering security indispensable for crowned heads; and even with such precautions as were resorted to for protection, the said heads were not always allowed to repose on the shoulders of their kingly owners. How little, my dear Jane, are we, who live in blessed peaceful times, able to estimate the amount of human suffering, physical and mental, which has been endured within these walls! How many of the wise and good, of the gay and beautiful, have been here confounded with the actually vicious, terminating perhaps years of hopeless imprisonment by violent disgraceful deaths or by secret assassination!

The apartments appropriated to the use of state criminals are principally confined to this quadrangular building; and here, in 1305, William Wallace was imprisoned previous to his execution. In the following reign, David of Scotland and several lords of his court were confined here; followed, in 1359, John King of France and his son. From that period the Tower was the scene of many of those dark tragedies consequent on the struggles amongst the various branches of the Plantagenet family for the supreme power. A gloomy, long-arched gateway thrown across the walk which leads to the inner ward or court, is called the entrance to the *Bloody Tower;* and in a room over this entrance it is said the young princes Edward V. and his brother, the Duke of York, were murdered; but this cannot be authenticated. However, at the bottom of a staircase which leads into this arch, a quantity of human bones were found in the time of Charles II., who had them collected, placed in an urn, and deposited in Westminster Abbey, under the impression that they were the remains of those hapless children.

Anne Boleyn, Lady Jane Grey, and her equally unfortunate husband; Sir Thomas More, and Sir Walter Raleigh; were successively sacrificed here, besides many victims, more or less distinguished, if not in their lives, at least by the manner of their deaths. Queen Elizabeth, before she acceded to the throne, and while she was an object of dread to her sister Mary, suffered imprisonment in one of the towers. The council-chamber and chapel, and several of the apartments, are now used as offices for records and state-papers; but none of these rooms, nor those formerly occupied by prisoners, are now shown. Queen Elizabeth's apartment is now the governor's wine-cellar.

Visiters wishing to be shown through the various places open for inspection, must make their way to a kind of office or chamber guarded by yeomen in scarlet-laced coats; and here they wait until a certain number assemble, when, escorted by one of the yeomen as a guide, they are conducted first to the Horse Armoury, which I was surprised to find a comparatively recent erection, though close under the White Tower. It may be described as a museum of ancient arms and armour, in which character it throws a light on the middle periods of English history. Formerly, the ideas that prevailed about armour were very confused. A painter forty years ago, representing a Norman knight of the army of William the Conqueror, would have clad him in plates of steel, though no such thing existed for ages after. A hundred years ago, Dutch painters, depicting scenes in the life of Christ, thought it quite proper to invest the Roman soldiers of Herod in the armour of the sixteenth century. All this is now reformed, in consequence of careful inquiries into the history of armour, a branch of antiquarian knowledge in which there is none more eminent than Dr Meyrick, who has published a splendid work on the subject. Now, you must understand that the armour in the Tower was till lately arranged without the least regard to historical truth. Figures of certain kings were made up in armour which did not perhaps exist for a hundred years after their time. A few years ago, Dr Meyrick gratuitously undertook to arrange it correctly, so that it now illustrates our history with some degree of distinctness. Imagine an apartment a hundred and fifty feet in length and between thirty and forty feet in breadth, with a division down the centre, formed by graceful Gothic arches or stalls, divided each from the other by a single pillar. Each of these stalls is occupied by a mailed figure on horseback, representing several of the kings of England in the costumes of the respective periods of their reigns, each surmounted by a banner, bearing the name and date of the supposed figure. Amongst these chivalrous knights—twenty-two in number—are many names which occupy a conspicuous place in the records of past ages; and in contemplating the objects before me, I could not help giving way to the feeling that I was in the actual presence of those personages whose virtues or crimes had rendered them distinguished. I learned, however, that only one half of the number of suits were really worn by the parties named, the rest being a selection, arranged as nearly as possible in accordance with the known period assigned them in this collection.

The first figure is that of Edward I., bearing date 1272, and exhibiting a specimen of the chain armour which had till then been prevalent, namely, a kind of shirt composed of metal rings, capable of resisting the blow or thrust of a sword. Edward, you will remember, distinguished himself at that early period of his life in Palestine—so that, on the authority of Dr Meyrick, we may look with some confidence on this as a fair representation of the appearance of one of those strange military enthusiasts who sought to redeem the Holy Land from Pagan domination. After Edward there is a gap till the middle of the fifteenth century, by which time the plate armour or mail had come into fashion. As specimens of the armour of that age, we have, first, the imbecile Henry VI., next his overthrower Edward IV.—the first being furnished with a curious saddle of bone work, and the horses of both arrayed in housings of velvet, richly embroidered. The next in order is Henry VII. (1508), in a tilting suit of steel, enveloping the entire figure, rendering the wearer, one would suppose, invulnerable. The horse, too, is equipped in a kind of mail. He is followed by his son Henry VIII. (1509), wearing an entire suit, with breastplates, and backplates, armplates, gauntlets and braces, all inlaid with gold, and authentic as being the armour of Henry. The next is the Duke of Suffolk (1520), in a suit of plate armour; followed by the Earl of Lincoln (1535), in a suit very richly gilt.

Early in the sixteenth century, defensive armour is considered as having attained its perfection, both as to ornament and strength. There were instances in that age of battles between small but well mailed armies, which would last a long day, and be attended by scarcely any bloodshed or damage of any kind, except a vast deal of fatigue to the metal-covered knights, and perhaps a few deaths by suffocation. We thus become prepared for the elegant and very complete specimens afforded by the figures of Edward VI. (1552), the Earl of Huntingdon (1555), the Earl of Leicester (1560), Sir Harry Lee, champion of England (1570), and Elizabeth's favourite hero, the Earl of Essex (1585). After this period, armour became more ornamental, or a matter of dandyism, than useful; and such is the character of a few of the next ensuing figures, including the gentle King James himself, who, you know, is said to have been unable to bear the sight of a drawn sword. The finest specimen of this age is presented in the figure of Henry Prince of Wales (1612), son of James, in a splendid suit of highly finished mail, engraved and gilt in the most elaborate manner. He is followed by the court favourite of the period, George Duke of Buckingham (1618), in a plain suit; next to whom is Charles Prince of Wales (1620), in a rich suit of armour, engraved and gilt; this figure is that of a youth, apparently of twelve or fourteen years of age. Next to him is the Earl of Strafford; and then comes Charles again, as king (1640), in a suit of gilt armour presented to him by the city of London. He is succeeded by his son James II. (1685), whose armour is only partial, there being now little worn but breast and back plates. This is the last in the centre row; but in a recess on the opposite side of the room is another representation of Henry VIII., which, I would say, is by far the most superb figure in the room. The armour, which is said to weigh 112 lbs., was a present from the Emperor Maximilian I., on the occasion of the marriage of Henry with his first wife, Catherine of Arragon.

Near to this, in the same recess, is a small figure in a full suit of armour, said to be that of Charles Prince of Wales, when *three years old.* I presume it was necessary to accustom the body to the use and weight of mail from the period of early youth, at least occasionally, otherwise the enormous weight must have been insupportable.

In a different part of the gallery there is another equestrian figure in a suit of chain mail, said to have been worn in the time of Stephen, 1140. This is extremely curious; and from its great age, it is now almost black in appearance. But we have all this time been so much taken up with these gentlemen of the olden times, that scarcely a look has been bestowed upon the room itself, which is well worthy of notice, being decorated in the most tasteful and curious manner with weapons and arms of all sorts.

The ceiling is divided into compartments, bordered with muskets, pistols, cutlasses, pikes, &c., arranged with the utmost order and precision; the walls also are graced with similar devices, and gracefully disposed groups of ancient weapons occupy other parts of the room. We were next conducted from this by a staircase through one or two outer rooms to a part of the White Tower, where we were shown a long apartment filled with all kinds of interesting objects in the shape of weapons, instruments of torture, &c. It was exceedingly curious to notice the ingenious devices practised by mankind for the destruction or annoyance of their fellow-creatures; and I could not help feeling, that, had the same degree of labour and skill been applied in the promotion of objects of professed utility, we should have been much farther advanced in civilisation and happiness than we even now are. We had in this room an opportunity of observing the progressive improvements in arms, offensive and defensive; and could not repress astonishment at the muscular strength of our ancestors, in the facility with which they wielded swords, lances, &c., which a modern fine gentleman would fail to move. The small wicked-looking instruments of torture, called the *thumbikins*, are here shown, as also a ring for enclosing the neck, which, being moved by means of a screw, may be supposed to have produced the most exquisite torture. The block and axe used at the execution of the unhappy Anne Boleyn, are objects of painful interest, from which we gladly turn to a kind of theatrical representation of Queen Elizabeth on

horseback, in a fac-simile of the dress worn by her when she made a progress to St Paul's to return thanks for the defeat of the Spanish Armada. This dress is embroidered with tinsel beads &c., very much tarnished by time.

On the right-hand side of this room, a small dark apartment is shown, said to have been the sleeping-room of Sir Walter Raleigh; this, I suppose, is doubtful; but only a few years ago his handwriting was visible on the walls, but it has since been obliterated by whitewash.

Descending again, and passing through the Horse Armoury, we were conducted towards the Grand Storehouse, or Small Arms Armoury. This forms part of what is called the Inner Ward, which consists of rows of buildings or offices on the north and east sides of the spacious court, the White Tower conspicuously occupying the centre. The Grand Storehouse is a long brick building of handsome construction, faced with white stone, and surmounted by a clock-tower rising in the middle of the roof. Its erection was begun by James II. and completed by William III., for the purpose of storing arms available in the service.

On entering, a new scene opened up. The large apartment on the ground floor was filled with cannon, some of them of very peculiar construction; two or three pieces raised from the wreck of the Royal George attracted special notice. The wooden carriage of one of them was perfectly entire, but the cannon and the other carriages were very much decayed by their long immersion in the water. There were numerous curious pieces of ordnance, which have figured in their day; and some interesting remains of vessels—amongst others, part of Nelson's ship the *Victory*—the steering-wheel, I think.

From this we ascended by a staircase, branching off to the right and left from the first landing, to the Small Arms Armoury, a magnificent room, 354 feet long, the floor occupied from the base to the ceiling by square kind of racks, all detached one from the other with passages between, and sustaining muskets to the number of nearly 200,000; some of these were of inferior value, not having the latest improvements which have been made on fire-arms, but they were gradually undergoing repair, and a great proportion of them were in first-rate order, with percussion barrels, caps, &c. The sides and ends of this noble apartment were ornamented in all imaginable shapes and forms with every variety of weapons, forming suns, stars, scrolls, serpents, &c., arranged with as much elegance and taste as if the materials had been perfectly flexible. Opposite the door, an open space is reserved, supported on pillars, twisted round with a wreathing composed of pistols, daggers, &c., the capitals formed also of pistols, both ends standing out in relief. The centre of this space was occupied by a very beautiful piece of cannon, which our guide informed us was a present from the Pope to Napoleon, and taken from the French in the last war. This elegant piece of ordnance was of elaborate workmanship; the wheels of the carriage on which it rested represented the sun. In a glass-case near this was shown the sword-belt and sash of the late Duke of York, presented by the late king. In the staircase the greatest degree of ingenuity was exhibited; the rails and balustrades being entirely composed of fire-arms of various descriptions, and above the first landing was a splendid military device, formed with swords, cutlasses, &c.; in this the kettle-drums taken by the Duke of Marlborough at the battle of Blenheim, occupy a prominent place, as also the guns taken at Waterloo. The walls at each side were graced by two enormous stars, also made up of arms. These ornaments were all the work of Mr Stacey, queen's decorator.

The last place exhibited was the Jewel Room, where a portion of the crown jewels were deposited for security. This is called the Jewel Tower, and is on the north-east side of the inner ward. We entered by a passage to a small vaulted room, lighted with lamps, there being no access for daylight. The lamps, however, threw a strong light upon the jewels, which were placed within an iron railing. This recess was lined with crimson cloth, the background filled up with the large gold plate used at the communion, and in front of these were cups, flagons, &c., richly chased, for the same sacred purposes. The shelves were occupied by several crowns, one of which the exhibitor declared to have belonged to Anne Boleyn; but this is very doubtful. It was very small, and composed only of a rim, or fillet of gold, set with precious stones, the cap being of crimson velvet. The crown of her present majesty was the most dazzling object in this valuable collection, and was placed at one side on a revolving stand, so that it could be seen all round. It was made from the crown of George IV., which was remodelled from that of Charles II., and is certainly a brilliant composition of all that is rich and rare. The band, or circlet, is of gold, studded with gems; the front being graced by a sapphire of inestimable value, of the deepest and most intense blue, two inches long, and one inch in breadth. In the other side of the rim is the ruby worn by the King of England at the battle of Agincourt, of great size and beauty. The top of the crown is formed by four arches, covered with brilliants and pearls, the arches uniting in supporting a ball and Maltese cross, composed entirely of diamonds. The cap is of crimson velvet. On the opposite side, also on a revolving stand, is a model of the White Tower in gold, ornamented with precious stones. This was presented by the city of Exeter to one of the monarchs of England, and is used on state occasions as a salt celler, the tops of the towers opening for the reception of the salt. It is said to be worth eight thousand pounds.

The royal christening font was also here, the queen being the last royal infant christened from it, a new one having been made for the princess-royal. This was a large vessel of gold, beautifully chased. A small golden eagle, and vessel for the anointing oil, used at the coronation, were also exhibited; and in a case below, covered with glass, were the sceptres, orbs, &c., which all bear a conspicuous part on occasions of state ceremonial. Beside them lay the gold staff of Edward the Confessor, which weighs upwards of nine pounds of solid gold.

I have thought it necessary, my dear Jane, to put all that relates to the description of the Grand Storehouse and the Jewel Tower in the *past tense*, these being the places recently destroyed by fire, my visit having been only a few days previous to this sad event. The jewels, however, were removed in safety while the fire was raging, and deposited with Messrs Rundell and Bridge, in whose strong room I have since seen them. The loss of arms, by the destruction of the armoury, has been immense, amounting, it is supposed, to a quarter of a million sterling; yet, great as this is in a pecuniary point of view, I should have regretted much more the loss of the more ancient parts of the building, these possessing a value as objects of antiquity which could not be estimated by pounds, shillings, and pence. Before leaving this interesting place, we were shown an open space on the right-hand side, where executions formerly took place; and in the centre of this Anne Boleyn and many other noble personages were put to death. The traitors' gate, a low entrance, opens out on the south of the White Tower, towards the Thames. Through this gate prisoners were conveyed by water to Westminster, where their trials usually took place. I shall conclude by hoping that the trials of all such unhappy victims of cruelty, bigotry, and oppression, have passed away for ever; and that the Tower may never enjoy celebrity otherwise than in connexion with the dark and tragic scenes of past ages.

"NOTES OF A HALF-PAY IN SEARCH OF HEALTH."*

Captain Jesse, the writer of this agreeable sketchy production, tells us that he found himself at a mess-table in India, when only sixteen years of age; and that the natural result of the style of living which he there found to prevail, was two or three fevers, cholera, and ultimately a very tormenting dyspepsia, with nerves and spirits gone. Knocked up in body and mind, home he came to recruit; was recommended by a London physician to throw physic to the dogs, and amuse himself by travelling. With his wife as a companion, he travelled accordingly, and now gives the world the benefit of his observations and reflections. The captain's excursions took the direction of Greece and Russia, and, though both are now well-beaten tracks, he has contrived, by means of well-directed observation, to pick up a variety of amusing particulars. We propose to induce readers to peruse the entire work, by offering a few short extracts as a specimen of the contents.

Going to Constantinople, he could not, as an old Indian, avoid taking a bath, according to the Turkish method. "The principal Hummums in Stamboul are situated in the pipe bazaar, the entrance being on the right in going up the street; but there is nothing to indicate the approach to so large an establishment. The undressing-room, about twenty paces square, was lighted by an open lantern in the dome above; a fountain played in the centre, and fresco arabesques (though indifferently executed) gave an air of finish to the apartment. A platform, elevated about three feet from the ground, and built round the walls, was covered by loungers and divans. Though at the early hour of six in the morning, the place was full of bathers, and I soon found myself sitting next to a sedate-looking Turk, on the platform before mentioned. It was tenanted by many others, some, like myself, preparing for the operation; others, wrapped in hot linen—that on their heads being elegantly arranged like a turban—were enjoying the greatest luxury of the bath, the pipe and sherbet after it. My inability to converse I found decidedly unpleasant; however, I was soon undressed, and having thrown a cotton towel round my loins, and placed my feet in a pair of wooden pattens, not particularly comfortable, I hobbled through a small passage which led me into the murky atmosphere of the *tepidarium*. Here I saw one of the assistants rubbing down an old and bearded descendant of the prophet, with a head like that of Michael Angelo's Moses, and so motionless, that he might have been the very statue itself. No jockey ever strapped a hunter with such force; it was *a repeal of the union* between the skin and flesh, for every stroke of the hair-glove brought away a considerable portion of the former. To me this appeared a *violent measure*, but he submitted very quietly, and I entered the *caldarium* a little more reconciled to my fate. There was nothing remarkable in the room I had left, but the one I was now in struck me greatly: it was circular, and about twenty-five paces in diameter, dimly lighted by perforations in the dome above; under this was a stone platform, inclining from the centre downwards, which, as well as the pavement generally, was intersected by pieces of coloured marbles, evidently of great antiquity. On this platform the bathers, as they entered, lay down, placing a towel under their heads. Certainly there was nothing very luxurious in this couch; on it, however, they underwent the process of shampooing, a ceremony I dispensed with, having tried it many years before in India; it consists in squeezing every muscle of the body, and making every joint crack. A barber, whose assistance I required, now made his appearance; and such was the excessive perspiration, that he relieved me of my beard without the aid of soap, in a very expeditious and agreeable manner. The operation over, he and my attendant disappeared, and I was left to my own observations. These were pleasant enough, for every one appeared to be enjoying himself; and as the laugh and more subdued song were re-echoed from the lofty dome, all apprehensions regarding the hair-glove vanished.

I was now stuck up against the wall, in a recess which contained a stone basin, receiving both hot and cold water, and the assistant, aided in his operations by the hair-glove, began to remove two or three layers of what a Turk considers superfluous skin, but which I, having worn it for some thirty years, looked upon in no such light. The fellow, however, effected this excoriating process in so very humane a manner, that the most strenuous supporter of Martin's act might have stood by without the slightest annoyance to his feelings. During each pause of the glove, I was drenched with very hot water; and when it was finally laid down, I thought I was a pretty good example of a modern Marsyas. The repeated sousings which followed, got the steam up on me to such a height, that I felt it was a case of high pressure, and rushing into the adjoining room, as to a safety-valve, I threw myself down on the ground, gasping like a fish out of water. The change in the temperature soon relieved me, for though this room felt oppressive as I passed through it on my way to the one I had just left, it now felt equally cold. But the operation was not yet over, for my scrubber soon re-appeared with a pewter basin full of lather, which he laid over my person with a piece of hemp, very much like a ship's swab on a small scale: the effect was delightful after the glove, and removed all irritation. Another drenching followed; and having thus been flayed, parboiled, and steamed, half-drowned and half-suffocated, I put on dry things and retreated to a seat in the undressing-room, as quickly as my pattens would allow me. Here my hot linen was again changed, and my head wrapped in cloths, arranged, no doubt, in a turban, like those already alluded to; I was then furnished with a chibouque, and I sunk back in my fauteuil, thinking what Pipes would have given for such a bath for the gipsy. The expense of all this was seven piastres, about eighteenpence, including coffee and lemonade, both exquisite, the latter being iced. In fact, it was only when sipping them, and smoking the sultana, that I found myself in a position to be called luxurious; and I left the Hummums, though rather sore, much gratified with my visit. The Turks only pay one piastre and a half, but, the pipe excepted, without refreshment."

Captain Jesse spent a considerable time at Odessa, from which he proposed to travel through the Crimea, but was delayed and vexed in no ordinary degree by the Russian functionaries, who rule over the passport establishment. We let him describe the scenes which occurred on this occasion. "The following day I was again at my post. My papers lay duly arranged upon the table, but the man in green paid no attention to me; and though many applicants were successful, the crowd around him appeared to increase rather than diminish. I soon saw how matters stood; and feeling certain that, unless I followed the example of those who had retired, I should again be desired to 'call again to-morrow,' I put my hand in my pocket, a sign-manual which this purveyor of signatures perfectly understood, and we effected an amicable exchange. Handing me the papers, he pocketed the silver with the most perfect *sang froid*, telling me, as he dropped the 52-copeck pieces into his pocket, that 'the imperial salary would not keep him in boots.' I was now enabled to pass the sentry who guarded the entrance to the sanctum of the Chef de Police. His office, like most other public ones in Russia, consisted of four bare walls, with a brick stove reaching up to the ceiling in one corner, and was furnished with a deal table and a few chairs. Though a civil functionary I found him in full uniform, and, as usual, radiant with orders. The table was covered with papers, and in the centre stood the palladium of the place. This extraordinary affair, which is to be seen in the principal room of every public office in Russia, is made of copper or iron, gilt, and, though much larger than a Metronome, and having three sides instead of four, is not unlike one; the imperial eagle crowns the apex. On this singular instrument of office is engraved a variety of instructions, addressed to those intrusted with the administration of the laws, and suitable advice respecting the great sin of bribery and corruption. This public monitor is said to have been devised by Peter the Great, whose anxiety on the subject appears to have been well founded. The person in the present instance had accumulated a fortune that his net salary for one hundred years would never have

* London: Madden and Co. 2 vols.

amounted to. But his is not a solitary case, for the respect paid to the mute admonitions of these tablets is in form only, and that is most religiously observed. As it is the representative of the imperial power, no Russian enters the room without taking off his hat to it; the serfs carry this feeling still farther, and I have observed many of them who had accidentally caught a glimpse of it from the adjoining room, bow as low to it as they would have done to the altar. Foreigners, ignorant of the sanctity of this emblem, not unfrequently meet with sharp rebuffs for their unwitting neglect in not saluting it. I was first awakened to the necessity of so doing by a threat of having my hat knocked off.

But to return to my passport. The signature I had so long waited for was duly affixed, and I left the office, but not in possession of that document, for my three days of apparently '*pas perdus*' had merely procured me a certificate that I was not in debt, which happily I knew before. I had now to proceed to the office of the military governor, where two or three more bribes were administered, and another *triangle* or two propitiated, before I could obtain it. Then it was of no use to me as a final measure, for as I intended to travel post, I had still to present it at another office to get a *padaroshna*, or order for post-horses. There I was again obliged to show my certificate from the police that I had no debts; and two days more were consumed before I received the document which at length set me at liberty to start."

We hear much of the far-sightedness and excellence of character of Nicholas, but either he is unduly eulogised, or is kept in ignorance of the infamous treatment of travellers, of which the above is an example.

The account of a dinner-party at St Petersburg is as follows:—"My first introduction to Russian society was at a dinner-party, at the Countess T——'s. We were invited for four o'clock, the usual hour, and, on our arrival, found the party already assembled in the drawing-room; the ladies were in morning dress. A tray was shortly after brought in, with caviare, herring, and other *et ceteras*—a perfect epitome of an Italian warehouse. This was followed by another, with 'votka' (*rum*) and liqueurs; the ladies, as well as the gentlemen, partook slightly of both. Dinner was then announced, and on entering the dining-room, we found only the dessert on the table; there was nothing but the glass and plate on the sideboard. The fresh fruit and flowers had a much more pleasing effect than roast joints, fricandeaux, and curry. A slice of black bread, a white roll, and a decanter of *vin ordinaire*, were placed for each guest. The dinner was composed of the best French and English dishes, which were handed round in rotation, with wines at intervals, by free servants out of livery, well dressed and well trained. This, however, is the case only in the best houses; the generality are serfs, equipped in liveries made in the house by their fellow-slaves. These wait without either glove or napkin; and as the pump in the yard is their jug, and the trough under it their only wash-hand basin, their hands are not agreeable objects to the eye, and certainly not in keeping with the unnecessary quantity of plate and glass which is frequently displayed, or the taper and jewelled fingers of the ladies of the party. Quass was to be had if asked for; but this is avoided in company, as beer is amongst some of the *soi-disant* select in England. I have, however, seen many exceptions to this in Russia; and sometimes sat next to a countess, who regularly emptied a decanter of this execrable beverage. After dinner, it was exceedingly disagreeable—to make use of a mild term—to see every one rinsing his mouth heartily, and expectorating copiously into his finger-glass. This operation over, the conversation suddenly ceased, apparently by mutual consent; the company rose, crossed themselves, and having bowed to the noble hostess and to each other, all round the room, returned to the salon in the same order as they left it. Coffee was then brought in; and in about half an hour, almost every one had retired. While musing on this circumstance, and admiring the ingenuity with which the eight decorations of an acquaintance were arranged—for they were all suspended from a small gilt sword, similar to those sold in London under the denomination of 'Prince Albert's toothpicks'—he came up to me, and whispered in my ear, 'Captain, it is time to go.' 'Where to?' said I. 'Home,' replied my friend. 'Home! why, I did not order the carriage till ten!' 'Ah, indeed, that is unfortunate; but such is our custom, and it will be thought very odd if you remain.' In less than a quarter of an hour after this, I found my wife and self trudging home on foot, our evening costume attracting no little attention from the promenaders on the boulevard; and we regained our hotel, much amused at being, according to our habits, civilly turned out of doors. This was a good specimen of a Russian dinner, where, with the exception of the misuse of the finger-glasses, there was nothing to offend a person of the most fastidious taste. In Russia, however, polished manners, nay, even the decencies of life, are often forgotten in the violence of temper fostered by the possession of irresponsible power; and scenes sometimes occur which would not be met with at the tables or in the society of any other European country. At a large dinner-party, at which a friend of mine was present, one of the servants, in handing a wine-glass, had the misfortune to let it fall. The master of the house, a general, totally oblivious of the presence of ladies, rose from his chair, and with one blow laid the luckless offender, his serf, bleeding on the ground. A few excuses followed, as readily accepted as they were made, and the dinner proceeded as if nothing had taken place. Smoking is allowed in the most fashionable houses, the custom being somewhat qualified by the use of '*cigaritos*.' This habit even the ladies sometimes indulge in; and I was not a little astonished to see that spitting-boxes formed part of the furniture of the drawing-rooms in the imperial villa at Moscow."

Captain Jesse describes the people generally of Russia as being bigoted and superstitious in the extreme, a condition from which their ignorant and selfish priesthood have no desire to rescue them. The abasement of the serfs is likewise most distressing to contemplate. Hundreds of them, we are told, are taken from the east and central parts of Russia to the Crimea, and are there let out to hire for the benefit of their proprietors, much in the same way as hack-horses are let in England. They may also, though in an indirect manner, be sold; a sound, well-formed man will bring a thousand roubles, but a woman may be purchased for five hundred. They are likewise sometimes staked at the gaming-table; the captain says he knew of a serf who was bartered for a pointer. When serfs are skilful in the arts, they may realise large sums by their labour; but their gains are at the mercy of their owners. A serf belonging to Count H. was a clever watchmaker, and offered a large sum for his emancipation: the request was refused. "No," said the count; "pay me five hundred roubles a-year, and I will not exercise my power, but I will never part with it." Outraged humanity will one day exact a severe reckoning for these accumulated atrocities.

IRISH SERVANTS.

[The very beautiful work of Mr and Mrs Hall, descriptive of Ireland, to which we have frequently referred in terms of commendation, appears to approach its completion, preserving to the last the same interest and tasteful illustration of natural character which distinguished the early numbers. This work, it will be observed, is the product of two gifted minds—the solid and useful being the work of Mr Hall, while the interweaving of characteristic sketches, aided by a lively fancy, is the appropriate province of Mrs Hall. This lady may be said to unite the qualifications of both an English and Irishwoman—in manner English, but in heart truly, we should say *warmly*, Irish. This love of her native country extends to all connected with it; and the good qualities of her countrymen and women are a constant theme of praise, while, to do her justice, those of an opposite tendency are by no means passed over in silence. In the last published number of the work on Ireland, we have a specimen of this national attachment, in her description of Irish domestic servants, a portion of which we take the liberty of laying before our readers.]

The greater number of Irish servants employed by the middle classes are taken from the lowest and *poorest* in the country. We repeat, they are not properly fed, they are not properly lodged at night, and their wages are not in proportion to their labour—we mean even at the Irish rate of remuneration. Our hearts have ached for these poor, ignorant, but warm-hearted and affectionate creatures. We have seen the mistress of a house—perhaps an opulent tradesman's wife—such a woman as in London would give her maid-of-all-work ten or twelve pounds a-year, her tea, and either a pint of beer *daily*, or beer-money, and her nurse-maid eight pounds, with the same allowance—employing a bright-faced but half-clad girl, who had to do every thing as best she could, for *four pounds a-year*—wash, iron, cook, clean, scour, scrub, and wait upon company; and yet her mistress descanted long and loudly on the impossibility of obtaining "good servants!" Now, in England, the middle class (the class that stamps the character of a country) prepares, as it were, the servant for a higher step. The poor Irish lass has no hope of a higher step, because she has learned nothing where she has been. She is constantly obliged to make one thing do duty in half-a-dozen ways, where there is a total want of "system;" and has no idea that, unless the furnishing, cleanliness, comfort, and arrangement of a kitchen are attended to, there can be nothing well ordered throughout the house. Little or nothing is done to raise the poor servant in the scale of moral or intellectual being; no effort being made to improve her habits or her tastes, so that she looks upon the brushing and cleaning up-stairs in some degree as a work of supererogation. She does not *see* the necessity for it—she does not reason as an English servant does—"I cannot sit down to my supper till I have cleaned my kitchen." And why? Because there have been no pains taken to improve *her knowledge of the decencies of life*. We write of the habits of the middle class, and a step below them; and we say, that until they treat their servants better, and pay them better, they cannot have decent servants. Our domestic comfort, here and everywhere, depends on our servants; and surely it is worth while to consider how we can best obtain that comfort. If the money expended by careless habits in Ireland were saved by prudence, the gentleman farmer, the town tradesman, the person of limited income, would be able to pay servants, so as to induce well brought-up respectable young men and women to go to service. A servant would consider herself well paid, and would be well paid, in Ireland, who received seven or eight pounds a-year. Let her have her breakfast, her dinner *at one* (a servant's health and habits of *order* are strengthened by the system of early dining), and a third meal of plain wholesome food. Do not degrade her by supposing she would steal food like an animal. Do not treat her as a thief, *or you will make her one*. Feed her entirely without reference to "breakfast-money." There is something inexpressibly humiliating in bread being *locked up* from fellow-creatures who are labouring for you. In service, as in matrimony, there can be no "separate maintenance" without evil arising. Let the servant have her money free of her maintenance; that is one step towards establishing a better order of things. Remunerate her for her labour *honestly*. Pay her enough to enable her to be always clean and decent in appearance.

We hope these comments will not be considered dull, and, still more earnestly, that they may not be taken as offensive. The subject is one of very vital importance; and in directing attention to it, we may be the means of doing essential good to both the employer and the domestic. Unless truths are conveyed in plain and direct terms, they have usually little weight. The unselfish attachment, ready industry, willingness to labour, and fidelity, of the Irish servants, are appreciated even where their careless, unformed, and *uneducated* habits, militate against them; and it is unquestionable that a more careful training, under a better order of things, would render them infinitely more valuable auxiliaries to a household, either in Ireland or in England.

But this branch of our subject let us illustrate by an anecdote.

Mrs L. was a lady in London, who, when she advertised for a housemaid, added the very unamiable, but by no means unfrequent, "P.S. No Irish need apply." Notwithstanding, a very decent, pretty, and respectable-looking young Irishwoman did present herself in the lady's drawing-room as an applicant for the situation.

"I told you," said Mrs L. "that no Irish need apply."

"It was on the paper, I know, ma'am," answered the girl; "but I thought if I had a good character, and could do my work well, that no lady would refuse me bread because of my country." Mrs L. was a young housekeeper, and she had worded her advertisement by the advice of friends; persons who cherish a prejudice as if it were a perfection, and, forgetting altogether how frequently they have had idle, dirty, careless, and dishonest English servants, pour out the vial of their wrath upon the Irish, from whom they withhold the power of exhibiting their advantages by contrast. Fortunately for Kitty Gallagher, however, Mrs L. was considerate as well as just. She looked into the poor girl's open and honest countenance as she stood with the flush of humble indignation on her cheek, inquired carefully into her character, and examined her three or four written discharges, which of course "went for nothing," but subsequently called on two persons who had known her; and the result was her engagement.

Mrs L. was the wife of a highly-respectable mercantile man; one of a class who, of all others, entertain great mistrust of the Irish people; their methodical and business-like habits preventing them from making allowance for the volatility and heedlessness of their mercurial neighbours. Mrs L. had consequently to encounter the "astonishment" of her aquaintances, and the warnings of her husband.

With every desire to do right, and habits that were tolerably clean and very active, Kitty found she had so much to learn that she frequently cried herself to sleep; as she told us herself, it was not the hard work that overcame her—she could do ten times as much and think nothing of it—but "the particularity"—the necessity for spotless stairs and carpets, for stoves polished like mirrors, for a total absence of dust everywhere; for a manner, staid, silent, smileless, and of distant respect; for a noiseless step, and a voice never heard except in the most soft and brief reply; then the getting up fine things: she could have washed, to make like snow, tablecloths, sheets, and dresses, but the difficulties of small-plaiting and clear-starching, the very clock-like regularity of the house, "broke her heart"—there was a place for every thing, and every thing must be in its place. Then her fellow-servants would set her wrong instead of right, and sneer at her afterwards; they ridiculed her country, and wondered she could eat any thing but potatoes, like all her people. Though loving to laugh, she did not relish being laughed at, and between her desire to do well in all things, and her national sensitiveness, poor Kitty had enough to encounter during the first twelve months of her servitude. On the other hand, Mrs L. more than once fancied she had acted imprudently. Kitty was not only blamed by the other servants for what she did, but for what she did *not*: her eagerness to please frequently occasioned blunders and mistakes; her phraseology was perplexing; and her foot was not as light, nor her "manner" as fully formed, as that of a London servant. But then her habits were very inoffensive. She was ever cheerful—willing to assist in every one's work; no matter how late or how early her services were needed, she was always ready. By degrees she blundered less, and absolutely dusted both corners and skirtings without "following." Then she was so humble when reproved, so happy when praised! At first, a sort of womanly spirit prevented Mrs L. from confessing she was wrong in her judgment, and by degrees—slow, but sure degrees—Catherine established herself in her mistress's good opinion. We have observed a great number of the Irish in England, of all grades and classes. No instance has ever occurred within our knowledge where they failed in attaining their object, except by being drawn off from it to run after something else; when they really persevere, when they add to their native energy a singleness of purpose, *we never knew them fail*. Kitty, in her humble way, was evidence of this; she felt deeply grateful to her mistress for having made an exception in her favour; she had good sense enough to understand that she had bettered her condition, and to feel that in England girls "with two or three hundred a-piece" were not ashamed to go to service. She resolved to master the difficulties with which she was surrounded, and to keep her place; gradually, her good humour and good nature became appreciated. Mrs L.'s two little ones caught scarlet fever, and when the nurse declared she was afraid to remain with her charge, Kitty volunteered to take her place. "I am not afraid," she said; "and sure God can keep the sickness from me by their bedside as well as by my own; and if I was to go, His will be done! but I am not afraid." Night and day this girl watched with their

mother over the children; at her request, no stranger smoothed their pillows or aided her exertions; what she lacked in skill she made up in actual tenderness, and her quickness and attention never wearied; in time, the children recovered, but they had become so attached to their Irish nurse that they intreated their mamma to let her remain with them, and the former nurse took Kitty's place. When Kitty was a girl, there were no National Schools, and at that time she was so ignorant of "book learning" that she did not know her letters; but she managed to learn them from the children, and concealed her deficiency so well, that Mrs L. told us it was not until Catherine *could* read, that she confessed how entirely uninstructed she had been. During a period of five years, she continued in her place, unspoiled by much kindness; and frequently did her mistress boast to her acquaintances of the treasure she possessed in an Irish nurse; it was quite true that Catherine's accent was anything but correct, still her mistress declared it to be "her only fault," and one for which her fidelity and good conduct amply atoned. Love now somewhat interfered with her duties; a master carpenter paid his addresses to the kind Hibernian; her mistress was too just to prevent her settling respectably, and as her intended husband had formed an engagement to go to New York the following spring, Kitty decided on remaining with her "darlings" until within a week of his departure, when she was to exchange the guttural of "Gallagher" for the more euphonious name of Miller. Hitherto, Mr and Mrs L. had enjoyed in life uninterrupted sunshine—every thing prospered which the merchant undertook; but a few eventful months made a terrible change in their circumstances; loss followed loss with fearful rapidity, until at last their house was advertised to be sold, and Mrs L., firm and patient in adversity as she had been cheerful and considerate in prosperity, placed Kitty's quarter's wages in her hand, and told her that, for the future, she must herself attend to her children; her voice faltered as she thanked the poor Irish girl for the care and tenderness she had bestowed upon them; and she added a wish, that as the time had arrived when Kitty was to be married, she would inform her of her prospects after she and her husband had been some time in New York, and rely upon Mr L. to remember her faithfulness, if ever he had the power to serve them. We quote Mrs L.'s own words. "Catherine," she said, "stood without replying until I had done speaking. I was more agitated at parting with her than with all my other servants: she had evinced more affection towards me and mine in an hour than the others had shown in a year."

"Is it to leave you, ma'am, you want me, and to leave the young master and miss! Ah, then, what have I done, to make you think I've no heart in my bosom? I'll be no burden to you, but I'll never leave you. Leave you in your trouble? Sure, it's neither peace nor rest I'd have by day or night, to think it's my two hands you'd be wanting, and they not in it. And as to Robert Miller, it will be better for him to be by himself for the first two or three years; and so I *told him this morning when we parted.* 'I'll never leave the mistress in her trouble, Robert,' I said; 'and if it's any bar, why, I'll give you back your promise;' and he would not hear of that, but took on a good deal at first; only it's all over—time and distance are nothing to true hearts, and if he does forget me, why I'm doing my duty still. I'll never leave you in your trouble." "Her devotion, so simple, so perfectly unaffected," added Mrs L., "drew more tears from my eyes than my own sorrows. I had nerved myself for them, but this overpowered me; the children became wild with joy when they found Kitty was to remain with them; and she certainly was the good spirit of comfort in our humble cottage. But this was not all: she had saved in my service about fifteen pounds, and every farthing of this money she spent in buying in, at the auction which finished the desolation of our once happy home, such small things as she believed me most attached to; these she had conveyed to our dwelling secretly, and then, with a delicacy which must be innate, she intreated me to forgive the liberty she had taken, and endeavoured to persuade us she had but returned to us our own. I often think that my husband's proud spirit would have been bowed even to breaking, but for the true nobility of Catherine's heart; toiling as she was in all capacities for our sakes, I never saw a shadow on her brow. She was an existing proof (amid much that led us to believe the contrary) of the disinterested generosity of human nature; she taught us the value of usefulness—she made us ashamed of our prejudices, and never did she once make us feel that she had sacrificed a pin's worth to our interests."

This is no romance—it is simple and unvarnished truth; both the mistress and the servant are intimately known to us; we have not added an iota to the story as the former told it to us. Kitty's generosity of character did not effervesce; during a period of three years she remained firm to her purpose, because Mrs L. needed her services. At length a distant relative of Mr L.'s died, and as next of kin, Mr L. inherited a very comfortable property; then, indeed, Mrs L. found Kitty more than once weeping over the letters she could hardly read, but which, nevertheless, she knew by heart. It was not, however, until she had succeeded in training "a cousin of her own," whom her mistress not only consented, but was happy to receive, that Kitty performed her promise, and rewarded her lover for his constancy.

How many other examples of devoted and disinterested attachment of Irish servants to their employers we might add to this, and yet record only cases entirely within our own knowledge!

May we not hope that the prejudice against them in England, so rapidly diminishing, will be, ere long, altogether gone; and that when their advantages—of faithfulness, industry, and willingness to labour, in all ways and on all occasions—have been considered and appreciated, they will acquire those, perhaps, equally essential, habits of neatness and order, into which they have hitherto not been properly disciplined, because kept far too much away from opportunities of improvement?

THE BRITON'S FIRESIDE.

'Twere vain to seek on foreign shores the comforts of a "home,"
That name is less familiar as farther on we roam;
No other clime can boast the peace, the calm and tranquil pride,
A Briton feels when all is mirth around his fireside!

'Tis there the old forget their age, and gambol with the young,
To mingle in the merry dance, or join the social song;
Oh! if from thought thou'd'st turn away, some rankling care thou'd'st hide,
Go, imitate the Briton's lot, and learn his fireside.

Yet not alone in gayer hours this social peace is known;
It lives and blooms when all the sweets of passing mirth have flown;
Yes! there the father mildly checks the faults he cannot chide,
And chains the feelings of his child to that dear fireside!

Say, who can view the happy few, in innocence and mirth
Assembled round the very hearth which sparkled at their birth;
Who, launched upon life's troubled sea, have struggled with her tide,
And not proclaim the blessings of a Briton's fireside?

Long may the hand which guards our isle avert the luckless day,
When from her shores such happy scenes must fade and pass away!
Long still may Britons boast their peace, and feel an honest pride,
That they alone of all the earth possess a fireside!

W. H.

THE STEAM NAVIGATION OF GREAT BRITAIN.

[From the *Journal des Debats*, December 1841.]

England is increasing in an extraordinary manner her means of communication with every part of the world. On March 20, 1840, a contract was entered into between the government and the Royal Mail Steam Navigation Company, by which the latter engaged to organise a line of steam-packets between England and the Gulf of Mexico. In less than twenty months from the signing of the contract the running of these vessels has commenced.

The conditions imposed on the company were, that they should build fourteen large steamers, each of 400 horse power, and capable of carrying the heavy artillery now in use. All these vessels were to be completely found in every respect. From the time the company should be prepared to commence the running of these vessels, they were to dispatch, at equal intervals, twice in a month, a steamer, which should first carry the mail to the island of Barbadoes, and from thence into the Gulf of Mexico; and the company were bound to take measures for the landing and receiving mails at all the different points at which they were to touch, in an interval of not exceeding twenty-two days (except in case of accident) from their arrival at Barbadoes to their departure from Samana, in the island of Hayti, on their return to Europe.

The government, on its part, engaged to pay to the company an annual sum of L.240,000, payable, in equal proportions, every quarter.

Not twenty months have elapsed since this contract was signed, and already eight of those stupendous vessels, ready for sea, have assembled at Southampton, which is to be their point of departure. These vessels are said to be magnificent; and in the trial trips to which they have been submitted, have shown their amazing powers, none of them performing less than twelve knots an hour, and one of them, the Clyde, fifteen. The remaining six vessels will be at Southampton by the 15th of next month. One of these fine vessels started last week for her voyage, and will be the first vessel that has made the run between Europe and the Gulf of Mexico by steam power alone. Others will follow in regular succession.

This activity does honour to the directors of the company; but it is not only to the continent of America that the English direct their attention. In the other hemisphere they evince no less efforts to unite their Indian possessions with England by means of rapid and regular communications. The port of Bombay has become one of the most important points of the globe for steam navigation. Her steamers regularly ply to the mouths of the Indus, the Persian Gulf, the Red Sea, and Suez, where they every month transport the correspondence from India, China, and the Indian Archipelago, carrying back in exchange the correspondence of Europe with Asia. The last courier which came by that route was the bearer of no less than 50,000 letters for Europe. This is not all. The presidencies of Calcutta and Madras would also have their direct communication with the mother country, without being compelled to make use of the Bombay line; and have, therefore, established a separate line of steamers, which, from next month, will run to Suez, touching at Ceylon, Madras, and Calcutta, to take and carry passengers from and to those different ports. Four steamers of 500 horse power each are already ready for this service. In the mean time, every exertion is making at Bengal for the extension of steam navigation on the magnificent river Ganges; in a short time the voyage from Calcutta to Benares, which cost the unfortunate Jacquemont so much labour and time, will be performed as easy as the voyage from Paris to Havre.

Steam navigation will shortly establish regular communications between the different points of the magnificent empire which the genius of England has founded in the south sea. A steamer has already commenced running between Sydney, Port Philip, and Van Diemen's Land. It is announced that other vessels will soon arrive to form a rapid communication with all those points by which England has attached the great continents of Australia, Van Diemen's Land, Norfolk Island, and the island of New Zealand. It is talked of, and it is an idea which will be eventually realised, of establishing a regular line of steam-packets between Sydney and Ceylon, or Calcutta, that is to say, to place Australia at a distance of from seventy or eighty days' run from Europe, whilst hitherto the voyage from the coast of Europe to that antipodean continent has seldom been less than from five to six months.

When we witness such marvellous results as these of the genius of England, we cannot avoid making painful reflections as to our own country. Where are our transatlantic steam-vessels? When will they be ready to commence their voyages? Are the great sacrifices offered by the government in promotion of this affair to be for ever without result? It is scarcely credible, that the gratuitous gift of steamers, and the formal promise of an allowance of more than a million of francs annually, has not yet induced the people of Havre, our first port, and within fifty leagues of the capital, to form a company for the service of the line to New York.

THE BAROMETER.

We extract the following from "Observations on a Meteorological Diary," published by A. Abraham and Co., Opticians, Glasgow:—

"The barometer indicating the most minute variations of atmospherical pressure, when correctly observed in connexion with other meteorological phenomena, various changes of weather may be deduced; hence the instrument derives its familiar appellation of the weather-glass. By ordinary observers, too much importance is attached to the words invariably engraved on the scales of barometers—*fair, change, rain*, &c., without paying the required attention to the actual cause of fluctuations in the mercurial column. The changes of weather are not indicated by the actual height of the mercury, but by the change from a given point. If, for instance, the mercury has rapidly fallen from 30 to 29 inches, or from the words *fair* to *rain*, and the result, as indicated, has been a storm, probably, after a short interval, the mercury gradually rises, accompanied by fine weather; by the casual observer the instrument would be deemed imperfect, because the mercury stood one or two tenths above *rain*, and the sun shining brilliantly—the farmer perhaps waiting anxiously for the mercury to rise to *fair*, would thus risk the loss of a favourable opportunity of reaping his produce. Again, if the mercury be at the word *fair*, and gradually descending, and rain the result, the barometer is condemned as useless. To prognosticate changes in the weather by the action of the barometer, the changes of the mercurial column should only be attended to. The barometer being an instrument for determining the weight of the air, and influenced in its action by variations of atmospherical pressure, if placed at a considerable elevation, would stand proportionably lower than one at the level of the sea; the mercurial column falls one-tenth of an inch for every ninety feet of perpendicular ascent—hence its value for determining altitudes; if, then, the words on the scale are only referred to, corresponding changes of the weather could seldom occur at the summit and base of a hill. In our climate, the fluctuations of the barometer are influenced in a great measure by the direction or force of the winds. In serene and settled weather, the mercury generally ranges about 30 inches at the level of the sea; and previous to, or during storms, it falls below 29. The following rules for predicting the changes of the weather, as indicated by the barometer, are from the best authorities:—

1. The gradual rising of the mercury generally indicates the advance of fine weather in summer, and in winter of continued frost, more particularly if accompanied by a north or north-east wind.

2. A gradual descent of the mercury denotes rain in summer, and snow in winter; westerly winds most generally prevail during the fall of the mercury, a south-west wind indicating a longer continuance of rain. If the fall has been very rapid, it invariably portends stormy weather, the surface of the mercury presenting a very uneven and jagged appearance; after stormy weather, the mercury generally rises very rapidly.

3. In sultry weather, the sudden fall of the mercury indicates thunder showers; during frosty weather, a thaw, and a sudden rise in winter, usually high winds and snow.

4. If, during summer, the mercury is low, with a beautifully clear sky, the atmospheric appearance must yield to the barometer—rain and sudden changes will soon approach; if the mercury has been low for two or three successive days, with the wind veering from north-west to south-west, heavy showers, with squalls of wind, are usually indicated.

5. Whatever change of weather suddenly follows any change in the barometer, its continuance will be of short duration: thus, if fair weather *immediately* attend the rise of the mercury, or reverse, if rain, a fall of the mercury.

6. If fair weather continue for several days, during which the mercury is gradually descending, a long succession of foul weather will most probably ensue.

7. If no change in the barometer is indicated in the wheel form by the motion of the hand, or in the vertical by a visible change in the mercurial column, by gently tapping the former, a slight movement of the hand will indicate its tendency to rise or fall; and by observing the surface of the mercury in the latter, if *concave*, falling; *convex*, rising.

8. If the mercury fluctuates considerably, alternately rising and falling, the weather will prove generally very unsettled and changeable; if the mercury falls *gradually* very low from a given point, it portends a heavy and long continuance of rain.

9. A sudden and extreme change in temperature, either from heat to cold, or reverse, rain generally follows within twenty-four hours.

Some of the preceding barometrical denotations occasionally occur without the anticipated results visiting the immediate locality of observation, although experienced at a distance."

SELF-DOING AND BEING DONE FOR.

THERE are some principles of great force in human affairs—as the energy evoked by habits of self-dependence, the persevering constancy kept up by hope, and the influence of property—to which too little attention, perhaps, is paid by the speculative thinkers of our age, when considering the circumstances which affect the welfare of communities. We are not sure that we have given these principles a proper degree of attention in some of our own speculations.

The effect upon a human being of bringing him up and keeping him in a state of pupil-like dependence on some stronger mind in his neighbourhood, is sufficiently striking. The native powers of such a person are never fully developed. The soft appliances to which he is subjected, have rather the effect of repressing and weakening such energies as he possesses. He acquires a tendril-like inclination to cling to the power by which he has been always protected, and to which he has been accustomed to look for the gratification of all his desires. Treated always as a child, he continues to be, in short, a child. Nor is it merely the non-development of intellect that marks his sad case; but, unable to think for himself, his very sense of right and wrong is languid, and he is content to take his morals, as well as his bodily aliment, from his protector.

In the case of one who has to plunge into the struggle of the world at an early period of life, with the consciousness of having only his own energies to trust to, how different is the result! There may be a danger of foundering at first; but, that over, we quickly see the adventurer exerting his whole powers—a manly, vigorous, and determined being. He may do much that is amiss. He may go sadly wrong upon certain occasions, for want of a prompter, or for lack of experience; but every error is a lesson to a mind so sharpened, and in time he attains to a far higher standard than he ever could have done under the fostering hand of any kind of protector whatever. This is very much, perhaps, what enables friendless youths so often to make an advance towards fortune, while others possessed of what are called advantages, such as the influence of paternal care and paternal fortune, come little speed. There seems to be an immense virtue in letting a youth, to use a common phrase, feel the weight of himself, though it is not always convenient or agreeable to do it.

Mr Laing, in his late work, "Notes of a Traveller," shows the same contrast to exist between nations whose governments perform all the public business by means of functionaries, and nations which are allowed to do the greater part of the public business themselves. In some continental countries, administration is nearly perfect as a piece of mechanism. From the central government proceed chains of officers in proper gradations, not only for the collection of the revenue as with us, but for the administration of justice, the management of the police, education, and the general business of the country. Mr Laing shows, that, while there are about thirty paid government officials in a Scottish county of 145,000 inhabitants, the department of the Indre and Loire, with only twice the population, has 378 such functionaries. The mayor and his adjunct govern a commune, equivalent to a parish with us; each canton, formed from a number of communes, has an inferior court of civil and criminal law, with five paid officials; each arondissement, formed from a number of cantons, has a higher court, with ten paid officials. An under-prefect takes charge of an arondissement, and a prefect is the highest officer of a department. It is calculated, that in all there are 138,000 paid functionaries in France, exclusive of the clergy, the police, the mayors of communes, and the persons engaged in enforcing custom-house laws. Government thus has every thing done for the people. It is well done, but with a cost of eight millions sterling, and it keeps Frenchmen in pupilage. Much of the best young energy of the country is diverted from the productive pursuits of industry to seek for posts under government. "All independence of mind is crushed," says Mr Laing, "all independent action and public spirit buried, under the mass of subsistence, social influence, and honours, to be obtained in the civil and military functions under government on the continent." With a show of political liberty, "the French people have as yet no real civil liberty." They cannot move from one place to another, even to exercise the elective franchise, without a passport from a government officer. "The spirit of subordination and implicit obedience, which we confine to military service, enters on the continent into civil life. A Frenchman or a German would not think himself entitled to act upon his own judgment and sense of right, and refuse obedience to an order of a superior, if it were morally wrong; nor would the public feeling, as in England, go along with and justify the individual who, on his own sense of right and wrong, refused to be an instrument of, or party to, any act not approved of by his moral sense."

How different the case in England! The bustle of petty dignitaries, vestries, and local councils, is often ludicrous; the unpaid magistracy has been subject for both jest and rancour; road trusts are notoriously liable to abuse. Yet all these things are highly serviceable, for they give individuals of an active turn of mind throughout the country something to think about. The necessity of considering and managing public affairs, on however limited a scale, brings out energies in the people, particularly where there is also the stimulus of popular election. An unpaid English magistrate is an independent being; he will put up with no ill usage or dragooning from high quarters. The unpaid town-councillor, though he may be pragmatical and officious, is generally honest and sincere. Mr Laing thinks that, down even amongst the rudest of the people, the active moral agency produced by self-government may be traced. The individual Englishman, the most uneducated and depraved, is superior, in the estimation of this traveller, to the educated continental man of a much higher class, in his discrimination of right and wrong in human action; "he is more decidedly aware of his civil rights as a member of society, and judges far more acutely of what he terms fair play, or of what is due to himself and by himself, in all public or private relations or actions. It is the total absence of government interference, by superintendence and functionaries, in the stream of private activity and industry, that has developed in a remarkable degree the influence of the moral sense on action among the English." Even in the occasional outbreaks which disturb the peace in England and America, our traveller sees the symptoms of something good at bottom. They come, he thinks, from the same spirit which stands forward to save nations on national emergencies. Germany and Italy never have any mobs: they are better without these express things, but they are the worse of wanting that national spirit, of which these things are probably manifestations, though of an irregular kind.

It would thus appear as if there were a perfect analogy between the effects of self-dependence in an individual and in a people. The man who thinks and acts for himself is often wrong, but he is in the main a superior being to one who is only right because he is kept in constant leading-strings. He will probably do something distinguished, while the other only does not do any harm. For all the exigencies of life, he will prove infinitely more serviceable than the other, and it will be his invariable tendency to become a leader. Just so with nations. The people of a free country may be rude and wrong at times; but it is only amongst them that any vivid energies will be found. They alone will make great and rapid advances. In any shock between the two, it can be no difficult problem which will go to the wall. This analogy is useful for the argument in both cases. If it is well for an individual to practise self-management and self-dependence, it may be presumed also to be so for a nation. If it is well for a nation, we may calculate with the greater confidence that the more that individuals are left to the exercise of their own energies, the better.

There is certainly at present a disposition to lessen the range of the self-doing principle. It springs from good motives, and there is perhaps need for it in existing difficulties and peculiarities in our social condition; but the evil is an evil for all that, and it is well to be fully aware of this, even while consenting to partial breaches of the principle. A prevailing outcry of the day, for example, is that the humbler classes are neglected, and go to misery and error for want of due tendence. It seems to be considered as a sort of duty in some people to do a vast deal more than they do for some other people. But no class of men should be in such need of help. Men of all classes ought to be perfectly independent of each other, in every thing but moral suasion and brotherly love and charity. If the state of our working-classes be so deplorable (not temporarily, but statedly) as is represented, there must be causes for it which no such superficial remedies can be expected to reach. We may—we must—take means to alleviate, if there is no immediate possibility of curing, the evil; but we should still keep in mind that constant pretendings from one class to be taking care of another, providing for it, flannel-petticoating it, cottage-and-gardening it, feeding it, and even educating it, must have a detrimental effect of its own, in reducing the independent tone of the assisted class, and rendering those composing it altogether inferior as men and as fellow-citizens. Those who give most largely of their means to stipendiarise the humbler classes are probably the most benevolent, but we question if they are the most effective, of the friends of those classes. In a well-directed effort so to improve their social circumstances as to enable them efficiently to help themselves, more real good is done to them. The industrial power of every well-constituted human being is sufficient, in fair circumstances, to provide for all needs, without man being beholden to man, or class to class. And we may be very sure that only when men are thus independent will they prove right moral beings, or show the energies of men.

The world has never certainly seen so rich a country as England. Its immense wealth is owing not to soil or climate; it is not owing, like that of ancient Rome, to the plunder of all other countries; it is owing to the immense productiveness or industry of its inhabitants. But an unexpected effect attends immense industrial productiveness in this and some other countries. Society becomes polarised into a few with much, and a many with little or no wealth. It may be very true that only large capitalists can carry on either manufactures or agriculture with the result of large production. But when political economy has carried the case thus far, moral economy may come in and

ask, if this result is not obtained at some sacrifice on her ground. Large establishments for production, whether in farms or factories, require that the great majority of the people should be merely *employés* under masters—persons in whom, necessarily, from their situation, many of the higher moral and intellectual energies of human nature receive an imperfect development. The principle of hope is universally acknowledged as one of great efficacy in human affairs: to how much good effort does it prompt, from how much error does it withhold!—nature's cheap stimulus to all duty! But the bulk of those who commence a life of labour have little to do with this great principle. They only can look for a continuance of the advantages which they enjoy, on the condition of their continuing to merit them. Again, the possession of even a little property is confessedly of vast efficacy in raising the moral tone of human nature. It increases self-respect, stimulates to exertion, and creates an interest in the social fabric of the world. This, also, is a principle of well-doing and well-being which the bulk of our working-men unfortunately do not enjoy. May it not be these wants which mainly cause those hitherto inexplicable exceptions from the high state of morality and the high state of affluence which our country has attained—namely, its vast mass of intemperance, and its not less vast mass of pauperism? High and low wages are not here the question. It is conceivable that a small rural proprietor, in Switzerland or Tuscany, realises less of money's worth by his toils than many of our working men; but then he has the dignifying and invigorating sense of property, and sees every day's efforts tell in making things a little better. He is thus made to keep up and go forward, while the tendency of the English *employé* is quite the reverse. It is no new observation, that most of our enjoyments lie in prospect, and in the tone in which the mind is preserved. If the smallest possible proprietor has most of this enjoyment, he is the best off, although others may be able to show greater gains.

If these be principles affecting the bulk of the industrious in this country, the philanthropic mind may well despond; for how can the social framework of a country be so completely changed as it would require to be in order to undo such evils? England will for certain go on producing its enormity of wealth, without much regard to the negative pole of the social magnet. It may only be expected that its humanity, ever a shining star in its forehead, will exercise a healing and restoring influence over much of the misery unavoidably flowing from its state, and that counteractive moral agencies will go on improving in strength and comprehensiveness. A nation under such circumstances is a curious spectacle. Units make the whole; but units, like the separate members of a coral-line community, work on instinctively, seeing little or nothing of the general result produced. A reef rises, before the multiform being at work knows what it is about. How difficult for any one out of the whole, then, to affect the case for either good or evil! Only it is sometimes found in the human coral, that wide-seers do at length arise and speak, and that their voices come in time to have power, and that new and better courses are accordingly taken for the general interest.

FAMILY MANAGEMENT.

A TALE.

"WHAT can be the reason Harriet and Miss Williamson are so late in returning from their walk?" said Mrs Aylmer to her husband, as they were sitting one November evening in the comfortable library. "What can they be about?" continued the lady, an additional shade of gloom passing over her face, as she watched the approaching shadows of night darkening more and more the room in which they sat. "That girl Harriet keeps the house in a continual state of agitation; I never know what it is to have a moment's peace with her mad-cap pranks."

Mr and Mrs Aylmer were people of rank and fortune, who resided in the south of England; they had married late in life, and the results of their union were two children, a boy and girl. Mrs Aylmer was chiefly remarkable for her capabilities of putting herself into terrific fits of ill-temper, which alarmed and subjugated all around her to fulfil all her behests, and for ruling with strict and unflinching authority over her respectable husband. Mr Aylmer's principal peculiarities were an excessive love of good English dinners, and long comfortable naps after them. Charles Aylmer, the son and heir, was a sickly spoiled boy of fourteen. He was ill-tempered, selfish, cowardly, and mischievous—the darling of his mother, who remitted in his favour the uninterrupted severity she showed to all else—the heir of the property, and the sovereign of the household. He was chiefly remarkable for telling tales of his sister; eating a surprising quantity of cakes and sweetmeats; a great love of tyranny, united to a strong sense of personal danger. He had a tutor, who, for L.100 per annum, with a considerable number of physical comforts, was willing to take charge of an unwilling pupil and a disagreeable boy. Harriet Aylmer was fifteen, a fine tall girl, very handsome, very high-spirited, very clever, and very disobedient, passionate, and mischievous; she had always shown great aptitude for teasing and laughing at her brother (for which she invariably got punished), and for treating with supreme contempt all existing authorities. Her character was redeemed from its great faults and unfeminine love of mischief by deep and strong powers of affection, which few had the power of calling forth, and by great kindness and benevolence towards those worse off than herself for the luxuries of life. She was neither her mother's darling nor her father's heir; and as they had some floating ideas of the necessity of both rewards and punishments in the education of children, they solved the difficulty by applying the rewards to Charles and the punishments to Harriet. Poor Harriet, she was no one's pet! She teased her brother, disturbed her papa's naps, grumbled at her mother's partiality, caricatured the tutor, disobeyed and disliked her governess, held Mrs Jones, her mamma's officious maid, in supreme contempt, and was disliked by one half of her friends, and continually reproved by the other; the only persons who loved her undividedly were her little dog Fido, the gardener's daughter, silly Jane, and most of the servants, who pitied and excused her.

Now that we have introduced the Aylmers to our readers, we will continue our tale where we left it off, in the old library.

"Well," continued Mrs Aylmer, "I must know what keeps them so long. Ring the bell, Mr Aylmer; Miss Williamson should remember I don't approve of a young lady of Harriet's age being out so long. Oh, here they come!" she exclaimed, as the door opened. It was not them; it was Charles and his tutor.

"Oh, mamma!" exclaimed the boy, bursting in with an excited look and heated face, "what do you think Miss Harriet has been doing?—she will get what she does not like, I expect, when you know."

"What has she been doing?" asked Mrs Aylmer; "something wrong, I have no doubt; but don't be in such a hurry, my darling. Poor child! you are quite out of breath; you will kill yourself with such speed. I thought I had told you, Mr Ramsay," said she, turning round to the embarrassed tutor, "that I do not wish Mr Charles to exert himself in this way, to put him in such a state. It is very odd people cannot attend to what is said to them."

"I assure you, madam," answered the unfortunate tutor, seeing a storm brewing in Mrs Aylmer's threatening brow—"I assure you, Mr Charles was so anxious to come and tell you that he saw Miss William" ——

"Stop, stop!" interrupted Charles, "I don't want you to tell mamma—I shall tell her myself."

The obsequious tutor was silent, and the spoiled child proceeded to relate how his sister had in a frolic seized upon and bound her governess to a tree in the adjoining wood. A servant was immediately sent to release her, and a search instantly made for the delinquent, far and near. Some one thought of going into her room, where she was found, sitting quietly by the window. By this time the unfortunate governess was released from her situation, and had returned home, with the determination of not staying another day with such a pupil. Pale with anger, she rushed into Mrs Aylmer's presence.

"Madam—Mrs Aylmer" — she gasped, as soon as she found words.

"I know all," interrupted Mrs Aylmer, waving her off with her hand. "Pray, do not repeat things so very unpleasant for a mother's ear; but I must say, Miss Williamson, you must have your pupil under very indifferent command, for her to get to such a pitch."

"Madam," again gasped the ill-treated governess.

But it was in vain for her to speak; Mrs Aylmer would not listen to her.

"Well, then, Mrs Aylmer," she at last said, "you will perhaps have the kindness to hear me when I say that, sorry as I may be to leave a house where I have experienced so much *kindness* and *lady-like treatment*, I am obliged to decline the honour of any longer conducting the education of your daughter."

"Spare yourself the trouble," interrupted Mrs Aylmer again, with a haughty glance, "for I have long thought of removing Miss Aylmer from your care, and the events of this night have hastened my determination." She rung the bell. "Robert, tell Mrs Jones to bring Miss Aylmer here."

"My dear, shall we not dine first?" interposed Mr Aylmer, with a timid voice. (He had been sitting for some time looking on in great annoyance at the bustle and turmoil going on around him.) "It is past seven o'clock, and the dinner will be spoiled," he continued, fidgetting in his chair, from a mixture of fear of his wife's anger at the interruption and dread of the dinner being over-cooked. His faint appeal was of no use.

"Mr Aylmer, may I beg of you once more not to interfere? I believe," said she, casting on him a glance of supreme contempt, "your dinner is of more consequence to you than all your family put together." At this moment Harriet entered, her brow firmly set, her mouth closed, and her whole appearance showing she had made up her mind to bear the storm hovering over her head with dogged indifference. It is needless to repeat her mamma's address to her; the specimen we have given of her eloquence will show the style of it. Harriet listened unmoved and unsoftened. "Well," said her mother, stopping at last for want of breath to go on, "what have you got to say for yourself? Speak—are you deaf?"

"No, I wish I were," muttered Harriet, sullenly; "I have not any thing to say; I know if I were to explain, it would do me no good—I should not get justice done to me."

"Leave the room, Miss Aylmer."

Harriet obeyed; in opening the door she passed the poor governess, wiping tears of mortification from her eyes. Harriet was touched; she went up to her, and, taking her hand, said, "Come, Miss Williamson, let us be friends; I will forgive you if you will me. I am sorry I tied you to a tree, but you put me into such a passion, I could not restrain myself." The governess flung away her hand, and, with flashing eyes, muttered something about hypocrisy. Harriet turned as red as fire; she looked round the room; her brother Charles was laughing at her disappointment. "Take that for your pains," said she, giving him a box on the ears, "you cowardly tell-tale;" and, with flashing eyes, ran out of the room.

The simple version of this adventure was as follows:—Miss Williamson and Harriet were taking their usual afternoon's walk. Harriet had brought with her in her arms her little pet Fido, who was seized with an unaccountable whim of keeping up a constant barking. Miss Williamson, who was not in the best of humours, having had a brief interchange of words with Mrs Aylmer, felt very much inclined to vent her ill-humour upon the present company. In no very gentle terms she insisted upon Harriet putting the dog down. Harriet refused, and Miss Williamson seized hold of the dog, and threw him roughly on the ground; poor Fido howled piteously, and limped away. With sparkling eyes and raised colour, Harriet took hold of her pet, and dared Miss Williamson to do it again. The governess was so unmindful of her position as to do it. Harriet said nothing, but not many minutes after, she seized her opportunity, and, being a remarkably strong girl, tied her governess to a tree; she then quietly left her, and going back to where her poor little dog lay really hurt, she took him up in her arms, and went to her own room, where she remained, with dogged firmness, till called upon to account for her conduct.

The next day, Harriet was conveyed in a close chariot by her mamma to a school some fifty miles off, celebrated for the strict seclusion and severe discipline in which the young ladies were kept. Mrs Aylmer, still burning with anger against her daughter, gave such a character of her to Miss Lewis, the head of the establishment, that this lady looked upon the entrance of Harriet into her house with almost the same fear and trepidation as she would had an Ogre, a Jack Sheppard, or an officer of the Guards, with a Lovelace kind of reputation, been presented to her as a boarder. However, seeing Miss Aylmer was of rank and fortune, and that much money, and, perchance, much credit (if she could succeed in changing her into a propriety-loving young lady), was to be gained by her admittance, she consented to receive her under certain severe restrictions, to all which Mrs Aylmer consented, and came away perfectly satisfied that she had introduced her daughter to such discipline "as would make her know herself," as she expressed it, "and regret the home she now despised." Miss Lewis was stiff, starched, and a decorum worshipper. She had no idea of imbuing her pupils with the genuine feeling of kindness they ought to have for each other; but she did her best to teach them never to behave *ungenteelly* to each other, and always to be polite and young-lady-like. She expected from her young ladies that they should know dancing, singing, piano, harp, drawing, French, Italian, all in a young-lady-like manner, and that they should have a certain elementary knowledge of all the other branches of education; that they should make a curtsy on entering a room, and another when they went out, and call each other *dear* when they spoke to one another; above all, that they should not know the meaning of the word love, or, at all events, if they were so unfortunate as to have this knowledge, they should *appear* not to know it, and be particularly incensed at the mention of the institution of marriage. Such characteristics, she considered, made a perfect *young lady*.

The second act in this drama of family management now opens.

Mrs Medcalf was the widow of a naval officer, who on his deathbed had bequeathed to her a modest income, and the guardianship of the orphan son of his dearest friend, whom, in the absence of any family of his own, he had adopted as his son. Mrs Medcalf was the sister of Mr Aylmer, but owing to the great difference between her character and that of her sister-in-law, and also to the disapprobation she continually expressed of the manner in which her nephew and

niece were brought up, she held very little intercourse with Aylmer House. She knew very little of the children, but had a general impression that they were very spoilt and disagreeable. One dark and stormy night in the month of January, she was sitting over her tea, musing on the approaching college vacation of her ward, William Mansfield—whom she longed to see as much as if he were her own son—when she heard a voice at the hall door begging to see her. There seemed to be some dispute upon the subject, so she rung the bell to know who was there, when the drawing-room door opened, and there entered with the servant the muffled-up figure of a young girl. Mrs Medcalf started; she knew the face, but could not at once recollect it, as the stranger advanced and threw up her veil.

"Aunt Margaret!" at last said our old friend, Harriet Aylmer.

"My niece Harriet!" said Mrs Medcalf, in utter astonishment; "what has brought you here?"—and she motioned to the servant to leave the room. "What is the matter?—what brings you here?" she repeated, in an anxious voice.

"I am come to ask you for a home and for a refuge from those who persecute me," said Harriet, with a burning cheek and almost menacing tone; "and if you refuse it me I go away, and no one will ever be troubled with me again."

Mrs Medcalf saw she was dreadfully excited. "Sit down, my poor girl," said she, soothingly, "and tell me what has happened to you—you look dreadfully fatigued and excited; I will do any thing I can for you. Do not be frightened," she continued, observing the sofa shake under the emotion of poor Harriet, who at length burst into such heart-rending tears and sobs, that her aunt thought she would almost fall into convulsions; she untied her bonnet and cloak, gave her some cold water to drink, and, finally, had the pleasure of seeing her restored to more calmness.

"These are the first tears I have shed since I left my father's house," said she at length, finding words to utter; "and I was nearly desperate, when your words, the first words of kindness I have heard, quite overcame me." She at once began her story; she related, in clear terms, the misconduct which had caused her dismissal from home, and her being sent with the most disgraceful of reputations to school. There she had had to undergo every kind of disgrace and contumely; she was not allowed to associate with the girls, nor were they permitted even to speak to her; she was always kept apart from every one, and every night was sent for into Miss Lewis's room, where she was accused of every possible fault and misdemeanour, and exhorted to repent of them. Tales of her misconduct at home were daily circulated among the girls, as warnings to avoid the like; and, in fact, every humiliation and mortification were showered upon her. "I was treated as a felon, and as if I had the feelings of a felon, and not those of a young girl like the others," said Harriet, with flushed cheeks; "so at last I could bear it no longer; I thought any thing would be better; and I watched and watched till I made my escape, and came to see if you would take me in; and if you had refused, I would have gone and killed myself," said she with vehemence; "I am sure I would. I had but a few pence in my pocket, as my money and jewels were taken from me, and I have walked fifty miles, sometimes buying a pennyworth of bread."

Mrs Medcalf shuddered with horror at this relation; she thought with terror of all the dangers her niece's violent temper, and the injudicious treatment to which she had been subjected, might have brought her. She was too sensible a woman to reason with her on her conduct that night, so with soothing words and kind promises she conducted her to her bed; she could scarcely refrain from tears when she saw her swollen and blistered feet, which she got bathed and bandaged, and giving her a composing draught, left her to seek that repose of which she stood so much in need. It was a late hour that night before Mrs Medcalf retired to her room; Harriet's conduct occupied her most anxious thoughts. She was a very superior woman, both in feeling and intellect; and she resolved, if possible, to take charge of her niece. She wrote an earnest and solemn letter to the parents, stating that Harriet was under her roof, and another to Miss Lewis, acquainting her that her former pupil was in safety, and that she need take no further measures for her recapture.

The next morning the aunt went into her niece's room; she found her just awake, very feverish, and evidently very unwell from fatigue and excitement. She sent for medical assistance; it was a week before Harriet was able to leave her bed, and *then* she was very much paler and thinner. In the meanwhile, Mrs Medcalf left her to the attendance of her trusty maid, and set out herself for Aylmer House. She exerted all her eloquence in representing Harriet's case to her parents, and her whole stock of patience in listening to Mrs Aylmer's animadversions in return. By dint of prophecies of shame and disgrace to the family, if Harriet, by unrelenting rigour, was driven to extremity, and confident promises of amendment if kindness was shown to her, she prevailed upon the mother to give her up to her charge. This Mrs Aylmer was the more readily induced to do, in despite of her jealousy of her sister-in-law's interference in family affairs, as she felt that Harriet's high spirit was too much for even her passionate temper to curb. She consoled herself for granting the request by remembering that her darling Charles would be only too happy to get rid of his sister for ever. After making, therefore, as many objections as she could muster together, she graciously acceded, and Mrs Medcalf returned content with her mission.

When her niece was sufficiently well to bear the news, she told her of her success. Harriet fell at her feet in an ecstacy of joy, and promised for herself much more than she was able to perform.

Time passed on. Mrs Medcalf knew she had taken a heavy responsibility upon herself in thus adopting her niece, and that the charge of so wayward and passionate a girl could not be otherwise than a distressing one; and such she found it, for, strive as Harriet would, she could not correct the faults of sixteen years in a few months, and many were the bitter hours passed by her in repentance and regret for having offended her aunt. But what will patience, unwearied kindness, and charity, not effect? Mrs Medcalf laboured hard at her task, and before six months were passed, Harriet looked upon the displeasure of her aunt as her greatest misfortune. But all were not like her aunt; to others she often behaved ill. Her aunt suffered. Harriet was heart-broken, and firmly resolved to do so no more—which resolution she kept, till a temptation too strong to be overcome came in her way. Fortunately this occurred more rarely every day, and Mrs Medcalf looked forward with sanguine hope to the reward of her benevolence.

About this time William Mansfield came to pass his college vacations with his guardian, before setting out on a three years' tour on the continent. He knew Mrs Medcalf had the disagreeable Miss Aylmer staying with her, who was known in all the neighbourhood as a mischievous vixen, and whose reputation had been more than usually severely handled, as she had no one to defend her. It was therefore with no pleasurable feelings that he looked forward to having his tête-à-tête conversations with his second mother, whom he loved most affectionately, disturbed by her presence. When he did see her, he was very much surprised to see so tall and striking a looking girl; and could scarcely believe that one who seemed so likely to grow up into a lovely and elegant woman, could really be so odious as she had been described. But, alas! these first favourable impressions soon wore off. Harriet was very apt to take antipathies, and she instantly disliked and felt affronted at the supercilious and slim collegian, who seemed to wish to keep her at such a distance, and to look with contempt on all she did and said. She was, besides, very shy, and consequently awkward, never being accustomed to see strangers. She was at one moment silly and bashful, at another rudely familiar; and she was not at the slightest pains to conceal that she looked upon his room as better than his company, to use her own more expressive than elegant phrase. As for William, he was disappointed to see his solitary interviews with Mrs Medcalf intruded on; and, we are afraid, looked upon Harriet as little better than a disagreeable interloper.

It was with these sentiments they parted, and Mrs Medcalf felt William's disappointment as not the least of her trials, for he had been accustomed to look upon her house as his undivided home. She was sorry also to see two persons, who were likely often to meet under her roof, and whom she felt would soon be equally dear to her, show so little mutual good-will.

The morning after he left, while Harriet and her aunt were sitting at work together, Harriet opened the conversation by observing, "I am glad William Mansfield is gone; he is a very disagreeable, proud, conceited man. I wonder, aunt, you are so very fond of him."

"Even granting that all you say of my poor William is correct, which I should be deeply grieved to believe," answered her aunt, smiling, "I should perhaps still love him. You know I love you, and many people say you are very disagreeable, proud, and conceited; but I do not think so," she continued more gravely, observing the colour mounting to Harriet's temples, while the tears suffused her eyes—"I should be sorry to do so. As for William Mansfield, he is a most amiable, benevolent, and liberal-minded young man; and let me tell you, Harriet, I did not think you showed either delicacy of feeling or gratitude to me, in gratifying your own prejudiced opinions, instead of remembering all I had told you of his worth. You behaved to him with great rudeness and unkindness, which I did not think you would have done towards one whom you know I look upon as a dear and beloved son, nor do you show generosity in speaking ill of him to me when I am overwhelmed with sorrow at his departure." Mrs Medcalf looked so seriously displeased that Harriet was miserable; she burst into a flood of tears.

"Ah! I behave ill to every one," said she, as she hastily left the room. The lesson was severe, but necessary; it never was repeated, nor again called for.

Two years have passed since this little scene. Harriet is eighteen, a clever, accomplished, talented girl, exceedingly lovely and graceful; perhaps there is too much vivacity in her movements, too much fire in the rapid glance of her rich hazel eye, for the strict propriety-chart of a fashionable young lady; but no one, even Miss Lewis herself, could fail to admire her open brow, beaming look, and the ingenuous smile of her half-opened lips, showing the pearly teeth beneath: she was Mrs Medcalf's greatest source of happiness and pride; she introduced her to the small but select society she was accustomed to see herself, and looked upon her as the greatest ornament of the circle. As for Harriet, love is a faint term to express all she felt for her aunt; she knew she owed not merely her present happiness, but perhaps even her existence, to her kindness—I cannot more aptly express her feelings, than to say she flourished in her presence and languished in her absence, and never felt thoroughly happy but in her company. Harriet had also been home several times; and though these visits had at first been hard to bear, no self-control now was too difficult for her to undertake to gratify her aunt. All the energy she had once shown to commit mischief and folly was now expended in obtaining control over herself, and giving pleasure to this generous friend. She had succeeded so well by her patience and gentleness, that even her lady mother was softened in her favour, and graciously contemplated having her home again, now that she was likely to do honour to the family name; but Charles expressed such decided disapprobation against this step, that, fortunately for the aunt and niece, the scheme was abandoned; as for her papa, he loved her as much as he was capable of doing, and much more than he did either his lady or his heir. Harriet's affectionate heart was often gratified by receiving from him kind letters and numerous presents, which showed he did not forget her; and when the family paid Mrs Medcalf a visit, Harriet endeavoured to make up, by her attentive solicitude, the trouble she had once given them. The absent traveller often wrote to them; gradually Harriet began to look upon him with the sisterly affection and interest which she felt to be due to the adopted son of her benefactress, and which his amiable character really deserved; she invariably called him cousin; and he on his side did not forget her—he often enclosed a few kind words for her, and sometimes sent her different specimens of the manufactures of the country he was passing through. It was impossible for Mrs Medcalf to write to him so often and familiarly, and not introduce the subject of her niece's improvement; and though William suspected the account to be slightly exaggerated, he still felt there must be much good to call forth such ardent praise.

"Aunt," said Harriet one morning, "I should like to thank my cousin William for his last present to me; shall I write a few words to him in your letter?" Her aunt consented; and thence sprung up a correspondence between the two pretended cousins, which did more to unfold their real character to each other than a year's fashionable acquaintance would have done. In happiness and content the time passed over, and now was the term of the traveller's absence nearly expired: they expected him from day to day.

One bright summer evening that Mrs Medcalf had gone out to visit a neighbouring cottage, and Harriet was alone in the drawing-room, a ring was heard at the door, and a strange voice inquiring for Mrs Medcalf, Harriet advanced to meet the stranger, whom she believed to be some casual acquaintance. The door opened, and a tall young man of about five-and-twenty stood before her; his naturally pale complexion embrowned by travel; a good-humoured smile played upon his lips, while his dark eyes gazed earnestly upon those of his wondering companion.

"You don't know me, I see, Miss Aylmer," he said. After a moment's reflection, the truth flashed upon her: that tall manly figure was that of the slim, pale collegian she had seen three years ago—it was William Mansfield. With a vivid blush, she placed her hand in his. "Is that all the welcome you give your affectionate cousin and old friend?" said he, as he kissed her blushing cheek; "remember what a long time I have been absent, and how delighted I am to see you all again." Mrs Medcalf was sent for; she could not sufficiently admire his manly appearance and intelligent conversation; and they separated that night mutually pleased and happy. Harriet admired the liberal and enlightened sentiments expressed by William, his benevolence, and gentle manners. William thought Harriet the loveliest girl he had ever seen; and when he fell asleep, visions of her open brow and laughing eye were mingled with the kind smile and loving kiss of her aunt. As for Mrs Medcalf, she admired them both, and thought within herself "'Twere a pity so pretty a pair should ever be parted."

The intimacy of the *cousins* every day became greater; William, for worlds, would not give up the relationship, it afforded him so many opportunities of showing love and friendship which pass current among relations. One day, some months after his return, as they were walking out together, Harriet was conversing upon a theme she never tired of—her beloved aunt. Gradually she began to relate the adventures of her early youth; William had never heard them before; he listened earnestly, and could not sufficiently admire the truthful ingenuousness with which she related her youthful follies. "Where should I now be?" said she, as she concluded her tale, looking up with enthusiasm in his face, "if my aunt had not taken pity upon me?"

"Certainly not in my arms," said the daring lover, clasping her to his breast with an insinuating smile. "Tell me, Harriet," said he, in a voice which he meant to be irresistible, "will you not make up for being so naughty a child by being a good girl, and promise to love a modest, well-disposed youth like myself for the rest of your days?"

Harriet broke away from him, but it was in vain to feign displeasure; she did not feel it. She again gave

him her hand, with the half-serious condition that he would behave better another time. Before they returned home she had promised to be his wife, if her aunt approved of their union. Mrs Medcalf *did* approve of it; and before another month was passed, William was pleased because he had won Harriet for his wife; Harriet was pleased because she was married to the man she loved; Charles was pleased because he now had Aylmer House to himself, without fear of intrusion; Mr and Mrs Aylmer were pleased because their daughter had married a man with L.5000 per annum; and the good aunt was pleased because *evil had been changed into good.*

OCCASIONAL NOTES.

EMIGRATION.

We are constantly receiving newspapers from the different colonies, and also papers respecting the colonies published in London, and the great broad fact appears on the face of all, that the colonies, with scarcely an exception, are greatly in want of labourers. "*Send us labourers,*" is the cry of the Canadians, the Australians, and the settlers of the Cape and of New Zealand. The demand is heard from one end of the colonial world to the other, and the most flattering temptations are held out for complying with it. At a meeting held at Niagara—called in the *Niagara Chronicle* "The Great Emigration Meeting"—which took place on the 7th of January last, a long speech was delivered on the subject by Dr Rolph, in which he speaks of the exertions made by the inhabitants of Montreal to render emigrants comfortable on their arrival, to relieve them if sick, or in a state of destitution, and to forward them to districts where their labour is required. He adds, that at the many public works now in a state of advancement in the provinces, there is a steady demand for mechanics and labourers; and that as many as "one thousand able-bodied labourers are at this moment urgently required on the Welland Canal."

Of the demand for labourers at Sydney we need here say nothing, as we lately gave publicity to the letter of a "Magistrate of the Territory," mentioning that the demand was excessive. We turn, then, to the Cape of Good Hope, which, from all we have heard, has been steadily but unostentatiously advancing in a career of prosperity. Such, we are informed, is the demand for labourers at the Cape, that the inhabitants are thankful to receive and hire African slaves, who have been liberated by British cruisers while on their way to America. But they tell us they would infinitely prefer white and trained servants from the home country. At a late public meeting on the subject at Cape Town, it was resolved to raise funds by subscription to defray the expense of bringing emigrants from England. The temptations held out are—a delightful climate, meat at 2d. a-pound, and a hearty welcome to all steady and respectable persons willing to make themselves useful.

We have thus sufficiently drawn attention to the circumstance of the colonies being, according to their own showing, in want of labourers; and the point to which we now advert is the extraordinary degree of negligence on the part of the colonists themselves, in actually making known and getting what they want. If they wish to see a host of working men with their families arrive on their shores, why do they not take some trouble to make working men acquainted with that important fact, and also tell them how they are to get out? If every thing be true that the colonial and emigration journals say, the case stands thus:—*There*, at a distance of a few thousand miles across the sea, are immensely large countries, as fertile as the heart of man could desire, yet comparatively destitute of persons to work upon them; and *here*, on the other hand, is a country overcrowded with population, with a redundancy of labourers, almost starving for lack of employment. Does it not, then, appear somewhat strange that the colonists should take no intelligible means of supplying themselves with these spare labourers? Every colonial newspaper teems with accounts of "great emigration meetings," at which resolutions are passed declaring that thousands of men are required, and in some instances arrangements seem to be made for paying the passage of individuals; but beyond these public declamations little seems to be accomplished, and the process of emigration remains year after year in the same meagre, unsatisfactory condition. We dare say the "Great Emigration Meeting" at Niagara thought it had done a vast deal, by its powerful resolutions and speeches, to promote emigration from the United Kingdom; and yet, we ask, what labouring man here knows any thing at all of the matter, except perhaps what we are now telling him? Three years ago, we copied into our paper the account of a similar meeting at Montreal, at which it seemed to be the resolution to establish agents in this country for the purpose of receiving and handing forward emigrants. Our brief notice brought dozens of letters from poor people, inquiring where these agencies were situated. We could not tell; and are pretty certain that no such agencies were ever established. This is a sample of the slovenly manner in which the colonies set about the great business of helping themselves to servants. Instead of opening fixed establishments in this country, to advise and help forward emigrants, they perhaps send a person to lecture on the subject. We do not want lecturers. The public are already sufficiently alive to emigration, and only want some practical advice, assurance of good treatment, and assistance.

The inhabitants of Montreal, greatly to their honour, have, it seems, organised a humane system of assisting the poorer class of emigrants; but who in Great Britain knows that such is the case? In this as in every thing else, the colonists appear to labour under an impression that what they do is heard of through the medium of their newspapers, which, we can assure them, is a fallacy. The people of Great Britain and Ireland seldom, by any chance, see a colonial paper, and know nothing of what is going on in the colonies. The home newspapers, they must know, seldom notice any colonial movement unless it be of a warlike or political character. The opening of new ports and roads, public improvements, establishment of societies, progress of cultivation and agriculture, and such matters, remain unnoticed, from an idea, perhaps, that the quoting of paragraphs on these points would excite little interest in British readers. For example, in the speech of Dr Rolph, above alluded to, we observe a number of interesting particulars respecting the social progress of Canada within the last two years, but we doubt if a single newspaper, not expressly colonial, will notice them. This remarkable silence of the general newspaper press on colonial matters was exemplified on the occasion of the outbreak in Canada a few years ago. Nobody had been prepared to hear of any such uproar; and while civil war was raging in a department of the empire, the people of the home country could not comprehend what it was about. We mention this only to show that the colonies should adopt some more effective means than now exists of making all reasonable complaints and demands heard in this country. Whenever they have a desire to operate distinctly on public opinion, they must appeal *directly* to the people through the medium of our newspaper press.* But to make their designs respecting emigration known, something more is desirable. The great mass of persons whose services are most required in the colonies, see no newspapers. Ploughmen, shepherds, day-labourers, men with families living in remote situations, and female domestic servants, form an understratum in society into which the products of the daily press do not commonly penetrate. The persons in such situations are thrown entirely on their own glimmering conceptions of what they have to expect by emigration, or they rely on the advice of such individuals as they imagine will set them on the right track.

Do not let it be supposed that we advocate a sweeping system of emigration. We advise every man to stay at home who possesses a decent livelihood, or the intrepidity to push his way by skill and industry. Our observations are directed to the colonists, who are making such an incessant clamour about the want of labourers, and to the great number of labourers who feel desirous of emigrating. We have thought considerately on the subject, and it appears to us that the process of emigration will never be any thing else than the scramble it now is, until arrangements of the following nature are organised, and fully and fairly acted upon:—

1. Every colony which wishes labourers must, on its own side of the water, organise means to receive and employ all who arrive seeking employment—have plenty of lands ready surveyed for emigrants to buy in lots, if they want to settle in that way—and, above all, have a person in waiting on the arrival of every ship, to tell the people what they are to do; so that, in short, a man would arrive with a perfect confidence as to his being at once satisfactorily provided for.

2. Each colony must organise means equally as effective here. It must send a properly commissioned agent (who should be backed, or recognised as trustworthy, by the colonial and home government), to establish an emigration office in every large town, as, for instance, in London, Edinburgh, Glasgow, Liverpool, Cork, &c. This office should resemble an open shop, be furnished with maps and plans of the colony, and descriptive pamphlets and papers explaining what classes of emigrants are required. The keeper of the office should be an intelligent and conversable person, who would take pains to explain, in a friendly way, every desired particular—tell exactly how the proposing emigrant should proceed, which port he should sail from, and, if possible, put him in communication with the skipper. Sub-offices in remote localities might be opened in connexion with these principal establishments.

3. It should be part of the office-keeper's duty to publish advertisements in the newspapers, and also by handbills, defining the objects of his mission, and stating his readiness to furnish every species of information to applicants. The handbills should be posted up in most towns and villages throughout the country; and the language employed in them ought to partake of the simplicity of common speech.

If the various colonies could unite to appoint a common agency, much expense might be spared; but we fear that is quite hopeless, and would therefore advise each to start on its own account in the first place. It will be observed that we say nothing of paying for transmission; that must be left to the capacity of the colony for raising funds. Very distant colonies, possessing means, might instruct their agent to pay the whole, the half, or the quarter, of passage-money, according to circumstances. Canada, in our opinion, could get an abundance of hands, merely by the organisation we point out, because numbers of men are able to pay for themselves, and many in a state of destitution would be assisted by parishes, subscriptions, and private friends. As government, according to all accounts, is about to establish a better system of marine transport for emigrants, it cannot be doubted that, by the simple plan we have hinted at, the colonies would speedily be in possession of labourers commensurate with their capital. Those states, likewise, in the North American union, which are at present desirous of procuring free labour (Virginia, we believe, for one), might advantageously follow the same method, which, by proper management, would, we seriously believe, be successful beyond any assignable limits.

* Within the last few years, the growing importance of the colonies has called into existence a class of periodical publications, chiefly newspapers, in London, which are devoted either to colonial topics generally, or to the concerns of single colonies in particular. Among these we may notice, as standing at the head of the whole, "The Colonial Gazette," which, we have heard, has been of considerable use in schooling the colonists with regard to their political and social relations.

ANAGRAMS.

An anagram consists in the transposition of the letters of any word, or set of words, so as to form, by a new arrangement, some other term or terms, having an application, of one kind or another, to the sense of the original words. The art of forming anagrams was a species of literary trifling so much in fashion in the days of Elizabeth and her successors the Stuarts, that the learned Camden did not disdain to compose an essay on the subject, in which he lays down the laws to be followed in the composition of the anagram. The precise in practice, he says, changed not one letter, with the exception of the aspirate *h* alone, which, like the Greeks, who merely symbolised it by a comma, they conceived to have no proper title to be called or used as a letter. The less strait-laced anagrammatists, however, took other liberties, such as that of substituting *u* for *v*, *c* for *k*, *s* for *z*, and the like. Camden himself liked the anagram exceedingly, as yielding "a delightful comfort and pleasant motion to honest minds;" and the more difficult the anagram the better, as it is then, he says, "a whetstone of patience to them that shall practise it; for some have been seen to bite their pen, scratch their heads, bend their brows, bite their lips, beat the board, tear their paper, when the names were fair for somewhat, and they caught nothing therein." All this seemed to our antiquary a very charming sort of perplexity.

Anagrammatising is of very ancient date, having been one of the ways by which the mystical religionists of old locked up their secrets, and endeavoured to throw a sanctity around the names of peculiar persons and things. The Jewish cabalists directly professed the art of *themura*, that is, of changing or transposing terms to discover a hidden signification in them. This is precisely the art of making anagrams. From Noah's name they made *grace*, for example, in Hebrew; and in Messiah they found *he shall rejoice*. In the *Cassandra* of Lycophron, a poem written about 300 years before Christ, we find the first name of Ptolemy Philadelphus transposed from *Ptolemais* into *Apo melitos*, "from" or "out of honey;" in which case the second *o* would be obtained by placing '*O* before the name, making it "the" Ptolemy, as being a generic appellation. The name of the same king's wife, *Arsinoe*, was anagrammatised into *Eras ion*, "Juno's violet." Other ancient writers, Eustachius among the rest, give examples of the art as used among the Greeks. To come a little farther down the mount of past time, we find Friar Bacon, according to a common custom, concealing one of his gunpowder ingredients, *charcoal*, under an anagram. As might be expected, the French were early and long attached to this sort of badinage; so much so, that Louis XIII. had a regular anagrammatist pensioned at 1200 livres a-year. In France, a man sometimes even made his fortune by working out a single happy transposition of a king's or great man's name. Thus, all France rung with the anagram on the monarch, *François de Valoys*, whose name was converted into *De façon suis royal*, indicating him to be indeed "of regal strain." *Marie Touchet*, favourite of Charles IX., would not allow the lucky fellow to go unrewarded who discovered her fascinations to be indicated in the very name which she bore, and which says, *Je charme tout*, "I charm all;" and a vacant clerkship, a sinecure without doubt, would to a certainty fall to the no less fortunate man who found the chancellor *Louis de Boucherat* to have been baptismally and patronymically designated for his high office, because his name told that he *est la bouche de roi*, "is the mouth-piece of the sovereign."

Even Calvin deigned to anagrammatise. His adopted Latin title, *Alcuinus*, is a very simple transposition of *Calvinus*. Nor did the grave reformer disdain to enter into an anagrammatical contest with Rabelais, in whose Latinised name *Rabelaesius*, he found the words *rabie laesus*, "bitten by madness." Rabelais was not the man to let a shaft of this kind be aimed at him without a return, and accordingly, using some liberty with the lexicographically-jumbled letters *i*, *j*, *v*, and *u*, he found in Calvin's name the old French vulgarism *jan-cul*, which casts a disagreeable reflection on the person of the Reformer

It was one of the weaknesses of this age to imagine that, from a transposition of the letters of names, grave and important indications of the truth might sometimes result. Thus, when it was found out that *James Charles Stuart*, the baptismal designation of James I., was convertible into "claims Arthur's seat," it was seriously said, that "this shows his undoubted rightful claim to the monarchy of Britain, as successor to the valorous King Arthur." The anagram in question was the production of a Welshman named Owen, famous for these sort of things, and was prophetically made before James came to the English throne. Another on *Jacobus Steuartus*, "James Steuart," runs thus:—*Tu es ob justa carus*, that is, "For thy just acts art thou beloved." Another, and really a happy and simple one, makes out of plain *James Stuart* the words "A just master." James's favourite, the noted Villiers, had an anagram of rather an appropriate kind made on his name, while he was an earl. *George, Earle Buckinghame*, was transposed into *Oh, grave, able king, grace me!* a prayer which the monarch, for flatteries much akin to that conveyed in the anagram, was pleased to listen to most graciously, as was not unfelt by the national purse.

Elizabeth had her full share of this species of honours. The two following transpositions are among the most apposite made on the name of the maiden queen: *Elizabetha Regina* was found convertible to *Angliae eris beata*, that is, "A blessing shalt thou be to England;" and *Elizabetha Regina Anglorum* was turned to *Gloria regni salva manebit*, or "The glory of the kingdom shall remain intact." Lord Chancellor Ellesmere might have taken a family motto from an anagram made on his name, *Thomas Egerton*; namely, *Gestat honorem*, "He is arrayed in honour." When the vile assassination of Sir *Thomas Overbury* took place, an anagram appeared on his name, exclusive of the title, which Sir Symonds d'Ewes speaks of as not unworthy to be owned by the first wits of the age. It was, *O! O! base murthyr.*

Collet, whose curious Relics of Literature contain much information on this subject, informs us that one "Mistress Mary Fage," in the time of Charles I., devoted a whole volume to the publication of anagrams and acrostics composed by herself. Mistress Fage was indeed a mistress of the art. Princes, peers, and prelates, to the number of four hundred and twenty, are both anagrammatised and acrosticised in her "Fame's Roll," in the subjoined fashion. *John Weymes*, Earl of Weymes, was one of the parties whom she delighted to honour; and she makes of his name the really good transposition, "Shew men joy." The acrostic commences thus:

> "In your great honour, free from all alloy,
> O truly noble Weymes, you *shew men joy*;
> Having your virtues in their clearer sight,
> Nothing there is can breed them more delight."

And so on with *Weymes*. What honours, and rewards more tangible than honours, fell to the ingenious Mistress Fage, history faileth to record. Some peculiarly happy anagrammatist made out of General Monk's name a chronogram, marking a date as well as an anagram. Thus, *Georgius Monke, Dux de Aumarle*, was found to form *Ego regem reduxi, Anno Sa. MDCLVV.*; in English, "George Monke, Duke of Albemarle," "I restored the king, in the year of safety (*Sa.* for *Salutis*) 1660."

Owen, the learned Welshman, has been referred to. He had a happy knack of making his anagrams epigrams, and sometimes, in two lines, contrived to turn one word half a dozen ways. As he wrote in Latin, and as, in translation, the anagrams are necessarily lost, we content ourselves with giving an humble imitation of one; in which, with the help of a *so*, something like his plan will be made manifest.

> "Since *brevity* of speech *so* charms the ear,
> Let no *verbosity* in thine appear."

But Owen could manage the matter without coupling two words, and all due laud be accordingly given to him for his ingenuity.

By anagrammatising his name, Sir Thomas *Wiat* was found to be "A wit;" *Waller* had the "Lawrel" in his patronymic; and *Vernon* was baptised to "Renoun." *Crashawe*, the poet, had a beloved friend of the name of *Car*, and having found out that his own designation was convertible to "He was Car," he made the circumstance the basis of some affectionate lines bearing on the friendly union which their names showed to exist between them.

In modern days we have had no lack of anagrams, though no hidden virtue can now be found in them. Three of the most noted men of recent times have been each the subject of good anagrams. One of the best made on *Napoleon Bonaparte* is in Latin, being *Bona rapta, leno, pone*; which, Englished, signifies, "Rascal, yield up your stolen possessions." *Arthur Wellesley, Duke of Wellington*, is transposable to "Let well foil'd Gaul secure thy renown." Better still than these is that which makes of *Horatio Nelson, Honor est a Nilo*; meaning, "His honours are from the Nile." The following are amusing and apt general anagrams. What is *Revolution?* "Love to ruin." A *Telegraph?* "Great help." What are *Lawyers?* "Sly ware.' What comes from a *Dispensatory?* "O! I send pastry." Is the *Assembly* composed of good men? "Yes, lambs." Who moved the *Amendment?* "Ten mad men." What do the Catholic *Representatives?* "Serve Saint Peter." Got you *Satisfaction?* "It is a fact, son." Perhaps, however, the subjoined anagram, with which we shall come to a close, is better than any of these.

> "When *I cry that I sin* is transposed, it is clear,
> My resource, *Christianity*, soon will appear."

Though anagrammatising be unquestionably the veriest trifling, it may, like the composing of Bouts Rimés, serve very well to pass a social evening; and, being so far an exercise of the intellect, it is certainly preferable, as an occupation for such hours, to many with which even cultivated circles have long been in the habit of employing themselves.

A FEW WEEKS ON THE CONTINENT.

LUCERNE TO BERNE.

HAVING satisfied our curiosity at Lucerne, we moved *en route* to Thun,* a distance of between fifty and sixty miles, and therefore too great a stretch for Louis to perform with his cattle in the compass of a single day. But we were in no hurry; our object being to see, saunter, and inquire, not hasten over a certain space of ground in a given period of time. The road which we pursued lay in a westerly direction from Lucerne, and was one of the wildest we had traversed. The weather, also, had all at once changed, though fortunately only for a day or two, to gloom, mist, and drizzle; and the face of nature was altogether dismal. Proceeding by a hilly path across a limb of the Brameg, the torrents were seen dashing furiously in foam from the lofty summits of the mountains, and the river Emme, a tributary of the Reuss, swept impetuously onward, carrying rubbish and all the loose objects it could collect in its headlong course. At different points on the journey, the waters from the hills had brought down great masses of sand and gravel, which lay scattered over the little patches of field occupied by a pains-taking peasantry, ruining their crops for the season, and levelling their hedgerows and bushy enclosures. Thus, however, from the deposits of mountain debris, have the lower arable lands of Switzerland been originally formed; and, more wonderful still, thus have been created the broad territories of the Netherlands, which are in reality composed of particles of mud floated by the Rhine from the higher grounds of Switzerland. The flat green polders of Holland were once rocks on the Alps of the Grisons, Glarus, and Berne.

About mid-day, in a tempest of wind and rain, we were ushered into the large roadside inn of Entlebuch, where, though apparently out of the world, we were served with a dinner of first-rate character, and, as usual, at a very moderate charge. Our place of lodgment for the night was farther on, at Langnau, a village somewhat different in appearance from places we had formerly seen. We had got out of the Roman Catholic and somewhat stand-still cantons which border on the Lake of Lucerne, into the plain, common sense, Protestant canton of Berne, in which there is as much hard work, and as few holidays, as any political economist could well desire. Langnau is situated in the midst of a fertile vale, and seemed to be occupied by an industrious rural peasantry. All the houses are of wood, unpainted, and generally of such a size as to accommodate perhaps five or six families each; the various entrances being by different flights of steps and half-pendent galleries. Some are distinguished by texts of scripture, carved in the beams running along the front, and from dates also carved over the doorways, we saw that several were two centuries old—a great age for a merely wooden house; but the fabrics are greatly preserved, I should think, by the large overhanging roofs, and by the practice of fumigation from the wood fires, the smoke being often left to ooze out by the doors, windows, and other casual openings.

A forenoon's ride through a country of low green hills and well-cultured dales, reminding me, in many particulars, of Scotland, brought us to Thun, which was to be our head-quarters for a few days. Thun is a substantially built old-fashioned town, situated chiefly on the right bank of the large river Aar, about half a mile below the point where it issues from the Lake of Thun; but the river here parts into three channels, again uniting a short way down, and therefore the town is a good deal cut up into separate sections, connected by wooden bridges. A large volume of water, one way and another, possessing a beautiful green tinge like the Limmat and Reuss, rushes past and turns several large mills for the inhabitants. Like Zurich, the town has got rid of its ancient gateways; the streets are open to the adjoining country, and we were pleased to see various symptoms of improvement in the environs.

In the course of our rambles we ascended, by a flight of steps of uncommon length, from the main street to the summit of a huge knoll, on which stands, with some other buildings, the old castle of Thun and the church of the town. The view from the walls of the churchyard is picturesque and grand beyond description. Looking in a southerly direction, we have the magnificent range of the Bernese Alps, covered with snow, and among which the Jungfrau rises conspicuous with its rugged glaciers, the whole fronted by a range of dark rocky mountains, including the Stockhorn and Niesen, both of which are remarkable peaks. Then, beneath these, we have the Lake of Thun with its wild romantic shores; and following the Aar, to where it passes us, and rolls away to the right, there is spread out a country rich and beautiful in the extreme.

From the beauty of its environs, and its suitableness for the retirement of foreign families, Thun has become a place of considerable resort of late years, and we found its hotels crowded with visiters. These establishments are situated most advantageously a short way east from the town, in the midst of fine pleasure-grounds, at the base of a woody hill, and close on the banks of the Aar. The houses, three in number, and capable of accommodating at least a hundred individuals, independently of lodgings for servants and coachmen, are conceived on a most superb scale, yet are not dearer than establishments of an ordinary kind, and certainly far less so than any third-rate inn in England. In one of the edifices is a *salle de lecture*, or reading-room, in which we found an English newspaper for the first time since entering Switzerland, and also an old friend—a copy of our own Journal. The keeper of these hotels is a singularly enterprising person. To accommodate the English, a handsome chapel, in the Gothic style of architecture, was finishing on the face of the hill, within the pleasure-grounds. And to bring and carry away customers who may visit his establishment, he keeps a small steam-boat constantly plying to and from the upper end of the lake.

An excursion to the farther extremity of the Lake of Thun and the country beyond, including Unterseen and Interlaken, formed a chief object of our visit; and as two or three days would be spent in our examinations, we here found it necessary to dispense with Louis's services, or at least to leave him free to seek another engagement. This was sad news to the kind-hearted lohnkutscher. He belonged to Lausanne, and had built himself up in the hope that we should proceed thither; he was right so far, but we had resolved to spend a few days in Berne besides those in Thun, and the expense of detaining him seemed to be unnecessary. It is true, I afterwards repented not retaining him for the whole journey, for though well enough served, we never again procured so honest and joyous a soul. Louis received his fees with a downcast air; wished a *bon* voyage to *les dames*, to whose fears in descending the mountains he had always been most attentive; said he was sorry we could not take him home to Lausanne, where his family resided, and to which all other Swiss scenery was a mockery; and, with many adieus, we parted. Next morning he was hired to proceed back to Zurich, but at what time he might regain his home it would be difficult to say; the profession he followed might keep him wandering about the country for months. A poetic friend, to whom we mentioned the little story of our intercourse with Louis, and his melancholy parting, has thrown the lohnkutscher's sentiments into the following random versification:—

THE LOHNKUTSCHER'S SONG.

The strangers summon me now to the route,
They come to visit our lakes and rills,
To see our snow-fed cataracts spout
In beauty from a thousand hills.
My charge is ready, my horses neigh,
And I must mount as soon as I can;
Yet, ere I depart, will a fond thought stray
To sweet Marie and pretty Lausanne.

Now, now we are pacing along the road;
Gaily *les Anglais* are chatting behind;
While at times I point to some fair abode,
Or spot made famous by valour or mind.
Kindly they question—I quickly reply;
Poor though I am, they esteem me as man;
Yet still and anon will remembrance fly
To sweet Marie and pretty Lausanne.

At night in a friendly home we stay,
And off on each morrow we jog again;
The freshening breeze of the early day
Brings lightsome spirits and health in train.
Lo! in the distance our Alps arise!
Barely their ever-white summits we scan;
Ah! much less dear are these hills to my eyes
Than sweet Marie and pretty Lausanne.

Hark! from the mountains the *Rans-de-vaches!*
How at these sounds doth my bosom glow!
Now, could I die, 'mid the sabres' clash,
For my own, my cherish'd Canton de Vaud.

* Pronounced Toon.

Canton de Vaud, so lovely, so fair,
How oft 'midst your vineyards my young foot ran;
And oh! what dear ones this moment are there—
With sweet Marie in pretty Lausanne!

Kind strangers, I fain would pursue your way—
But longings for home are astir in my heart;
Oh! bend to Lausanne your footsteps, I pray;
You cannot—you ought not—thus to part.
Delightedly hoped I to reach my dear home
With you in your tour over hill and champagne;
But you go whither Louis too far would roam
From sweet Marie and pretty Lausanne.

Departing by the morning steamer from Thun, we were in a few minutes on the lake—a sheet of water about half the dimensions of that of Lucerne, and much more regular in outline. From one extremity to the other, it may measure about twelve miles. The shores are lofty, and in some places precipitous, overhung by huge piles of hills, partially wooded, and here and there dotted with chalets, or rude mountain cots. With the exception of one or two small villages, the scenery is all still nature, and, on the whole, is neither picturesque nor interesting. But we were now becoming fastidious.

At the farther extremity of the lake, the passengers were disembarked, and immediately commenced a scramble for hackney-caleshes, voitures, and chars—the latter what we should call four-wheel gigs, with folding-up hood, drawn by one horse, and very sorry affairs. Some were going to explore a waterfall ten miles off, and be back in time to return with the boat; some were bound for the Oberland; some for Brienz. Not one was going to stay and see what could be seen in the very interesting spot of ground on which we were now landed, except ourselves. But it is always so with the English tourists. During our whole journey we never saw any one looking contentedly at what happened to be at the time before him—every body was hurrying forward to see something somewhere; and if it was at the top of a hill, or across a precipice, where there was some chance of personal danger, so much the better. The glory of *saying* they had seen so and so, appeared in most instances the prevailing object of ambition.

That part of Switzerland in which we had now arrived, is a little secluded world in itself. A plain of about three miles in length, and from a quarter to half a mile in breadth, is bounded on both sides by lofty rugged hills, above which, on the south, towers the sublime summit of the Jungfrau; while at one extremity is the Lake of Thun, and at the other the Lake of Brienz. Originally, I daresay, these sheets of water had been one, but soil from the mountains has formed an alluvial vale, and narrowed the watercourse to the neck of river, the Aar, which is now the only bond of union between the two lakes. The vale, sunk among lofty heights, flourishes a green paradise in the wilderness. It is richly clothed with verdure, ornamented with forest and fruit trees, and the seat of a numerous population, composed of Swiss and foreigners, the latter being principally English, who have made the discovery that the situation is at once *cheap*, agreeable, and salubrious. There are two villages. The first we come to is Unterseen, a surprisingly old-fashioned place, situated on the Aar, at the distance of a mile from the hamlet at which we were landed.

Unterseen consists entirely of wooden houses, thoroughly Swiss in shape—great overhanging roofs, outside stairs and galleries, casement windows, and all ornamented with long inscriptions of a considerable age. On one house we observed the date 1614, and a beam over the gateway at the entrance to the village was marked 1654. The leading street, at the centre of which is the open market-place, is mean and tortuous, without the slightest vestige of modern improvement or taste; while the general aspect of affairs, though not indicating positive poverty, or the squalor one sees in the large Scotch towns, is slovenly, and I should scarcely think wholesome. The antique houses are hives of population from the ground to the garret, and I can only say that those who imagine that living in cellars is only found in England, have never seen the dingy dens of Unterseen. As dirt is not usually put into pictures, the place, I have no doubt, with its romantic environs, will look extremely beautiful and picturesque—on paper.

From Unterseen to Interlaken, the road is almost a continuous avenue, lined by tall bushy trees, here and there varied with an ornamental villa or boarding-house; and at length we have such a mixture of trees and houses as to make it difficult to say where the village begins or ends. The greater part of this rural retreat appears to consist of houses of a superior order, devoted either to casual lodgers or stranger residents of longer standing; and we can testify to the village numbering among its larger establishments an inn of immense size, and possessing all the qualifications that any body could desire. The ladies were charmed with Interlaken. Never was there such a pretty place. It was like a scene in a theatre. Neat pavilions filled with Swiss toys exhibited their attractions under great spreading trees; long shady walks, with seats, invited the visitant to loiter away the lazy hours, and from over the bounding enclosures came the perfume of flowers and orchards. The adjacent hills—the Silver Horn, the Monk, Mount Eiger, and, above all, the brilliant white Jungfrau piercing the blue firmament—contribute at once shelter and picturesque beauty to the scene. With these attractions, and, as is said, cheapness of living, it is not surprising that Interlaken has become the home of self-expatriated English.

The shop-system of Interlaken may be said to be that of a perpetual fancy fair. On every hand there is something pretty and characteristic of the country for sale. The staple commodity is articles carved out of a pure whitish wood, for which the Swiss are celebrated. How pleasing is it to find a small community taking up some branch of trade for which its habits and tastes adapt it, and positively making wealth out of next to nothing! We had found a population drawing a subsistence at Spa from wooden painted boxes, another at Wiesbaden from the carving of deers' horns, and now we had one living by that simple manufacture which consists in shaping bits of wood into small objects of fancy and domestic use. Ever blessed and honoured be the spirit of honest industry wherever it is found; but doubly blessed be the industry which bears up against the influence of untoward circumstances, personal and local. Once I visited an humble cot in a country part of Scotland, the inhabitant of which was a poor lad, who for some years had been confined to bed in consequence of a paralysis of the limbs. Was that young man repining at his melancholy lot, and wasting his faculties in idleness? Not at all. He was sitting up cheerfully in his couch, carving small boxes and card cases, while all around him were spread the instruments and half-finished objects of his labour. A spectacle of industry like this, sets to flight all notions of inapplicability of any person or place for any kind of manufacture. As in the case alike of this poor Scotch lad and the Swiss cottagers, all difficulties melt away before a willing heart; and where that is wanting, every advantage of situation is useless.

I confess I was interested in the manufactures of Interlaken, and took much more pleasure in learning something of them than I should have been with the view of a waterfall. The articles are not made here only, but in other parts of the country, and chiefly by persons in the intervals of labour in the fields, and, consequently, for the most part during winter. It is a universally recognised principle in Switzerland never to be idle, if any thing can be done, or unless there is some decided festive sport to attend. Every district has some kind of article which it is the hobby of the people to make. I believe they do not try their hand on wooden clocks, these being the staple of the hills of the Black Forest, in the grand dukedom of Baden—a district, however, which is territorially adjacent to Switzerland, and from which ship-loads of these articles are exported annually to England and America. At the present moment, the cottages of Scotland are supplied with clocks from this quarter, through an extensive ramification of agents and venders. Complaints have sometimes been heard from hand-in-pocket out-of-the-way towns, that they are languishing for want of some species of manufactures. Here is one I can see no reason why they should not take up. An Englishman should surely be as able to make a clock as a German, or a toy as well as a Swiss. The Swiss toys range from a very humble to a high order, from an article of the value of a penny to that of a pound—the better class of objects being beautifully carved vases, baskets, and other things of a fanciful kind, well known to persons of taste.

Ascending by a winding path the picturesque hill which bounds the vale of Interlaken on the east, and leading towards the Lake of Brienz, we had an opportunity of enjoying a very delightful walk and seeing the Swiss cottage manufacture in active progress. As we had remarked a hundred times before, many of the houses were intolerably dirty, and a small village, which we attained at the nearest point of the lake, was, without exception, the most odious in this respect we ever beheld. But, at the same time, the spectacle of industry was equally extreme. Before almost every door was a woman, brown and skinny, working as if for a wager at skutching hemp, by means of a wooden apparatus which made a loud clacking noise; the place being seemingly in the possession of a set of female furies, every one of which would have answered to act the part of a witch in Macbeth without painting or dressing for the character. Within doors, industry of another sort was exercised by children and old people. Some were carving fancy objects, and in one house about a dozen children were engaged in making small toys, such as horses, sheep, and dogs, some cutting the pieces of wood, and others painting them. One little fellow was very seriously engaged in putting leaves of green paper on stumps to form trees; and another was painting a row of toy soldiers three inches high. This we found was a place of manufacture for the foreign market. The children of an insignificant Swiss village were working at something like a penny a-day, to furnish means for amusement to the more fortunate children of England and other countries. The juveniles of younger growth, who were not yet in harness in the workshops, also were not idle. A number seemed to be loitering out of doors on the outlook for strangers; and on our making our appearance, we were beset by offers of egg-shells decorated with the pith of rushes, and other trifles. The practice, as may be supposed, is little else than a disguised beggary, but the disguise at least assumes the semblance of virtue, and is less reprehensible than positive alms-seeking.

But I must bring my paper to a conclusion. We visited the shores of the Lake of Brienz, which appeared to be much more savage and desolate than those of Thun. Tourists who are desirous of exploring the country beyond have now an opportunity of doing so by a small steamer, which daily navigates the lake from Interlaken. Our return to Thun offered nothing worth mentioning; and I may add, that neither did our journey to Berne, our visit to which will form the subject of next article.

VULGAR HALLUCINATIONS.

THE MOCK KING OF MUNSTER.

As happens in the case of all great changes affecting the social framework, the unsettlement of the long-established form of clerical polity in Europe during the sixteenth century was attended with popular commotions equally extensive in their amount and destructive in their effects. Such consequences are, indeed, more peculiarly inseparable from revolutions in the religious world. Except in extreme cases, secular authority may be transferred from one body to another without the reins of governmental discipline being relaxed in any great degree; but it is not so as respects clerical affairs. When the European princes judged it right, at the era of the Reformation, to leave their subjects free to quit the pale of the old church, they were also left free, upon the same principles, to select for themselves a new spiritual path. Wild were the delusions and appalling the errors which resulted, in that comparatively barbarous age, from this unfortunate but unavoidable necessity. Madmen, fanatics, and impostors, with persons in whom, perhaps, all three peculiarities were mixed up, had here an ample field for their operations, and they left not the opportunity unused. Intending to notice popular hallucinations of various kinds in succession, we conceive that we may, without quitting our path, give some account here of one extraordinary instance of the kind springing from the source described.

The modern sect of Anabaptists use, in consequence of their adoption of a peculiar custom, a denomination which was made odious in Germany in the sixteenth century by a set of impostors and fanatics of the most depraved description. In 1533, there came to Munster, in Westphalia, a Dutchman named *John Bockholt*, a tailor by profession, and a native of Leyden. He was a ringleader of a fanatical party in his own country; and, with the aid of a John Matthison, one Gerhard, and some others, began to spread his mischievous principles in Munster. The time was, unhappily, but too favourable for such an attempt in Germany, where the ancient religious customs of the people were torn up by the roots, leaving them impressed with vague notions of an approaching new era, and ready to listen to the wildest speculations on the subject.

This was fully shown in 1525, twenty years before this period, when a fanatic named Munzer had the art to raise a numerous army of Suabian, Franconian, and Saxon peasants, and took the field with the intention of overturning all governments and laws, under the pretence that the world was now to be governed by the Founder of Christianity in person. The Saxon Elector, and other princes, raised an army, however, and routed the insurgents. Immense numbers were slain in battle and executed. John Bockholt soon gathered a party in Munster, whom he persuaded that a new spiritual kingdom was to be established, and that Munster was to be its capital, under the title of the New Jerusalem, whence the novel doctrines were to be disseminated over the earth. This idea was flattering to the mob, and the Leyden tailor gained continual accessions of adherents. As he went on, even the learned, including some monks, joined his sect, until at length he found himself powerful enough to venture on his great project. His followers rose suddenly in arms, attacked and deposed the magistrates, and became masters of the city. Immediately afterwards, John of Leyden was proclaimed *king* of the New Jerusalem.

We have said nothing of the doctrines or personal doings of the man who thus got the sway of a great city, containing many thousands of people. His extravagances are almost incredible. He married eleven wives, to show his approbation of the polygamy which prevailed in the times of *other* kings of Jerusalem; and to assimilate himself to a particular king of the Hebrews, he ran or madly danced, without apparel, through the streets of Munster. Other most offensive and pernicious acts were daily committed by this mock-monarch, whom it is too much charity to set down as insane. He of course saw visions, and dreamt dreams in abundance. In one dream it was communicated to him, he said, that the cities of Amsterdam, Deventer, and Wesel, were given to him as his own. He accordingly sent disciples or bishops thither, to spread his new kingdom. In the state of the public mind at the period, these pseudo-embassies were not, as they appear now, ridiculous. The Amsterdam envoy gathered so many proselytes that he attempted to seize on the city. He marched his followers to the town-house on a given day, with drums beating and colours

flying. Having seized on the house, he fixed his head-quarters there; but the burghers rose, and with some regular troops surrounded the fanatics, the whole of whom were put to death in a severe manner, in order to intimidate others of the class.

It may well be imagined that the city of Munster was in a dreadful condition under John of Leyden, it being a doctrine of the sect that all things should be in common among the faithful; and they also taught that civil magistrates were utterly useless. Hence enormous crimes, as well as ridiculous follies, were practised continually—real enthusiasm of belief adding to the evil rather than diminishing it. The following incident is the only one descriptive of the insane and scandalous practices of the sect which we shall venture to record—a specimen is enough. Twelve of them met, five being women, in a private house. One of the men, a tailor by trade, having prayed for four hours in a sort of trance, then took off his garments, and throwing them into the flames, commanded the rest to do the same. All did so; and the whole subsequently went out to the streets, which they paraded, crying "Woe! woe! woe to Babylon!" and the like. Being seized and taken before a magistrate, they refused to dress themselves, saying, "We are the naked truth!" Were it not for the sequel, we might simply feel disgust at this, as the doing, possibly, of shameless profligates. But when these very persons, instead of being placed in lunatic asylums, were taken to the scaffold, they sung and danced for joy, and died with all the marks of sincere religious enthusiasm.

John of Leyden did not long enjoy the throne of Munster. Its rightful sovereign and bishop, Count Waldeck, aided by other petty princes of Germany, assembled an army, and marched against the city. The fanatics shut its gates, and resisted; nor was it until after an obstinate siege that the occupants were overcome. The mock monarch was taken, and suffered a cruel death, with great numbers of his wrong-headed associates.

The popular hallucination, however, did not end here. The severe laws which were enacted after the deaths of Munzer and Bockholt, in order to check the spread of their principles, were of no preventive value, perhaps the reverse. We are told by Mosheim, that immediately after the taking of Munster, "the innocent and the guilty were often involved in the same terrible fate, and prodigious numbers were devoted to death in the most dreadful forms." There is proof, too, as in the single case detailed, that even where great profligacy characterised their peculiar course of conduct, there was often mixed up with it such an amount of sincerity, as ought to make us think of them with pity as beings labouring under a strange delusion, rather than blame them as persons erring under the common impulses leading to vice. "In almost all the countries of Europe, an unspeakable number of these wretches preferred death, in its worst forms, to a retractation of their errors. Neither the view of the flames kindled to consume them, nor the ignominy of the gibbet, nor the terrors of the sword, could shake their invincible but ill-placed constancy, or induce them to abandon tenets that appeared dearer to them than life and all its enjoyments."

SMALL COTTAGE FARMS.

The occupiers of a very few acres of land, whether as owners or renters, although by no means an insignificant class of the community, either as regards numbers or the position they occupy, or ought to occupy, in society, have hitherto received little attention at the hands of writers on rural economy. How they may have been affected by this neglect, we do not intend at present to inquire. Sufficient be it for us, if we can suggest any means by which the condition of this class can be improved. There are few counties in the United Kingdom in which cottage farmers are not found, in larger or smaller numbers, particularly in Ireland; and the manner in which they can most advantageously better their circumstances, is the object of our present observations. It unfortunately happens that this class of agriculturists, whether proprietors or renters, proceed on no proper principle of management, and are in reality little better off than the peasantry by whom they are surrounded. The grand error consists in a rigid adherence to old prejudices, and these it ought to be always a matter of importance to examine and abandon, if opposed to the light of science and practical economy.

Cottage farmers are not supposed to require the aid of any other machinery than that which they can use with their own hands. Ploughs, and all the ordinary apparatus of the great farmeries, are out of the question. The principle to be pursued is, to make the hand labour of the whole family tell to a good purpose on the productive capacity of the soil; and thus, by saving any money outlay, actually compete with the large farmer, who pays for all the assistance he requires. In order that the cottage farmer may make the very most of his possession, he must work it thoroughly with the spade. Some persons imagine that common delving is all that is meant by spade husbandry, which is a mistake. The soil must not only be turned over, but dug or trenched, by which the earth may be thoroughly stirred and mixed to the depth of eighteen inches or two feet; and where the soil proper will not admit of this, then a portion of the subsoil must be stirred in the operation of trenching. At the time this is being performed, all large stones should be removed, in order that the crops which shall be cultivated in the ground may be free from all such obstructions. In this process, however, care must be taken, where there is no great depth of natural soil, not to bury that of the best quality beneath the inferior kinds or the subsoil; and it is by no means a difficult matter, during this operation, to keep the best quality of soil nearest the surface. By a complete loosening and mixing in this way, exceedingly poor soils may be made to yield better crops than those of a very good quality under the ordinary mode of cultivation; and what tends to make trenching a matter still more deserving of adoption is, that, through a long course of years, there is no necessity for disturbing the ground below the depth that the spade or the plough commonly penetrates in ordinary culture.

It is after this manner that the Flemings have succeeded in bringing so much barren and waste ground, not simply into a cultivated state, but actually into a condition of great productiveness. The plan they adopt is this:—A ditch or trench, two or three feet wide, is dug with a trenching spade to the depth of two feet, or nearly so, if practicable, care being taken to place the best quality of soil uppermost, and to pulverise and mix the whole carefully; levelling the inequalities of the surface as the work proceeds. When such a trench has been completed, the digger commences another of similar width, and so proceeds until the whole piece of ground has been dug over or trenched. Where the ground is so wet as to require draining, drains may easily be made, at convenient distances from each other, as the work advances; but it is frequently found that trenching, in a great measure, obviates the necessity of draining, inasmuch as the subsoil is rendered so loose that the water readily percolates through it. It occurred that, in subduing the once barren heaths of Guelderland and the adjacent provinces, the difficulty of obtaining manure was so great at the outset, that nothing but the most hardy plants, and those inferior crops which do not refuse to grow on barren soils, were attempted to be cultivated; at length, by bringing a portion of them under the surface soil, and accumulating small quantities of manure at first, and afterwards larger, by degrees the most barren of these sandy soils became enriched, and by mixing and manuring, acquired the necessary degree of retention of moisture and compactness of parts, so that the more valuable crops were substituted for the poorest ones.

In alluding to these practices of the Guelderland farmers, which prevail throughout Flanders, we cannot sufficiently impress on the minds of cottage farmers the great importance of saving every particle of manure, liquid or solid, and disposing it at proper intervals on the fields. In Great Britain, hundreds of thousands of pounds are lost annually by neglecting this grand point in rural economy. Every drop of manuring liquid should run into tanks, covered to prevent evaporation, and all the more solid materials should be consigned to a pit, also covered from the weather; the addition of any waste vegetable matter to the mass of decomposing substances will increase the bulk and value of the manures so secured, and, if properly incorporated with the soil at fitting occasions, the few acres of the cottage farmer, be they naturally as barren as the wilderness, will be made to bloom like a garden.

Trenching and manuring are thus the two great means of melioration. The difference between trenching and ploughing is, that in the one case the spade dashes, breaks, and pulverises the soil, putting all the particles in the way of doing their duty to the roots, while in the other, the plough leaves many lumps of soil unbroken or untouched, and therefore of comparatively little use to the vegetation. We have some remarkable instances of the value of trenching in our own island; and probably not a more striking one than what has taken place on the "Muirs of Drumforskie" (now called Charleston), in the county of Kincardine, where comparatively worthless lands, by letting them out on "improving leases," apportioning a few acres of those waste lands to each family, have by trenching, draining, and spade culture, been brought into such a state of productiveness, that, at the expiration of the leases, 357 acres have been estimated to yield a clear revenue of L.750, or at the rate of two guineas per acre, per annum.

Under the old system of agriculture, except where the soil was exceedingly fertile, *three* acres was the quantity of land usually set apart for the keeping of a cow the whole year round, and never a smaller allowance than two acres. Consequently, an occupier of four acres of good land could not keep an amount of stock beyond two cows. Something over half of the four acres would be required for summer pasture, and the remainder would be scanty enough to supply the necessary quantity of hay-grass. Sometimes a small holder of this sort would break through the old regulation, and plough up an acre or so for corn of some sort; but as the abstraction of an acre from the four would greatly diminish either the pasture or hay crop, and as every thing connected with the cultivation of a corn crop by the plough would have to be hired, and the straw prove but a poor substitute for hay where only milch cows were kept, it is doubtful if such a proceeding would be found an advantageous one.

We will now proceed to show what may be effected by first trenching the ground after the manner already explained, and afterwards by introducing such vegetable products as are best calculated to thrive on the particular quality of soil under cultivation, and also to yield the largest supply of nutritious food. If, in a family of five or six persons, there is no one capable of assisting the husband in the operation of trenching, it would require several years to elapse before the whole of the four acres could be thoroughly trenched; but an active and industrious man would find little difficulty in bringing half an acre annually into an improved state; for as 80 rods make the half acre, and there being 313 working days in the year, to accomplish this it would require little more than a quarter of a rod to be trenched daily, whereas a moderate day's work, even where the soil is stony and difficult to trench, would considerably exceed a rod. But where there is a boy or two to assist, an acre might, with perfect ease, be brought into an improved state yearly.

Several experiments have been made in order to ascertain the quantity of produce in roots, artificial grasses, &c., that an acre of ground, under this sort of culture, could be made to yield; and the result has been that even less than 80 rods, or half an acre, will produce food sufficient to maintain a cow. This calculation is founded upon the well-known fact, that 100 lbs. weight of green food, a considerable portion of it roots, is a sufficient daily allowance for an ordinary cow. But cows kept upon such produce must not be allowed to pasture on those portions of the ground that are devoted to grass crops, such as clover, lucern, tares, &c.; but for the better health of the animals, they should have an open space to move about in adjoining the shed or out-building, where they find shelter from the storm and cold; for in soiling cattle during the hottest part of summer, an open shed, with a rack for their food, is to be preferred to shutting them up in close stables. Mr Allen, in his "Colonies at Home," very properly remarks—"Whenever it is possible to make a rod of ground produce 500 lbs. of the artificial grasses, in the several cuttings during the season, I greatly prefer it to any thing else, for cows thrive best upon grass and hay." He afterwards observes, in reference to this sort of food—"As it sometimes suffers much in dry seasons, we must not depend entirely upon it; but I have proved that it is possible to keep a cow all the year round upon the produce of half an acre of land, if it be carefully cultivated." He then proceeds to give a list of the produce he raised, which consists of lucern, cabbage, tares, mangel-wurzel, potatoes, turnips, parsnips, and carrots; and as a portion of hay is indispensable along with some of the root-crops during the winter season, he did not attempt to grow it, but sold a portion of his potatoes, and laid out the sum he received for them in hay.

It might be too much to expect that a small cottage farm of four acres, under the management of an ordinary cottage farmer, could at once be made to produce sufficient food for the keep of *eight* cows (half an acre to each cow), in the place of *two* cows under the old system of cottage farming. But giving him the advantage of an extra acre—that is, reducing the number of cows from eight to six, the products of his various crops, under good management, where the soil is tolerably fertile, would be amply sufficient to maintain *six* cows, or three times the number he formerly could keep; for, according to this estimate, there would be nearly three-quarters of an acre to each cow. It is certainly true, that, even after the whole of the ground had been trenched, there would be more labour annually required to cultivate the sundry crops, and to feed and look after the cows, than was required while the land continued under the old system of management; but, surely, the produce of the four extra cows would be more than sufficient to pay all expenses, even were it necessary to hire all the extra labour and attendance.

By dairy-farming in this way, small occupiers, whether owners or renters, might greatly improve their present condition: proprietors, in particular, might raise themselves to a state of independence to which they can never aspire while their few acres of land are allowed to remain comparatively uncultivated. Nor would this be the only advantage, since, by the increased productiveness of the soil, a larger proportion of the necessaries of life would be supplied for the benefit of the general community.

It has been proved, over and over again, that an acre of ground, *well cultivated*, will yield abundance of both corn and vegetables for the support of a family of moderate size. Hence it would become an object highly deserving a small occupier's consideration, whether it would be more to his advantage to grow his own corn, or to keep one cow less; for if an allowance of three-quarters of an acre is given to each cow, that quantity of land would yield sufficient corn for a year's consumption; and whether the yearly produce of *one* cow—that is, the value of the milk, butter, &c., yielded by her—would effect the purchase of a supply of bread stuff, is somewhat more than doubtful.

If means and accommodation permit, we should recommend cottage farmers to keep an ass to assist in taking produce to market, or in any other serviceable job. As the ass will eat almost any kind of green food, and that even which is refused by cattle, and is a humble and willing servant, he may be made to contribute materially to the comfort of the cottage farmer and his family.

DANNECKER THE SCULPTOR.

We find, from a notice in the *Art Union*, a monthly journal of the fine arts, that the celebrated German sculptor, Dannecker, died at Stuttgard on the 8th of December, in the eighty-fifth year of his age. "To all artists (observes our authority) who have visited Germany, his works are well known, and his fame has reached all English lovers of art through his widely celebrated 'Ariadne,' an exquisite composition, in the possession of Bethman, the banker at Frankfort. The early history of Dannecker is like that of many, very many, first-class artists, and might be written in less than a dozen words, from that vocabulary which supplies the plain means of describing the commencement of every similar career; these are, poor parents—innate devotion to art—intense application—difficulties—success. His parents endeavoured to thwart his inclination for the plastic arts; but the fascination was too strong upon him, and it carried him through all their opposition. His father was employed in the stud of Duke Charles of Wurtemburg, to whom the youthful Dannecker explained, personally, his views; and in 1771, at the age of thirteen years, obtained permission to study in the academy at the 'Solitude,' a ducal residence near Stuttgard, where pupils received, gratis, instruction in painting, sculpture, and music. One of the principal rules of this academy was infringed in the admission of Dannecker—for the students admitted were not below the middle rank of life; he, however, soon distinguished himself, and bore away, in his sixteenth year, the prize from older competitors—the prize awarded to him for his model of 'Milo of Crotona.' Friedrick Von Schiller was a fellow-townsman of Dannecker, and also a fellow-student at the Solitude, where a friendship commenced, of which a lasting memorial remains in the famous statue of the illustrious poet. In 1780, and in his twenty-second year, he quitted the academy, as did his friend Schiller at the same time. While studying, he was encouraged by employment from the duke, who afterwards appointed him sculptor to the court, with a salary of 300 florins a-year—about L.25. Ardently desiring improvement beyond what his native place could afford him, his wishes pointed to Paris, which place he received permission to visit; but at first without any addition to his pittance, which was increased by 100 florins only after a residence of some time in that capital.

At Paris he became the pupil of Pajou, and made the friendship of the sculptor Scheffauer. At that time, as now, in the French capital, the facilities for the study of nature were greater than in any other European city. To this study, therefore, he devoted himself during the term of his sojourn there, which was about five years. In 1785, he quitted Paris in the society of Scheffauer, with whom he proceeded to Rome, where he attracted the attention of Canova, by whose instruction and advice he was much benefited. In Rome, also, commenced his friendship with Goethe and Herder, who, like himself, were seeking inspiration from the relics that enriched the Eternal City. In Italy his reputation took its rise; for there he produced works which caused the academies of Milan and Bologna to elect him a member of their respective bodies. On returning to Stuttgard, he was employed for some time in modelling various subjects for Duke Carl; and he was thus occupied until 1796, when he again commenced working in marble, and executed his famous 'Sappho,' which is at Monrepos. Many busts of very celebrated persons are among the works of Dannecker; and none better known than that of his early friend Schiller. His works in marble and bronze are numerous, amounting in number to about 500; of his busts, that of Lavater is considered the finest; and of his ideal productions, his *capo d'opera* is a statue of the Saviour. This last-named work was finished in the year 1824, having been a subject of elaborate study during eight years. For the original conception he was indebted to a dream; and, perhaps, no other work of its class acquired, during its tardy progress, a greater degree of renown for its author. For some time before his death, Dannecker was but the wreck of what he had been, and had ceased, from mere superannuation, to exercise his art."

A CHANCE SPECULATION.

A certain citizen of Montrose, it is said, wrote to his agent in London to purchase a ton of copper for him; but the letter being one of the very worst specimens of penmanship, as well as perhaps not very correct in point of orthography, the agent read the order a *ton of capers*. Surprised at such an order, but nevertheless anxious to oblige his correspondent, he immediately set to work, and bought up the commodity in all quarters till he had the requisite amount. This, as may be conceived, was attended with the very natural effect of creating a demand for capers (in the language of trade, capers came to be inquired after), and also of rendering them scarce, so that they in consequence rose very much in price. The agent now wrote his correspondent that he had had great difficulty in fulfilling his order, but at last had succeeded in procuring for him a ton of capers; but that capers had since risen very much in price, and if he chose to sell, he had now an opportunity of realising a handsome gain on the transaction. The Montrose citizen, as might be expected, was very much astonished in his turn by the communication, and the manner in which his order had been fulfilled, but had the good sense to write immediately to sell by all means; and thus, it is added, pocketed a considerable sum from an unintentional speculation and unexpected advantage. Such a thing is possible, or may be conceived to succeed, with a commodity like capers, of which there is always a limited quantity in the market, but resembles one of those stratagems of war by which a town is sometimes taken, the success of which is more wonderful than would be the failure.—*Corbet's Inquiry into the Wealth of Individuals.*

THE LOVER AND THE BACHELOR.

A DIALOGUE—BY J. WILSON.

[*From the Londonderry Journal of 21st July* 1840.]

LOVER.

Scorner of wedlock, thou dost seem
Content and gay in love's despite;
Thy life glides on as doth a stream,
Unruffled by the tempest's might.

The storms of passion never cloud
The placid calmness of thy brow;
Thou'rt ne'er elated, never bow'd,
By joy or sorrow more than now.

Serene and fair as summer sky
Thy cheerful aspect, mild and meek;
Thy breast doth never heave a sigh;
Care hath furrow'd not thy cheek.

Oh! that this boiling blood of mine
In such unruffled course would move!
I'd change this leaping heart for thine!
But, tell me—didst thou ever love?

BACHELOR.

Brain-addled boy, I pity thee,
If thou in woman's toils art caught:
Peace cannot dwell but with the free;
And, oh! the bitter cup is fraught

With wormwood, that the soft white hand
Of passion to its victim gives!
Boy, trust not woman's visage bland;
She ever smiles when she deceives.

A serpent in her bosom lurks;
The fascination of her eye
Destruction to its victim works;
And shun it most when 'tis most shy.

A pouting lip and hectic cheek
(Though bile-suffused the one may be)
Are things to make a young heart weak;
But suffer not their sovereignty.

Or sorrow may thy breast assail;
For woman is a wavering thing—
Capricious, vain, and sure to fail;
And oft the fruit of love's a sting.

LOVER.

Ah! speak not thus, my hopes to mar—
Love, surely, is not all a dream!—
Some may be false, but many are
And ever will be what they seem.

At least, the heart that throbs to mine
Accursed deception never felt:
And, oh! at love's unalter'd shrine
The good of every age have knelt.

BACHELOR.

And been befool'd, as thou wilt be—
Love may be strong, but seldom stands
The tug of stern reality,
Without a loosening of its bands.

The cares that ever wait on those
Who link their fate on life's rough road,
The lover never feels or knows
Until compell'd to bear their load.

And then the carping ills of life
Dispel all vain, delusive dreams:
The husband frowns upon his wife,
And wonders where hath flown the beams

Once seen or fancied in her eyes,
Piercing his heart and bosom through;
And where the hoped-for paradise:
Ah! fain he would—but dare not rue.

LOVER.

Enough, enough, I'll hear no more
Of worldly wisdom; will is weak
When feeling makes the heart adore,
And bids it either yield or break.

'Tis not the symmetry of form,
The mellow cheek, the melting eye,
The rising bosom, soft and warm,
That forces from my breast a sigh.

It is a something which was ne'er
By language yet defined, but starts
From mutual eyes, when they declare
The wordless secret of two hearts.

BACHELOR.

Thou'lt have thy will, impetuous boy;
And why should I disturb thy dreams?
But ah! anticipated joy
In borrow'd radiance always gleams.

Such whims my fancy ne'er shall strike;
Give me a book, a friend, a chat;
And if I may not love, I'll like,
And stroke my sleek old dog and cat.

[Had we written the foregoing verses, we certainly should not have allowed the bachelor to have the last word.]

M. PERIGORD AND HIS DANCING-DOG.

The following anecdote is from the Life of Wilberforce:—"We were talking of the levity and gaiety of heart of the French, even under the severest misfortunes. This drew forth an anecdote, which had been related to him by Mr Pitt. Shortly after the tragical death of Marie Antoinette, M. Perigord, an emigrant of some consequence, who had made Mr Pitt's acquaintance at Versailles, took refuge in England, and on coming to London, went to pay his respects in Downing Street. The conversation naturally turned upon the bloody scenes of the French Revolution, on their fatal consequences to social order, and in particular on the barbarity with which the unfortunate queen had been treated. The Frenchman's feelings were quite overcome, and he exclaimed, amidst violent sobbing, '*Ah, Monsieur Pitt, la pauvre reine! la pauvre reine!*' These words had scarcely been uttered, when he jumped up as if a new idea suddenly possessed him, and looking towards a little dog which came with him, he exclaimed, '*Cependant, Monsieur Pitt, il faut vous faire voir mon petit chien danser.*' Then pulling a small kit out of his pocket, he began dancing about the room to the sound of his little instrument, and calling to the dog, '*Fanchon, Fanchon, dansez, dansez!*' the little animal instantly obeyed, and they cut such capers together, that the minister's gravity was quite overcome, and he burst into a loud laugh, hardly knowing whether he was most amused or astonished."

SUPERSTITIOUS OBSERVANCES IN RUSSIA.

Lent and all fast days are kept with much greater strictness in Russia than in any Roman Catholic country, and the poor may literally be said to fast, for they never eat any thing but haricot beans, with rape-oil and black bread, during this season; and so bigoted and superstitious are they upon the point, that nothing would induce them to transgress this ordinance of their church. A criminal who had murdered his mother at Odessa, was sentenced to receive the knout, and be banished to Siberia if he survived the punishment; he did so, and on his road there, the gang to which he was attached halted one day at a wretched pot-house on the road-side to obtain some refreshment. It was during Lent, but this miserable hovel was kept by a Jew, and he had therefore flesh, as well as fish and herbs, to offer to his guests. "What will you eat?" said the host to the thieves—"fish or flesh?" "What!" said the matricide, "eat meat in Lent? Dog of a Jew! I have killed my mother, and would kill my father too, rather than eat meat in Lent." A journeyman carpenter, who was at work at my house, asked for some bread; the servant gave him half a loaf: he took it, but knowing that we were foreigners, asked, before he began to eat, whether we fasted? She answered in the negative. "Oh, then," said the man, "take back your bread: nothing would tempt me to taste it."

Easter eve is looked forward to with great impatience, and twelve o'clock on that night with infinitely more eagernesss than the hour of sunset is in the Ramadan. Long before midnight the steps of the churches, and the roads leading to them, are crowded with people laden with eatables of all kinds, which must be blessed by a priest before they can break their long fast. Every one brings something, according to his means, and the poor hoard up every copeck during Lent for this occasion. There is, of course, a great variety in their offerings; the rich bring sucking-pigs and lambs, confectionery, poultry, and hams, while the serfs have loaves of bread, cakes, and hard eggs. Most of these are decorated with ribbons and flowers; the eggs are generally of various colours, usually red, but some are gilt, and have saints, and all kinds of patterns, painted on them. Many bushels are frequently collected in one house; they are boiled hard, and no one goes out without a few in his pocket, to keep up the following singular custom:—

Ivan and Alexis meet in the street; the two friends stop, and each pulls out an egg; the former holds his in the hollow of his closed hand, in such a manner that the small end only can be seen; this Alexis endeavours to break, by tapping it with the end of his, but not by any means in a hurry, for a good deal of manœuvring is shown on the occasion, and it is some time before Ivan has arranged his to his mind. At last, all is ready, and his friend gives the fatal blow. The one whose egg is broken loses; the victor pockets both, and says, "Christ is risen;" the other replies, "He is indeed risen." They then take off their hats, kiss three times, make a most profound bow, and part, to repeat the same ceremony at the corner of the next street. Another great event of the day is a general change of linen; the mujik puts on a new pink shirt, which lasts him till Easter comes round again.—*Captain Jesse's Notes of a Half-Pay.*

RISING IN THE WORLD.

What is rising in the world? Here is all the difficulty. Is it for the prosperous man to move in a bigger house, and patronise tailors, milliners, and upholsterers, and give splendid entertainments? This may be perfectly allowable and proper, as the reward and natural consequence of industry and frugality; but it is not rising in the world. The only way to rise in the world, even for the prosperous man, is to cultivate his mind and manners, and educate his family. It is not to set up his carriage, though this may be perfectly allowable, if he can afford it. It is not to resort to this or that watering-place, though there is no objection to his doing that, if he pleases. *It is to raise himself and family in the scale of moral and intellectual beings.* It is not to bring up his sons in idleness, under the preposterous notion of making them gentlemen, and in so doing make them fops and dandies instead of men, and thus prepare them for squandering his estate much faster than he amassed it. It is not to educate his daughters with merely showy accomplishments, and with the expectation that this world is to be as a show, and life a holiday. The best symptom of rising in the world that he can give, is to despise the follies of society, to set at naught the despotism of fashion, to perceive and resist the absurdity of a business community following in the footsteps of the aristocracy of Europe. It would show hopeful signs of rising above the vulgar, both great and small, if he should refuse to countenance the nonsense of turning night into day, and day into night.—*Burnap.*

TEMPERANCE.

Gouty affections are as much caused by excess in eating as by intemperance in drinking: the quality as well as the quantity of the food should be attended to. Persons who are in the habit of frequently dining out, can never be effectually cured of this disease. The system pursued by a dog doctor in Paris, is the best that can be adopted for the prevention of gouty affections. Ladies bring their lap-dogs to him in their carriages, and say their pets are unwell, and they know not what is the matter. The man locks the dogs up in an airy room, gives them some water, a little bread, and a dry bone to pick. By way of exercise, he makes them skip about, two or three times a-day, by means of a little horsewhip dexterously applied. At the expiration of a fortnight he takes them home to their mistresses, well, active, and hungry.—*Polytechnic Journal.*

THE PRIVATE PURSE.

BY MRS S. C. HALL.

PART I.

"TELL my niece, Miss Geraldine—I mean, tell Mrs Leeson—that as soon as she has put off her bridal and put on her travelling dress, I wish to see her," said Mrs Gascoigne to her maid, who had not answered her bell until she had rung it twice.

"Yes, ma'am," replied the flushed maiden, who was bowed out with white satin ribbon, as if she too were just made a bride.

"And listen—When all this mummery is over, take off these white fal-lals, and lay them by; they will do for the next fool of the family who chooses to enter the 'holy bonds'—ah! ah!"

The servant hardly murmured "Yes, ma'am" to this, nor had she quite closed the door on the crackling laugh of her mistress, when she muttered, "Well, that beats all! She to come on a visit to her own sister, on her niece's wedding-day, and grudge me wearing of the ribbons that cost her nothing! But it's just like her! Stingy!—augh! It's no use talking—I can't a-bear stinginess. I wonder why she could not stay below at the breakfast like other Christians; but it's none of my business. Put by the ribbons, indeed, that never cost her a brass farthing!" A group of ladies passing from one room to another interrupted this soliloquy, and turned the rippling current of the waiting-maid's small mind from meditation to observation. In an instant she became spell-bound by the white roses that garlanded the bridesmaids' bonnets.

Mrs Gascoigne, a lady of some five-and-fifty years, who had been a wife for a year and a widow for ten, was occupied after her own fashion. She was seated at a table in her dressing-room, and upon it was her open desk. Her long narrow features were pinched into a mean expression; her hair grew thinly above her brow; and yet it was short and frizzed, as if it had not the heart to grow long. Her lips were thin and compressed, betokening, however, secrecy rather than firmness. I have noted ugly mouths, still of a bland and generous formation; but I never saw a mouth like Mrs Gascoigne's that was not indicative of meanness and subterfuge. Her eyes were fine—that is to say, well set, and of a good colour; but their expression was unpleasing—it was sharp and suspicious. Her dress was neither good nor becoming, and she had flung aside the silver favour indicative of the motive that had drawn her from her own home. A faded purse of blue and white was between her fingers, and into it she had dropped some guineas—not sovereigns, but old-fashioned golden guineas—which she had, as it were, purloined from her own desk. She shook them once or twice, and an unconscious smile disturbed the gravity of her face—it was evident that she loved the golden chimes. Then she picked one out, and put it into its secret hiding-place in her desk. "Forty-nine," she said to herself—"forty-nine will go as far with a foolish girl as fifty; but it's an odd number—she may wonder why it was not fifty." Another was taken from the purse and returned to the drawer. A moment's pause—she looked out a third, a fourth; weighed it for a moment on her well-practised finger—it was a thought light, so she exchanged it for one that pleased her better, and it was dropped into the hoard. Another—she chinked the purse again. "Forty-five good guineas—forty and five," she repeated—"hum! quite enough to commence a private purse for the wife of a young banker;" and she shut it to with a determined snap.

"May I come in, dear aunt?" said a sweet voice at the door—"may I come in?"

Until the desk was shut and locked she made no answer; and then, affecting not to have recognised tones the sweetness of which told upon every ear, as the joy bells sound upon the summer air, she inquired, "Who is there?"

"Me, aunt—Geraldine," answered the same music.

"Oh yes, dear, come in," said Mrs Gascoigne. For a moment she looked with pride upon the young and lovely being who had that day committed her entire destiny into the hands of one who had promised, with his whole heart and soul, to "love her, comfort her, honour and keep her in sickness and in health; and, forsaking all others, keep him only unto her so long as they both should live."

"Why, dear," exclaimed Mrs Gascoigne, as the mind returned to its old habits, "what a deal of money that dress must have cost! it is a real pity to hack it travelling—a real pity. Dear Geraldine, have you no turned silk you could wear on the journey?—eh?"

"You know, aunt, I brought Henry no fortune, so mamma thought the least thing I might have was a handsome wardrobe;" and she looked as much annoyed as she could have been with any thing on such a day.

"Ah, dear—well, that's true; I suppose your poor mother scraped together all she could to make up the trousseau, and has no little purse to give you, eh?"

"My dear mother," replied the bride—and the ready tears rose to her eyes—"has indeed done every thing to make me happy—I was going to say independent—but every woman is dependent upon her husband; and Henry is so gentle and affectionate, I have no fear that he will make me feel he was rich and I was poor. Mamma gave me ten guineas, and," added the fair girl (she had not numbered nineteen summers), with a proud air, "it will be a long time before I spend all that."

"That's my own Geraldine—keep it, dear—don't spend it—keep it. Gold grows by the keeping; it does not rust or mildew—keep it; it is power—all that man or woman wants. I know that—by wanting it, Geraldine. Ay, you may smile, and I daresay your mother and all of them think it not true: poor Mr Gascoigne left me enough, but no more. You, Geraldine, were my god-child—called after me—and I must say that you have been as good and as affectionate as if I had made you a present every birthday, which, perhaps, I might have done, had I not been afraid you would have married your cousin Arthur Harewell."

"My dearest aunt!" ejaculated Geraldine, in a tone of surprise.

"Oh, yes! I know he was very fond of you; but I hate every one of the Harewells; they are as poor as church mice, and yet as proud of their intellect as if they had been every one city members. Now, my dear, I am going to tell you a secret, which I must not have you tell Henry; your own secrets you may tell him, if you are foolishly fond of talking, but as this is *my* secret, you have no right to tell it."

"No," said Geraldine, somewhat hastily, "I will not tell him your secret, aunt. I have no right to do that, I think."

"Certainly not, my dear; all men have odd notions, and it is a foolish thing to tell them every nonsense; it makes them think little of us women, to keep up a tittle-tattle about every trifle."

Geraldine gave no reply to this. She had made up her mind to tell Henry every thing; this was her own right-minded impulse; for her mother, a quiet, amiable, fashionably-thinking woman, fancied she performed her duty when she sent Geraldine to a boarding-school, heard her play and sing, and saw her dance during the vacations—restricted her own expenditure in all things that she might have the best masters, and be as well dressed as girls who had ten times her fortune—a sure way to enfeeble the mind—took it for granted, that, as she knew her catechism, had been confirmed, and went every Sunday to church, her religious education was such as to befit the high calling of a Christian—and had never spoken to her of the duties a woman is called upon to fulfil as wife and mother, until about a week previous to the wedding-day, when she told her to be affectionate and forbearing, and "not to forget her own dignity." Something she added about the duties of a mother, and the advantage of cold bathing for infants; but quickly concluded by saying that there would be "time enough to think of that." No wonder that Geraldine was unable to reply to her aunt's commonplaces, and at once unravel their fallacy and penetrate their danger. There are, to my knowledge, at this moment, when volumes on female education pour from the press—when national education is rendering the lower superior to the higher class in solid and useful knowledge—there are scores of well-intentioned ladies, gentlewomen by birth and in manner, who love their daughters, who would (if they knew how) forward their temporal and eternal welfare in every possible way—and yet do no more than Geraldine Leeson's mother did. When shall we have a school for mothers?

Mrs Gascoigne resumed the broken thread of her discourse more quickly than I have finished my digression.

"Well, my dear Geraldine, I have here a little present for you—just enough to prevent your running to your husband's pocket every moment; but *you must not tell him a word about it*—it is *my* secret. If he or your mother were to know I had scraped together fifty—no, five-and-forty—guineas for you, they would expect me to go on giving; and the more you give, the more you may. So, take it with my blessing, child, and take care of it; *spend it secretly* for any little thing you may want, and say nothing about it."

Geraldine was really surprised and pleased; she had never in all her life had so much money of her own, and least of all had she expected it from her "stingy aunt." She reiterated her thanks most sincerely; and little thought she had taken the first step towards deceiving her husband and working her own misery.

"Remember," repeated Mrs Gascoigne—"remember, it is my secret, and you have *promised*; you cannot conceive how I should suffer if you broke your word." Again Geraldine kissed her, and bade her affectionately farewell—not before she had been twice summoned by her bridesmaids.

"I *might* as well," said this dangerous monitor, as she took her seat by the window to observe the departing carriages—"I might as well have taken back that odd five; and then the ten her mother gave her would have just made up the fifty. I hope she'll take care of it, poor dear child! There she goes, and her cousin, Arthur Harewell, handing her in! Well, I shall conceive it my duty to give Henry Leeson a hint to look after his pretty wife when Master Harewell is in the way. It is a very queer world we live in!"

The people who make the world "queer," as they call it, are the first to complain of this queerness; and so it was with Mrs Gascoigne. Her own marriage had been entirely dictated by interested motives. She married a rich old miser for the sake of his wealth, when she was past forty; and upon her "queer" ways his "queer" ways became engrafted. Geraldine's match pleased her, *because* Mr Leeson was rich; and

she fancied her god-child had inherited her disposition, *because* she had discarded a poor cousin, whom she believed, erroneously, she loved, and married a wealthy man, whom she, as erroneously, believed she did not love. If Geraldine *had* chanced to like and wed her poor cousin, Mrs Gascoigne would never have given her five-and-forty pence.

Geraldine Leeson had escaped many of the contaminations of a public school, from a sincere desire to learn thoroughly whatever she undertook; consequently she had little spare time. She knew the sacrifices her mother made that she might become accomplished; and besides, she loved her home dearly and devotedly. She had not left it as early as many children do, so that the home affections, if not full-grown, had taken root before her departure into a community as varied and as dangerous as that of all large schools must be, until their entire system is thoroughly regenerated. Still, as this was a "finishing school," she could not but hear various speculations, on the part of many of the elder girls, as to "when they should come out." How anxious the mamma of one was to get papa into good humour, to spend a winter in Paris—whether he could afford it or not—because her cousin had made an excellent match there; to be sure, the gentleman thought at first, from the style they lived in, that they were very rich, but he knew the difference now; and the other girls laughed at this, and exclaimed, "What fun!" Another mourned bitterly "papa's stinginess," and how *her* poor mamma was obliged to alter the house bills to make them appear more than they were, or else they never could have any thing fit to wear; while a third rejoiced that such never could be the case at home, as *her* mamma's pin-money was secured, and she did as she pleased without consulting any one! All this sort of poisoning is carried on, like all poisonings, secretly: I do believe that few women, undertaking the charge of youth, would suffer such observations to go unreproved; but no governess can have ear and eye for fifty, or even five-and-twenty, "grown-up" young ladies, who are permitted to sleep, four or two, in the same room, and to walk attended by foreign teachers, who frequently do not understand the language spoken by their pupils.

Geraldine had escaped systematic corruption; she loved music and dancing for their own sakes, and never cared a great deal for creating a sensation. She, of course, desired to be loved; but she never degraded affection by calculation. She would have paused, certainly, before she wedded poverty; but she would not have married simply because her lover was rich. So far she was tolerably right; but, unfortunately, many mothers, and hers among the number, have confused notions as to the boundaries of the delicate and indelicate. If love is mentioned, instead of impressing the young mind with a just idea of its sacred nature, its holy attributes, its natural impulses, it is dismissed with an "Oh fie!" or a reproving look, which at once assures the daughter that her mother cannot be her confidant, and thus a mother loses a stronghold in her child's mind; whereas, making it the subject of conversation, speaking of it as an event on which much of the happiness or misery of after-life depends, would strengthen the reasoning powers against its undue influence, and, while subduing its violence, lead to its being considered in its more holy and sacred bearings.

Geraldine's mother would have almost blushed herself at mentioning a husband to her, in the abstract; and yet she could not fail to perceive to what the hint of, "Geraldine, wear your blue and white, and let Esther dress your hair; I want you to look particularly well to-night" tended—for this was done when only one eldest son was expected to "come in and try his new flute." How much of the dignity of truth, with which every British mother ought to be crowned, is sacrificed to those petty arts; how much misery ensured, by domestic duties feebly sustained!

"I hope," said her mother—"I hope and pray you may make a good wife;" and she meant what she said, but she had never adopted the means to make her one.

Geraldine read over the marriage ceremony, thought for a moment how harsh that word "obey" sounded, then wondered she had thought so—"it would be so easy to obey one she loved as she loved Henry—obedience would be pleasure;" and so she closed the book. Her nature was very timid. She had little strength of either body or mind, but she had much affection, a gentle yielding temper, and wished to do right in all things. Her husband had settled a handsome independence upon her in case of his death; but the idea of wanting any thing while he lived she had put far from her. Although induced by her selfish aunt to promise not to mention her fatal gift, it had never entered into her head that she was doing wrong in keeping a secret from her husband.

Six months had elapsed since Geraldine became the wife of Henry Leeson. She was established in a pretty house at the "West End;" had a chariot of the newest build, a pair of unexceptionable bays, a very tall footman, and a very little page; went sometimes to the opera, presided at a small dinner party, and assisted at a soirée, with infinite propriety; and so liberally had her husband ministered even to her fancies, that she had only spent five guineas of her store. She had told him of her mother's gift, but remained silent as to her aunt's. Her cousin had come to town to "keep his terms," and her aunt had succeeded her mother as an inmate for a month. "The season," as it is called, had commenced; and if it had not been that her aunt's presence damped her spirits, she would have been as happy as any wife could be. Her husband never was late at his club, and, like most junior partners in a bank, did not remain at his counting-house longer than was absolutely necessary.

One evening, soon after the aunt and her niece had taken their places in front of a private box at Covent Garden—for they did not move in the very high sphere which eschews English theatres altogether—Henry, leaning over his wife's chair, exclaimed, "Why, Geraldine, what a handsome chain! I have not seen it before. Where did you get it?"

"I bought it, love."

"When?"

"Oh! let me see—this week."

"This week! and never consulted me! I hope," he added, looking somewhat serious, "that it is paid for."

"Of course it is, Henry. Why do you ask?"

"Because that chain must have cost twenty-five guineas at least; and you know, last week you shook your empty purse at me, and I put only ten guineas into it. Where did you get the money?"

Her aunt contrived to press her foot, as a warning. "I told you mamma gave me ten guineas when I left home."

"But you told me how you spent five of that at Cheltenham. We young bankers understand subtraction."

"Well, then," she replied, colouring with confusion, "if you must know, mamma made me up the money, as I fancied the chain."

Mr Leeson bit his lip. "Indeed!" he replied; "she is richer than I fancied."

"It does not need a mother to be very rich to give a child ten guineas even for such a toy as this," she said, flinging the links over her pretty shoulder.

"Certainly not, my dear; but riches are comparative. One person is rich with a pound, another poor with a thousand." He looked serious, even stern for a moment, as if something very unpleasant was presented to his mind; and then his fine animated face brightened up, and he added, "I hope my little Geraldine has not made a private purse!"

She could not reply; she felt agitated, degraded; she had told a falsehood, and one likely to be detected. The performance passed unheeded; she tried to smile, but, instead of smiling, burst into tears. Mr Leeson had not been long enough married to slight a wife's tears; he withdrew her from the front, and thought he had spoken harshly, when he had only spoken seriously; he caressed and apologised, and every affectionate word he spoke added to her self-reproach. Soon after, her cousin entered the box: his manner was only that of most animated young men, light and careless, with an occasional *empressement*, rendered more striking when contrasted with his ordinary trifling. Still, that manner was the one, of all others, her husband disliked most. Nor had Mrs Gascoigne's injudicious hint been wanting, to increase the antipathy he had felt towards this well-intentioned but frivolous young man, from the first. Arthur Harewell used a cousin's privilege to the full; inquired—Henry thought more tenderly than was necessary—after her health, then rallied her on her seriousness, talked the usual quantity of nonsense, which women, who know any thing of the world, understand to be matter of course, and then offered some observations on her dress. She complained that the chain had an unsafe clasp, and he offered to take it to the jeweller's to get it repaired—conveying the idea to Henry's mind that he knew where it had been purchased. Mrs Gascoigne, who hated every one of the Harewells, did not fail to cast in as many inuendoes as she could, to annoy the young barrister, who had too much tact to retort on an elderly rich relative, yet became gradually irritated by his own forbearance. Geraldine was so unhappy as to seem constrained; Henry grew snappish and morose; and the only one of the party who seemed contented with the evening's proceedings was Mrs Gascoigne. Not that she acknowledged a wish to make any one, particularly her god-child, unhappy; but, like all other discontented people, she did not quite understand why any thing in this world should go smoothly forward, and it was consolatory to imagine that others were as uncomfortable as herself. There are persons in this world who derive much consolation from the belief that many are more unhappy than themselves. Geraldine was unaccustomed to deception; as long as the five-and-forty guineas had lain dormant in her desk, there was no visible proof of their existence, and she had no temptation to deceive; but the chain coming so palpably before her husband's eyes, had changed altogether the nature of the case, and called her deceptive powers into action. She was, however, a bad actress, and felt so. Her impulses were good.

"I will not," she said, "run a second risk; I will return my aunt her twenty guineas, and not suffer myself to be again tempted: I was fortunate to get off so well last night." She took out the money, and entered her aunt's room.

"You look pale enough," was the morning salutation she received; "and truly, my dear, I am not astonished at it. Mr Leeson's conduct was very harsh to you last night, and, I confess, I thought rude to me; yes, dear, rude to me—to fly into a passion about a trumpery chain, because, forsooth, *he* was not consulted—to ask if my niece and god-child had *paid* for what she wore—to inquire *how* she got the money—taunting you with your want of fortune."

"Oh, dear aunt, he never thought of that!"

"Permit me to know best, if you please, Mrs Leeson. If your mother had done as she ought, she would have stood out for pin-money, and not have left you the degrading task of dunning your husband for every little foolish thing—turning men into *molly-cots*—Ah! you may smile if you like, Geraldine; the phrase is not very elegant, but it is very expressive—you will allow *that*, I suppose. However, you were no child of mine, or I would have managed differently, and taught you differently. Men change, my poor girl; and it is quite right for a woman to provide against that change."

"By a large stock of affection?" inquired Geraldine, half amused and more than half awakened by her aunt's theory.

"No, my dear, but as large a stock of cash as she can muster. Henry makes you an allowance for house-keeping; you do not spend it *all*, I hope?"

"No, aunt; he has given me great credit for good management. I saved nearly five pounds out of my first month's allowance."

"And you told him so?"

"I certainly did. Now, my dear aunt, why do you look so? Where would have been the pleasure of saving without his praise? I saved five pounds, and gave it him."

"And he took it?"

"Yes; of course he did."

"And after that to speak so meanly about the chain! (which, to confess the truth, was a bit of extravagance; but he did not think that)—a pretty clear proof that he expects you to consult him on every inch of ribbon. Don't be a fool, Geraldine. I know the world, and I know that the more you give in, the more you may. Why, you do not expect a *business-man*, such as Mr Leeson surely is, to suffer you to lay out *his* money for what you may fancy?—he knows how money grows out of money too well for that. No; make up your mind to one of two courses—either be content to sink into an upper servant, spending your month's allowance upon the house, and giving in your honest account, or do as I did—as other women do—and keep a little for yourself; you do not know how you may want it; and, from the fuss he made last night about that stupid chain—in public, too—I think you may very easily judge that he intends to draw the purse-strings tight; and you looked all the night as penitent as if you had committed a crime. Well, well, you will know better. I once knew a woman who managed to scrape a purse together so cleverly, that, when her husband got into difficulties, she was able to provide all sorts of little comforts for the house, without the knowledge of the creditors."

"But was that honest?" inquired the young wife, "as it was saved out of his means."

"But surely he intended it to have been spent?"

"Yes, very likely," replied Mrs Leeson, who was musing on her husband's rudeness; and then she added, "Yet such a system destroys mutual confidence."

"My poor foolish child!" retorted her aunt, with an ominous shake of her head—"My poor foolish child! you do not surely believe that your husband tells you every thing—makes *you* a confidant! A handsome, would-be-fashionable young man make his wife his confidant!—tell her every thing! Why, what a fool you must be!—ah ah!" and the old crackling laugh grated on Geraldine's heart. "By the way," resumed the adviser, "who was with you when you bought that chain?"

"My cousin."

"Oh! and you told Mr Leeson that, too, I suppose."

"No, I did not; but I would in a moment, for I saw no harm in it."

"Well, my dear, *he would;* he's as jealous as a Turk. I would not wonder if he thought that Arthur Harewell had given you that chain."

"I told him mamma gave me the money."

"Oh! ah! so you did; I daresay he thought her a great fool, for he must know how little she has to spare; however, dear, there's an end of it now. Take my advice—do not invite Arthur to the house yourself, keep what money you have safely, and add to it whenever you can. You'll find Henry, with all his love, will draw the purse-strings tighter and tighter every year; it's always the way with those business-men: and men of independence are just as bad in the other way, they draw in to meet their own greedy extravagance."

Geraldine was so confounded by the variety of new ideas—the suspicion that she did not possess her husband's confidence, that he insulted her by his jealousy, that let her be as confiding as she would, she would meet with no return, that he was, or would be, avaricious, not from want but caprice—all caused her such pain, that she retired to her room to find relief in tears, without returning the remainder of her money. If she had preconceived notions upon the subject—if her mind had been decided that, *let her husband's conduct be what it would, her duties, solemnly pledged at the altar, remained the same,* all would have been well. But, poor thing, she had no fixed principles to build on. Her cousin called a couple of hours after, and she did not ask him to dinner. When her husband returned, he found her languid and cold, with an indescribable air of offended dignity; whereas he, on the other hand, felt constrained and afflicted at a duplicity he had discovered for the first time. If *either* had confided in the other, how much after misery would have been spared to both!

Mr Leeson heard from the footman that Mr Harewell had called, and thought it was odd his wife did not as usual mention his name, with those of two or three other visiters; then he asked her abruptly, "Why she had not detained her cousin Arthur to dinner?"

Her aunt's insinuation as to her husband's jealousy immediately occurred to her, and she stammered and blushed so as to recall vividly to his mind the young man's frivolous manner on the preceding evening; and the consequence was, that both felt exceedingly unhappy.

It is not to be wondered at that Mr Leeson suffered a good deal of anxiety; for it so happened he had discovered that his wife's mother was exceedingly distressed for money before she had quitted his house to return to her own; and, with a delicacy which deserved increased confidence, he had placed a sum at her disposal as she was leaving London, intreating her not to mention it to Geraldine, lest the shadow of obligation might give her pain. The old lady thanked him with tears of gratitude, confessing that she had wished to borrow a few pounds from her daughter, but thought it better not, lest it might lead to uncomfortable feelings. This proved to him that his beloved wife—she whom he loved with all the passion of a strong, truthful, and fervent affection—she in whose simple purity he trusted, and would have trusted for ever—had deceived him by a mean falsehood. If she had not returned him the five pounds already mentioned, he would again have taxed her with forming a private purse; but that act militated so strongly against such a supposition, that he repudiated the idea for one far more painful—he believed she had either

accepted the chain from her cousin, or borrowed the money from him.

Henry Leeson's nature was none of the softest. He entertained the highest possible sense of female honour. Whatever the fact might be, he boasted of always making his affections subject to his reason. And on that same evening, when they were alone, he said, after about twenty minutes had been spent in a restless and painful dialogue, in which neither were explicit, yet both saw that something remained untold—he said, sternly, for the fair and gentle face he looked upon had lost the radiance of truth, "Thus much, Geraldine—thus much; beware at any attempt to deceive me; for, if you do so once, you will never do so a second time."

The young wife wept, and wept bitterly; but though only four-and-twenty hours had elapsed since he dried her tears so anxiously, yet then he had not thought, and calculated, and placed one circumstance with another, to see how they tallied; and he had clung to the hope that she would have frankly told the truth when they were alone—he had pictured her with her pale weeping face, he had framed the gentle counsel, and heard the fond promise; he had hoped even that she had gone in debt rather than have been obliged to any man for a golden gift, which she feared to confess. Her aunt's extreme niggardliness prevented the supposition that she had bestowed any thing upon her save what even misers give—advice. Yet little did he imagine what the nature of that advice would be. Young men in general are careful enough as to what male society their wives mingle with; but they ought to be even more careful as to the female. A woman is on her guard amongst men, but amongst women her heart and ears are both open; yet what pernicious notions may she not imbibe from that dangerous class of persons called "women of the world."

It would be almost impossible to trace how one small suspicion grew out of another; how Geraldine's heart heaved and ached under the consciousness that her husband regarded every thing she did with a prejudiced eye, and listened to her words with a jealous ear; how, having asked him for some fancy of hers, when he was in a mood not to grant a favour, he refused; and her aunt, who unfortunately happened to be present, took occasion to exult in the truth of her evil prophecy.

"You see, Geraldine, I was right; every husband grows selfish sooner or later; and a poor woman who has no spirit is sure to be trampled on—never has a shilling to spend on herself, unless *she manages*."

Geraldine had no broad ideas as to the duties of wedded life. She, happily for herself, had never thought of discussing the rights of women apart from the rights of men. She did not seek to disturb the beautiful harmony of nature, by setting up the weak against the strong—by endeavouring to reason a woodbine into becoming an oak; but she did think sometimes that as the oak did not afford much generous support to the woodbine, the woodbine might manage a little artificial support for itself. So she fell, by degrees, into her aunt's plan. She stinted the house to fill her private purse, and this narrowness rendered his home any thing but comfortable to her husband; but even this was not the worst. She, who had felt and mourned over her first untruth with so much real bitterness of spirit, had become accustomed to falsehood; it was necessary to tell one little lie to hide another; the holy beauty of truth had altogether departed from her. Whenever her conscience reproached her, she whispered to it "that she could not help it—that if Henry had continued the Henry he was at first, it would have been different—that it was his fault—that he was severe—that he had grown suspicious—that as he often blamed her without a cause, she might as well have a little of her own way as not—that he was frightfully stingy." It was impossible for any one to have proceeded in this course, without becoming morally degraded; it is wonderful how slowly yet surely this degradation progresses; until, when a review of the past takes place, we are astonished that what *were principles* should *now* be called *prejudices*, and marvel at our past simplicity. Such were generally Geraldine's reflections. She almost smiled to think how she had blushed and trembled at an equivocation; but such smiles are only as gleams of sunshine on a sepulchre, and when they pass, woe, woe, for the rottenness within!

Arthur Harewell always came to London in term time, and sometimes remained until it had been long over. Henry Leeson would hardly confess to himself that he regarded him with suspicion; and yet, though they frequented the same club, walked together, went to the theatres together, and Arthur was the constant guest at his table, Mr Leeson was any thing but comfortable in his society.

In indulging this feeling, he did his wife gross injustice. She loved her husband, and practised no deception towards him, except on the one point; but it would have been next to impossible to convince him of this. She was universally admired; her loveliness was matured into beauty. She was never absent from her husband's thoughts for ten minutes together; and yet he was the only person who appeared indifferent to her.

Her memory was not always true to her falsehood: she often betrayed herself. She had lost her husband's respect. The vase was broken, and though much of the perfume remained, he did not seek to treasure it, but rather desired to have the power of turning from it altogether: each had a separate interest. And when he looked upon the only child God had given them—a girl—his heart sunk within him, "For," he said, "she will grow up a liar like her mother!" To do Geraldine justice, she endeavoured, strange as it may seem, to impress her daughter with a love of truth; but her ideas of right and wrong, in their bravest and highest sense, were confused—and precept in education is nothing worth without practice.

She had not seen her mother since the birth of her child, as she had been abroad from ill health. Her aunt visited her but too often, for she became, unfortunately, the depositary of her secrets, and still advised her to keep her purse closer than ever, as be sure her child, as she grew up, would want so many things its father would not give it.

It would be impossible to particularise the various instances of mistrust that occasioned so many bickerings between Geraldine and her husband; but they had led to this result—that, even when she spoke the truth, her husband did not believe her. A disbelief in her truth as regarded money matters, was not the only doubt that passed through and occasionally took possession of Henry's mind. He fastened upon her a careless impropriety of conduct, which was altogether apart from her nature; and never did she wear the chain which occasioned her first act of dissimulation, without its rendering him silent and morose. At last her mother, whom much sickness had made a wiser woman, came to visit them; and so great was the change apparent in both, that she resolved to probe its cause as far as she was able.

POPULAR INFORMATION ON FRENCH LITERATURE.

TWELFTH ARTICLE—DU BELLAY AND DE BELLEAU.

THE early portion of the sixteenth century witnessed the appearance of a constellation of poets in the hemisphere of French literature, to whom, in consequence of their number, was given the collective title of the Pleiad. Some of these were men of no slight ability, and their works still retain a high degree of popularity among their countrymen. Two of the most eminent were Joachim du Bellay and Remi de Belleau.

Joachim du Bellay was a scion of one of the most illustrious houses of Anjou. He was born in the year 1524, at the village of Liré, a place distant some few miles from the town of Angers. Being a younger brother, and left comparatively dependent, he sustained considerable neglect in youth; but this proved rather an advantage than the reverse, leading him into habits of self-culture, which did more for his education, it is probable, than any ordinary instruction could have done. He began in early youth to write verses, and speedily acquired the friendship of the great patroness of literature and merit in that age, Marguerite of Valois. It was to his relative, the Cardinal du Bellay, however, that the young poet naturally looked for special support and encouragement, and that influential prelate accorded it so far as to carry his kinsman with him on the same Italian mission which Rabelais accompanied. Joachim du Bellay, though disgusted with the profligacy of the courts of Italy, derived great benefit from his residence in that country, the study of her famous writers having improved and fixed his poetical tastes. His collection, "The Olive," amounting to above a hundred sonnets, has also reference chiefly to Italian subjects and persons, and is composed after the Petrarchan model, the olive being the chosen emblem of the French poet's love, as the laurel was of the Italian's. On the whole, the style of Du Bellay had much of the grace, ease, and sweetness of that of Petrarch, though his countrymen preferred to apply to him the title of the French Ovid.

Spenser, in an address to the French bard, exclaims—

> "Bellay! first garland of free poesy
> That France brought forth, though fruitful of brave wits,
> Well worthy thou of immortality!"

This last line alludes, it is probable, to a little piece on the "Immortality of Poets," in which Du Bellay, with that consciousness of desert which seems inseparable from the temperament of a true poet, boldly prognosticates for himself an immortality of fame. We cannot give a better specimen of his poetry, perhaps, than this very piece.

> While bravely some attempt to gain
> The honours of the conquering sword,
> And others, on a distant main,
> Seek to amass a golden hoard;
> For palace-smiles while this one longs,
> And that one courts the popular throngs;
>
> I, whom the Graces love alway,
> Contemn the gifts that these adore;
> I hate their honours of a day,
> Their cares that gnaw the bosom's core.
> Whatever pleases me is sure
> To be what crowds can not endure.
>
> The laurels of the ancient lyre
> Have given me fellowship with gods;
> And satyrs, full of gleesome fire,
> Chasing the nymphs to their abodes,
> Have made me love, in unsought spots,
> The holy gloom of their rude grots.
>
> I have the hope to roam the skies
> On pinions hitherto untried;
> And, ere a lengthen'd period flies,
> No more on earth shall I abide.
> From all the pride and strife below,
> Far above envy, shall I go.
>
> Beyond the Mississippi's shore
> From the bright day-dawn will I fly—
> From northern bear to black-armed Moor—
> The whitest bird of all the sky.
> I will not dread to leave this light,
> And enter on the last long night.
>
> I have no fear to die, as all
> Must do that breathe our mortal breath;
> Whatever part by death may fall,
> My better part shall mock his wrath.
> Wealth and ambition may have fear
> Of death, for they have life but here.
>
> Away with the funereal song!
> Away with portraiture and bust!
> My ashes are not those that long
> For the vain honours paid to dust,
> Which but for some brief years can keep
> Their memory from oblivion's deep.
>
> Though to the vulgar herd unknown,
> My name shall not unbonour'd be;
> The sisters of Mount Helicon
> A sepulchre have given to me,
> Which nor the potent tempest fears,
> Nor the long course of passing years.

Besides the works mentioned, Joachim du Bellay was the author of rural pieces, called *Vœux Rustiques*, *Visions*, many small pieces, a work on the French language, and some Latin poems, not held in the same esteem with his others. It would be unwise not to take advantage here of such a translator as Spenser, when we have it in our power. The following sonnet was rendered by him into English, and gives one of the picturesque pieces of description that appear in Du Bellay's Visions:—

> "On high hill top I saw a stately frame,
> An hundred cubits high by just assize,
> With hundred pillars fronting fair the same,
> All wrought with diamond, after Doric wise;
> Nor brick nor marble was the wall to view,
> But shining crystal, which, from top to base,
> Out of her womb a thousand rayons threw
> On hundred steps of Afric's gold enchase;
> Gold was the parget; and the ceiling bright
> Did shine all scaly with great plates of gold;
> The floor of jasp and emerald was dight.
> Oh! world's vainness! whiles thus I did behold,
> An earthquake shook the hill from lowest seat,
> And overthrew this frame with ruin great."

A relative high in the church, Eustache du Bellay, Bishop of Paris, obtained for the poet a canonry in the church in the year 1550. But he did not live long to enjoy the benefit of earthly possessions after his return from Rome. At the very early age of thirty-one, Joachim du Bellay was cut off by apoplexy. The date of his decease was January 1555, and he was interred in the church of Notre-Dame.

Of the cotemporary of this poet, Remi de Belleau, we have now to speak. He was pre-eminently the poet of love and nature. Little else is known of his private life, save that he was born at Nogent le-Botron, in Le Perch, in the year 1523, and that he was patronised by René de Lorraine, Marquis d'Elbeuf, whose son was confided to his tutorial charge. Afterwards Belleau, as was customary, went to court and gained favour there. When Charles IX. could not sleep on account of the haunting visions of the victims of the Eve of Bartholomew, the poesies of Remi Belleau were pleasing to him in a particular degree, and, above all, a "Discourse of Vanity, taken from Ecclesiastes," in twelve sections. This is a well-versified work, though without much other merit. "Sacred Eclogues," from the Song of Songs, may be summarily dismissed in the same way. But the largest work of Belleau was one entitled the "Loves and New Transformations of the Precious Stones." This work has a resemblance in plan both to Darwin's Loves of the Plants and Ovid's Metamorphoses. Take, for example, the fanciful story of the origin of the Opal stone as given by Belleau. Iris, the many-coloured messenger of imperial Juno, is sent on some errand to earth. By the banks of the Indus she stays a while to refresh herself, and there falls in love with Opalle, a beauteous shepherd. He is so much struck, too, with the charms of the celestial envoy, that he swoons away; but he recovers, and, in converse with him, Iris forgets Olympus and all that it contains. The impatient Juno searches for and discovers her; when the mortal cause of the forgetfulness of Iris is changed by the angry deity into a stone. The lamenting Iris cannot undo the charm, but she blends together some of her rainbow rays, and, bestowing them on the stone, converts it into Opal.

Our readers will readily see, that, though the poetry may be fine, no human interest can attach to such stories. Even Ovid's tales have more of the latter quality, in as far as real human beings are supposed by him to be the parties metamorphosed. But where all is fictitious and factitious together, the matter must be cold and dry indeed. Like Darwin, Belleau has only wasted his ingenuity. For our present purposes, however, it is fortunate that, in so many instances, the poets under notice should have left the most favourable specimens of their powers in the form of small pieces. Here is such a piece from the mint of

Belleau. The object of this aspiration is to entreat Astræa, or the Star of Peace, to return to France.

Fair Astræa, quit thy sphere,
Thou, so long'd for in our clime;
Come, and make thy sojourn here
For a time!
Civil flames have now too long
Coursed our towns and vales among,
Stirring wrath and whetting swords;
Long hath famine gnaw'd our hoards;
Pestilence, and ruin's darts,
Long have lost us thy sweet arts.

Tempests do not ever roar
In the trembling pilot's ears;
Rocks do not on every shore
Wake his fears.
Thunder, terrible and loud,
Comes not always from the cloud,
Nor the flashing, nor the flame;
Ofttimes will the storm grow tame,
And the gloom will disappear,
And the clouded sky be clear.

Show to us thy lovely face,
At this season fresh and new;
Let us, for sweet ruth, find grace
In thy view.
Let, beneath thy honour'd hand,
Golden grain re-deck the land!
Come, more gracious than the star
Which directs the solar car,
When the god on the void air
Shakes abroad his golden hair!

When thy coming is at hand,
Let the heavens pour on the winds
Odours sweet and perfumes bland,
Of all kinds,
With honey and with manna showers;
So that this fair France of ours
May enjoy a beauteous spring,
To which time no end shall bring,
Nor the changes that have birth
On this fickle, shifting earth.

Having nothing further of interest to give relative to the career of Remi Belleau, save that he died in Paris in 1577, we are the more pleased at having it in our power to present another and concluding specimen of his verses, rendered by an able hand in the London Magazine for April 1822—a publication of so high a character that its brief career is much to be regretted. The piece alluded to is a Song on April.

"April, sweet month, the daintiest of all,
Fair thee befall:
April, fond hope of fruits that lie
In buds of swathing cotton wrapt,
There closely lapt,
Nursing their tender infancy.

April, that dost thy yellow, green, and blue,
All round thee strew,
When, as thou goest, the grassy floor
Is with a million flowers depeint,
Whose colours quaint
Have diaper'd the meadows o'er.

April, at whose glad coming zephyrs rise
With whisper'd sighs,
Then on their light wing brush away,
And hang amid the woodlands fresh
Their airy mesh,
To tangle Flora on her way.

April, it is thy hand that doth unlock,
From plain and rock,
Odours and hues, a balmy store,
That breathing lie on nature's breast,
So richly blest
That earth or heaven can ask no more.

April, thy blooms, amid the tresses laid
Of my sweet maid,
Adown her neck and bosom flow;
And in a wild profusion there,
Her shining hair
With them hath blent a golden glow.

April, the dimpled smiles, the playful grace,
That in the face
Of Cytherea haunt, are thine;
And thine the breath, that from their skies
The deities
Inhale, an offering at thy shrine.

'Tis thou that dost with summons blithe and soft,
High up aloft,
From banishment these heralds bring,
These swallows, that along the air
Scud swift, and bear
Glad tidings of the merry spring.

April, the hawthorn and the eglantine,
Purple woodbine,
Streak'd pink, and lily-cup, and rose,
And thyme, and marjoram, are spreading,
Where thou art treading,
And their sweet eyes for thee unclose.

The little nightingale sits singing aye
On leafy spray,
And in her fitful strain doth run
A thousand and a thousand changes,
With voice that ranges
Through every sweet division.

April, it is when thou dost come again,
That love is fain
With gentlest breath the fires to wake,
That cover'd up and slumbering lay,
Through many a day,
When winter's chill our veins did slake.

Sweet month, thou seest at this jocund prime
Of the spring-time,
The hives pour out their lusty young,
And hear'st the yellow bees that ply,
With laden thigh,
Murmuring the flowery wilds among.

May shall with pomp his wavy wealth unfold,
His fruits of gold,
His fertilising dews, that swell
In manna on each spike and stem,
And, like a gem,
Red honey in the waxen cell.

Who will, may praise him; but my voice shall be,
Sweet month, for thee;
Thou that to her dost owe thy name,
Who saw the sea-wave's foamy tide
Swell and divide,
Whence forth to life and light she came."

THE MISERABLE CLASSES.

The residuum of unutterable wretchedness which exists at the bottom of nearly all our large city populations, is beginning to attract the attention it deserves. We have received a letter respecting that of Glasgow, from Mr George Greig, travelling secretary to the Association for the Protection of Young Females, who has recently visited Scotland for the first time, in the course of a tour for the purpose of establishing provincial auxiliaries to the society of which he is an officer. Conceiving that the judgment of a stranger on this subject may be useful, we gladly give admission to Mr Greig's remarks:—

"Whilst lately on a visit to Glasgow, engaged in a most important and benevolent mission, I was so painfully impressed by the glaring contrast presented by the social condition of different portions of its vast population, that I determined, on my departure, to seek, through the medium of your Journal, for an opportunity to bring before the attention of the right-thinking part of the community some of the fearful evidences which have so powerfully operated upon my own mind. In the following statement of facts, I am not at all led by a desire to select Glasgow as a place especially distinguished by such scenes, believing as I do that, to a slight extent, that city is equalled by most of the large manufacturing towns of England; whilst I have no doubt facts of a similar character might be obtained in all the large towns of Scotland; and, from actual observation, I know that Edinburgh presents similar scenes to an almost equal extent. I have been induced, however, thus to publish the result of my personal investigations in Glasgow, because, from a knowledge of the enlarged Christian benevolence which actuates many of her citizens, I have a well-founded hope that, possessing as they do the means of lessening, if not of eradicating, the great evil of which the following narration presents but a faint though truth-telling picture, they will proceed to the employment of some effectual remedy.

The first miserable feature of the social condition of Glasgow that particularly drew my attention, was the constant prowling about of boys and girls, from six or eight to fifteen or sixteen years of age, in small groups of from six to ten persons, who are to be met with, in all parts of the city, morning, noon, and night, without any ostensible occupation, not even begging, but literally dragging on a most miserable existence; living in the streets by day, and, when completely wearied, at night resting upon the common stairs, or in areas. I conversed with some of these destitute younglings, and found that most of them were fatherless, some without both parents; that very few, if any, had been employed in factories, so that want of trade could not account for their being in that situation; in fact, they appear, from all I could learn, either from themselves or from the police, to be a constantly accumulating portion of the population of Glasgow, who live by begging when they can, and stealing when they do not beg; and who have no other prospect at present before them but a life of crime, or an early death through destitution. From my frequent meetings with these youthful sons and daughters of want, I was led to inquire of Captain Miller, the intelligent and active Superintendant of Police at Glasgow, whether what had so forcibly struck me was of recent or casual occurrence; and he informed me it was only an evidence of a part of the fearfully increasing destitution in Glasgow, of which I might obtain additional proof by visiting the police buildings, and by personal examination of the houses and habits of the residents in some of the crowded parts of the city. To give myself still more proof of the startling fact which had already unsettled my enthusiastic notions of the unequalled moral condition of the Scottish people, I attended at seven o'clock one morning at the police buildings, and there counted *one hundred and three* unfortunates, who had been picked up the previous night by the police from the streets and common stairs, having no other home or abiding place. More than three-fourths of these were girls, from twelve to twenty years of age; the remainder, with a few exceptions of older women, being lads about the same age. On the same day I visited the Night Asylum, where a refuge is provided for the houseless poor, and in which from sixty to seventy inmates find, some a temporary, others a more permanent shelter. From the police buildings I went (accompanied by a policeman in plain clothes) to some of the crowded neighbourhoods, where the poorer part of the population of Glasgow herd together, and endure their most miserable existence—a living reproach upon their fellow-citizens. Your readers would little thank me, were I to unfold at length the sickening details of the fearful compound of vice and filth, disease and wretchedness, which I met with at every step in the Vennels, Havannah Street, New and Old Wynd, &c. &c. I shall therefore content myself with mentioning but a few of the facts gathered by me in those stagnant sinks of misery and miasma, which must serve as types of *hundreds* of similar instances which the observer of the dreadful condition of the inhabitants of these localities could furnish himself with.

We first visited a small court, leading from the New Vennel, and there, in several rooms, not exceeding *ten feet by eight*, I counted as many as seven persons of both sexes, in many instances without either protection, or covering from the cold ground, except the miserable rags upon their backs. In some places the inmates were lying upon stones, and a piece of sacking, or other covering, appeared a luxury. The herding together of both sexes must act with a fearfully demoralising effect, and was evidenced in a number of cases, where we found boys and girls associated as man and wife. In one room, but little larger than a mere closet, we found a young woman, apparently about seventeen or eighteen years of age; and in the corner, upon the floor, was huddled beneath a sack another figure, which, on lifting the sack, we found to be a boy, who, upon being questioned, gave his name, and declared his age to be only fourteen years; this, the policeman told me, was a well-known young thief. The effluvium from these places was most oppressive, and it was not a little increased by the means which seem to be employed throughout all these miserable districts for carrying away their slops, &c., from their rooms—namely, an open trough at each window, down which is poured all sorts of filth. As little pains are taken either to pour the *whole* of such refuse into the trough, or to cleanse the trough after it has been used, there gradually accumulates, at each window, a heap of the most disgusting nuisances; and while this exists within doors, the want of drainage without, and the constant recurrence of open receptacles into which all the troughs empty themselves, with the utter impossibility for a current of fresh air to pass through these crowded lairs, make the atmosphere almost, without a figure, *thick with pestilence*.

In going from the Vennel into Havannah Street, we went by the side of 'the Burn,' a stream which, even at this wet season, was green with putridity; the houses (or dens) by its side seem to be, if possible, worse than the neighbourhood I had just left. I *crawled* into some of them, for the entrances were little more than three or four feet in height, and found that dampness here increased all the evils which the poor residents in these places shared in common with their neighbours. The ground floor is slightly higher than the bed of the 'Burn,' and when that stream rises a little in height, the water must find its way through the earthen floors of these rooms; but when, as is sometimes the case, the 'Burn' overflows its banks, the whole of these miserable tenements must be almost instantly flooded, and the inhabitants run great danger of being drowned. In the dark places in Havannah Street, I found cases of equal destitution and want, rendered the more striking from their being in the immediate vicinity of the college—the residents in which cannot open a window without inhaling the dreadful atmosphere arising from these last harbourages of misery. In one room in this neighbourhood, we found a poor girl lying upon the floor, who told us she *had been there for thirteen months* with a sore leg, which almost prevented her from moving; and she had thus been subsisting upon the charity of the other occupants of the same dwelling, who, though scarcely less miserable than herself, could not see a fellow-creature die before their eyes, without sharing their poor pittance with her. We asked this wretched creature whether she had been visited in that time by any minister? She answered, No. By any elder? No. By the town's surgeon? Alas! he had come to visit another inmate of that dwelling, but having no orders to visit her, left her to suffer from her festering sores.

We then went to the wynds and closes upon the south side of Trongate and Argyle Street, and there found cases quite parallel in want, misery, dirt, and disease, to those we had just left, with occasional instances of similar charity towards such as were a little worse (if possible) than the rest. There we met, upon one common stair, with two girls, and, at the top of the stair, with a man, who, we were told, had crawled there early in the morning, as he said, to die; and, truly, he did not seem to be far from death. One of the girls told me that she had slept upon that stair every night, for three weeks past, having no other home.

In the Old Wynd, among many places of a similar character, and to which the description of the places in the Vennel will equally apply, we went into one room, about twelve or thirteen feet by seven, in which we counted fifteen living human beings, without bedding of any kind, crowded together, to keep each other warm. I was much struck by the strange exclamation of one of the women, 'God had need to be very mindful of us!'—for, truly, I thought, their fellow-creatures, and fellow-citizens, seemed to mind them but little.

I could extend these most painful details to a great length, but I trust I have already shown enough to arrest the attention of the well-thinking people of

Glasgow; and having thus faithfully pointed out some of the dark evidences of the evil, I will endeavour, on another occasion, to suggest a remedy."

LEAMINGTON SPA.

LETTER FROM A VISITER.

A QUARTER of a century ago, Leamington was an obscure unnoticed village; now, it contains 14,000 inhabitants, many very handsome public buildings, broad elegant streets, splendid hotels, and baths, boarding-houses, libraries, news-rooms, conveyances of all kinds, and conveniences of every possible description. The scenery around is beautiful. Rich meadows and corn-fields, with noble trees dotting the hedge-rows, and here and there clumps, larger or less, of the famous oaks and beeches of Warwickshire, make up what is called in common phrase "a charming country." The muddy, sleepy, little river Leam crawls through the valley, adding little to its beauty, except when at a distance the sunlight falls through the rich masses of foliage upon its bosom, when it serves as well as a finer river to reflect the beams, and produce a species of beauty which only river and wood scenery can exhibit. You must recollect, in order to understand the character of Leamington, that it lies in a country very famous in the most romantic times of our history—that Warwick, with its castle, called by Sir Walter Scott "that fairest monument of ancient and chivalrous splendour which yet remains uninjured by time"—and Kenilworth, with all its romance—and Stratford-on-Avon, with its still deeper and more abiding interest—surround the place, and impart something of their character to it. In the heart of "merrie England," associated as this part of the country is, in the minds of us North Britons, with all the superstitions and fine mellow old jovial customs of our ancient writers—with the May-pole and the Christmas carol—the stout October ale, and Puck and Robin Goodfellow, and the "mistletoe bough," and many a "Midsummer Night's Dream" of fairies and witches—and ten thousand other frolics and fanciful recollections—one feels here really in England—the England of Shakspeare and Milton—the England that grew the oaks that built the ships that conquered the world—"merrie England," "old England"—our fatherland! The idea of being in this time-hallowed country, in the very heart of this heart of the world, gives me very great pleasure, made up of indefinable sentiments and from indefinable causes—all of which, however, have reference to a love of country and a pleasant mellow influence from our old poetry. But I forget this is a watering-place, and, after all, not a proper theme to awaken imaginative or enthusiastic emotions. To keep to our statistics, then, and guide-book descriptions.

The houses in Leamington are well built, and look clean and handsome—made of brick, the dark brick of Warwickshire, coated over with cement, so as to resemble stone. Although the general effect produced is that of cleanliness and elegance, still the damp marks on the stucco, and the cracks and flaws made by time, unless the coating is kept very perfect, spoil the appearance to me; and I should almost rather see the honest plain brick than all this starched and painted gentility. Some very elegant houses there are in the Elizabethan style, both small and large, the sweetest places I ever saw; and I am resolved, as soon as I can afford to build a house, to have a handsome cottage like some of those here, placed in a garden, with comfortable gable-ends, and quaint windows and doorway, and chimneys running from the ground in the shape of ancient pilasters, &c. They are very commodious and comfortable in the inside, I am told, and are really very charming without. There are plenty of churches here, some of them very handsome. The Baptists and Independents have also very neat places of worship.

The baths and pump-rooms are very well—nothing very extraordinary, but well managed; half a pint of water at 8 o'clock, walk in the garden—half a pint again at a quarter past 8, another walk—such is the routine. The waters are principally saline, gently aperient; but there are some sulphureous like Middleton, and one or two chalybeate. The saline waters, however, are the staple; and for the rich, high-fed, and plethoric frequenters of the place, must, together with moderate diet, in general produce beneficial effects. The walks round the neighbourhood and in the town are very pleasant, the streets being broad and regular, the flagging ample and dry, the shops attractive, but the wares somewhat high. Every thing, of course, is done here to attract visiters, and to minister to their comfort. No sweep is allowed to walk on the pavement; if a man's chimney takes fire, he is fined by the commissioners; and any nuisance is promptly and severely punished. Fireworks and exhibitions of divers kinds in the gardens amuse the company in fine weather, and concerts and theatrical exhibitions of various kinds (though there is no regular theatre here) are ready to help the visiter off with his time.

You don't meet so many invalids here as I should have expected. Pale-faced ladies and wretched-looking men in Bath chairs you do here and there encounter, but, on the whole, I think the great mass of disease that seeks Leamington is a very tolerable, out-of-door, bathing, water-drinking, sight-seeing, sort of ailment—young fellows knocked up with too much town dissipation—older gentlemen with jolly round red noses—and middle-aged ones with bloated faces and elephantine legs; or, young ladies wan and chalky—older ones with a withering bloom and jaunty step; or decidedly aged, comfortable dames, with marks of good living on their faces, who spend half their lives in Leamington, and the other half in Bath, for the sake of luxury and "the waters." I don't like to see tall, lounging, young fellows, from twenty to thirty, "flag-hopping" down the Parade, with quizzing-glasses and canes, staring at the ladies, and emitting now and then an inane laugh; in fact, I know no sight more thoroughly contemptible than a group of these poor, worthless, useless, young men, brought up to be of no earthly value to society, and insulting the community, which their very presence disgraces. But I do like to see the very handsomely dressed and elegant women, neat and lady-like from top to toe, languidly sliding, or coquettishly tripping, up and down the Parade, in a sunny morning at three o'clock in the afternoon, as Paddy says. These lady-birds are here at home; and the absence of every thing like usefulness about their lives and appearance, which is intolerable in the great, lazy, hulking men, is quite as it should be in the women. Certainly, the way of walking now in fashion among young ladies is of somewhat questionable propriety; the chest being far too much projected, and the walk itself something a little worse than affected. For my part, I am beginning, I find, to admire the middle-aged (I mean the young middle-aged) ladies most now—a quiet, composed, collected, somewhat dignified manner, with a correctness in dress gathered from experience, and a comeliness that the enjoyment of domestic affection breathes over them; this is my style of beauty.

You may say of Leamington that it is essentially a genteel town; in the hunting season, which lasts all winter, it is crowded not only with invalids, old dowagers, and quiet luxurious people, but by many noble and wealthy families, who prefer it as a place of residence, and by sporting gentlemen, who find it a capital place for combining the luxury of a town life with field amusements. The Warwickshire Hunt has long been famous. I have only seen one bad coach, or vehicle of that nature, since I came, and that was the coach which brought me from the Hampton station to Leamington. The seats were all wet, and the inside generally was comfortless and shabby; three of the traces broke before we got started, so miserable was the harness; and the fare for coming eleven miles, in about two hours and a half, by this precious conveyance, was five shillings! How Leamington or the railway proprietors submit to such a state of things, is surprising. This was the only instance of the kind, however. The "flys," cars, barouches, phaetons, &c., which are to be seen in all the principal streets, are extremely neat; the post-boys generally ride on the single horse, their legs over the shafts, instead of sitting on the box, so that an unobstructed view may be had of the country—no contact with the coachman is necessary, and there is room, if need be, for a whole family.

The post-boys, quite different from our fellows, are neat and well bred—jockey caps and leather smalls, with top boots, and clear harness and carriages, being the order of the day: fare, two shillings an hour. The Bath chairs are neat and convenient, some of them very elegant, and run over the well-flagged streets as smoothly and smartly as possible: fare, one shilling an hour. It is well known that if a horse has a particle of "trot" in him, a butcher's boy will have it out. The only sight approaching to excitement in this quiet and orderly town, is a member of this fraternity, with his hat off and hair streaming behind, his blue frock fluttering, and his legs working in convulsions against the ribs of the broken-knee'd, vicious-looking hack, that, with ears laid back, and eyes glaring, and mane fluttering, and tail in a quiver and quake, scours down the Parade at sixteen miles an hour, the rider leaning far over to one side of his Rosinante, in order to balance a huge, black-faced, dead sheep, or deer, whose legs stick out from the basket on the other. It would make an excellent picture. I have no doubt in my own mind that these fellows are often fined for furious riding; but to keep a butcher's boy out of a hard trot would baffle all the commissioners in Leamington, and Dr J. to boot.

Having mentioned Dr J., I must give you a word or two on the subject, for no account of Leamington would be at all complete in which he did not cut a conspicuous figure. Dr J. is the idol of the place—number 1, letter A. I have just come from the baths; the whole of the gentlemen's side was occupied by military men—generals, colonels, and majors—all patients of Dr J. A public dinner is given to him every year as a mark of respect. When he left Leamington last year for a month, it is said the town was deserted; and I am told a petition was sent to him, on his return, begging him never to do so any more. He drives about in a one-horse barouche or phaeton, very light and work-like, and in every street he stops three or four times, pops into a house, and shortly after pops out again, popping a guinea into his pocket. He is seen every where. Between 12 and 2 o'clock, when he sees patients at home, his door is besieged by carriages, and many persons of distinction go away daily, not being able to see the great man. As you ramble about Leamington, you meet the doctor every now and then; and in the dusk, as you come home, there you have the indefatigable mediciner wheeling away from an hotel or a nobleman's mansion, home, I presume, to his dinner. "Deuced bad, only thirty," meaning fees, the doctor was heard to say one day. "Thirty guineas a-day!" The common story is, that this gentleman realises an annual income of fourteen thousand a-year out of the consequences of the united hard labour and pampering of old England.

MR JAMESON ON NEW ZEALAND AND AUSTRALIA.

MR R. G. JAMESON proceeded to South Australia in June 1838, as surgeon-superintendant of "the Surrey" emigrant ship; and having been induced to spend some time in that colony and New South Wales, and to visit New Zealand, he has since his return given the result of his observations to the world in a handsome volume.* As the production of a well-educated man, possessing considerable powers of observation, and of a sober and moderate turn of mind, we consider it a book of some value to intending emigrants, besides having the advantage of being one of the latest reports on the subject. As we have already treated these colonies in a general manner on more than one occasion, we do not feel called upon to follow Mr Jameson in his observations upon them, a course which might result rather in dullness than in instruction. It will be better, we conceive, to present one or two passages of his book to which we find a particular interest attached.

After giving a detail of the inconveniences which befell the first Adelaide settlers on account of the want of "a survey," he proceeds to remark, that it is a mistake "to suppose that the possession of a considerable capital is indispensable to the success of a colonist. [Other qualities and circumstances being equal, we would suppose that a good capital was an advantage—but we shall let him go on.] On the contrary, it has been found, throughout the Australian colonies, that those who have eventually acquired the greatest estates, the greatest flocks and herds, or who have risen to the highest eminence as merchants, owed their success to the moral qualities of integrity and perseverance, or to a clear-sighted view of the circumstances of their situation, rather than to the original possession of capital."

He then gives the following case as an illustration:—"During my residence in South Australia, I became acquainted with a colonist, who had for many years been a shopkeeper in a small sea-port town in Scotland, where, as he assured me, the utmost parsimony was requisite to enable him to make the two ends of the year meet. Having a large and young family to establish and educate in the world, he was a type of that numerous class of men to whom the British islands, swarming with competitors in every pursuit, trade, and profession, afford no longer a tenable position. Emigration forced itself upon him, not as a matter of choice but of necessity; and having weighed well, on one hand, the lasting interests of his family, and, on the other, the inconvenience of moving, the breaking up of old acquaintances and settled habits, he finally resolved to emigrate. Preferring Australia to the American colonies, on account of its genial and delightful climate, as the field of his future efforts, and having by study become a convert to the South Australian principles of colonisation, Mr Cock obtained a passage for himself and family, and arrived in the colony by no means burdened with capital, or rather utterly unprovided with aught deserving of the name.

He entered into partnership with a countryman of his own, similarly situated; and having calmly surveyed the state of affairs in the colony, he resolved to begin business as a colonist in bullock-driving, at that period, and for some time afterwards, an extremely lucrative occupation. The carriage of goods of every kind, besides furniture and wooden houses, from the landing-places at Glenelg and the port to Adelaide, afforded a most abundant source of profit to those who were masters of one or more teams of bullocks; the average daily produce of one team being from three to four pounds.

In a few months Mr Cock and his partner had acquired a capital of two or three hundred pounds, part of which they invested in town allotments, and an eighty-acre section judiciously chosen at the foot

* New Zealand, South Australia, and New South Wales; a Record of Recent Travels in these Colonies, with especial reference to Emigration and the advantageous Employment of Labour and Capital. By R. G. Jameson, Esq. London: Smith, Elder, and Co. 1842.

of Mount Lofty, where the soil, consisting in general of a rich detritus, must be extremely productive in the average seasons. Their town sections rose rapidly in value; and a few small houses erected by Mr Cock upon his allotments, readily found tenants at a rent which constituted a yearly income of two hundred pounds.

He now found leisure, amidst his increasing occupations, to establish an auctioneer's business, which he carried on for some time with success, but finally abandoned, conceiving that more pleasing, if not more profitable, avocations might be found than that of being instrumental in the selling of property belonging to the necessitous and less successful of the community at a ruinous depreciation. He therefore limited his mercantile operations to the safe and profitable one of selling goods on commission.

Having purchased a few head of cattle, he established a dairy on his farm at the foot of Mount Lofty, the management of which devolved upon his partner, a practical farmer, whose wife possessed all the experience and activity necessary in their situation. When fresh butter was readily purchased in Adelaide at 3s. 6d. per pound, and eggs at 4s. per dozen (a Scotch farm-yard would be incomplete without poultry), it is evident that this undertaking would also be successful.

Encouraged by the high price of sawn and split timber, for building and fencing, Mr Cock carried his operations into the Stringy Bark Forest, where he employed a number of sawyers, splitters, and shingle cutters, who were paid at a rate which enabled them, individually, to earn from 20s. to 30s. per diem, if expert in their trade, and of sufficient strength to encounter its fatigues. It was of little consequence to the employer how much he paid his labourers, since the produce of their labour was an article absolutely indispensable to almost every man in the colony, and he could readily sell it at a profit, or use it himself, with great advantage, in building and fencing by contract.

The necessity of disbursing large sums weekly in the payment of wages, was an inconvenience; but Mr Cock's judicious operations were precisely of that description which it is the interest of a banking establishment to encourage and assist by every means not incompatible with the rules of systematic business. Between the operations of a bank, and the pursuits of spirited and judicious individuals, there exists a relation of mutual dependence and support. It is from the exertions and enterprise of such individuals that a community has its vital circulation. Their example encourages the timid and shames the indolent. Their operations cause a rapid accumulation of produce, a quickened circulation of money, an increased consumption of merchandise; and it is from them that business derives that tone of health and vigour in which a banking and discounting establishment reaps its amplest harvests.

It is here to be observed, that, like almost every man throughout the Australian colonies who has risen from an humble condition to one of affluence, Mr Cock is constitutionally and habitually temperate—in short, a tee-totaller. To abstinence from ardent spirits and all unnecessary stimulants, he unquestionably, in a great measure, owed his clear judgment, as well as a physical constitution capable of undergoing much hardship and fatigue.

It will readily be supposed, that in neatness and systematic management, his farm was surpassed by none in the colony. At this period, agriculture was to be considered as an experimental pursuit, and he, like other judicious colonists, conducted this part of his operations on a very limited scale. On his farm there was a space of two or three acres under a crop of maize, and a field was broken up for the reception of wheat. The maize was by no means equal to what I have subsequently seen in New Zealand; but it looked green and healthy, although the weather had recently been very dry. The soil and situation seemed to be well adapted for the culture of the vine, the orange, and the olive; and he informed me of his intention forthwith to cultivate the first-named plant, availing himself of the services of some of the German emigrants, who had just arrived in the colony. Whether or not he has carried his intentions into effect, and with what success, I have not been able to ascertain. He relied upon his dairy chiefly for the reimbursement of his farming outlay. In the neighbourhood there was abundance of fine kangaroo grass, which, at a small expense, he converted into hay and carted into Adelaide, where it was readily purchased at L.12 per ton.

To conclude this lengthy but not perhaps uninstructive sketch, Mr Cock, who had struggled vainly for many years amidst the difficulties of a cheerless and precarious situation in Scotland, although endowed, in an eminent degree, with the clear and discerning faculties and the prudence which in all countries are most conducive to success in life, was thus, in less than two years from the date of his arrival in the colony, in the enjoyment of wealth, without having trenched upon any hazardous, speculative, or discreditable pursuit. The presence of his father, and the whole of his kindred, who have subsequently joined him, will tend greatly to enhance the enjoyment of his well-earned independence."

The Bay of Islands is an extensive district in the northern part of the north island of New Zealand. It has long been partially and irregularly colonised and latterly has become highly distinguished in consequence of Governor Hobson making it his residence. We have from Mr Jameson some curious notices of the arrangements by which the civilised people in this district maintained social order before regular law was introduced. "At the period," he says, "of my arrival, it contained little more than fifty European dwellings—cottages of wood, white painted, with verandahs; a church of the same materials, but of larger dimensions; and a native *pa-a*, or village, consisting of about a hundred and fifty huts, enclosed by a high and strong fence. The presence of ten or twelve large ships, besides a fleet of small coasting craft, and open boats and canoes, plainly indicated that the place was already of some commercial importance, although as yet it recognised neither flag, law, nor government, and had neither a court of justice, a jail, nor a custom-house.

Kororadika, in the beginning of 1840, contained about three hundred European inhabitants, of all ages and sexes, exclusive of the numerous sailors whose nightly revels constituted the only interruption to the peace and harmony which usually prevailed. These gentry resorted, also, in great numbers to Pomare's village, in the inner anchorage, near the new township of Russell, where Pomare himself, the greatest chief of New Zealand, carried on the lucrative trade of grog-selling, besides another of a still more discreditable kind, for the convenience of his reckless customers—French, English, and American. Here might be seen the curious spectacle of a still savage chief enriching himself at the expense of individuals who, although belonging to the most civilised and powerful nations of the world, were reduced to a lower degree of barbarism by the influence of their unbridled licentiousness.

Hitherto no *legal* restraint upon crime or violence had existed in New Zealand. The authority of Mr Busby, the British resident, was merely nominal. That gentleman lived on the opposite shore of the Bay, at the distance of five miles, and his visits to Kororadika were few and far between; but had he lived in the heart of the settlement, he could have exerted no authority either to punish offenders or to settle disputes. The natives respected him as the representative of the British government; and among the Europeans he was rendered popular by his courteous and conciliatory deportment. His appointment, however, led in nowise to the maintenance of order, or the prevention of crime; and his interference in the affairs of individuals, without the power of enforcing his decisions, could have produced no satisfactory result.

Yet crimes, misdemeanours, and larcenies, were of remarkably rare occurrence; and in no part of the world were the persons or the property of individuals more secure than in this little settlement, within whose precincts no lawyer had ever yet shown his face. The stores were full of merchandise, to the value of between twenty and thirty thousand pounds. The merchants and grog-sellers were known to have in their possession large quantities of specie; nevertheless, the crimes of robbery and housebreaking were unknown and unfeared. Moreover, many commercial bills were in circulation, which were in every case duly honoured. In a word, no statements could be more widely at variance with truth than those which represented the Bay of Islands to be a nest of outlaws and criminals.

However ungenerous it may appear to throw a shadow of suspicion on this pleasing picture of primitive virtue and good conduct, yet it might, perhaps, be argued that the absence of crime and misdemeanours arose less from any aboriginal purity of heart and mind, than from the circumstance of the people being sensible that they were bound together by one common interest, and that the maintenance of social order was indispensable to the safety of their lives and property. Hence they effected this by the influence of a judicial association, the members of which, dispensing with the tedious and expensive forms of justice, scrupled not to act as constables, and to apprehend summarily the culprits they were to try. If, after as complete an inquiry as the circumstances admitted of, the accused was condemned, they then passed immediate sentence upon him, and forthwith proceeded to put in execution the punishment of banishment, preceded by the more dreadful operation of tarring and feathering. Having been stripped, and covered with an enduring coat of the proper materials, the prisoner was led several times backwards and forwards along the beach, to the tune of the *Rogue's March*, and great was the joy with which the natives beheld this august ceremony. The culprit was then put into a canoe, and ordered to leave the beach of Kororadika, with the positive assurance that his reappearance in the neighbourhood would entitle him to a repetition of the same process. Resistance to the mandates of this tribunal was useless, for its members could, if necessary, call in the ready and willing assistance of the natives. Mercantile operations, therefore, were carried on to a considerable extent and with implicit confidence, and debts paid with scrupulous regularity. It was correctly assumed, that since every able-bodied member of the community could obtain a good subsistence with very little labour, no indulgence or mercy could be properly extended to those who gave way to criminal propensities. Were we to judge by facts, we might suppose that the summary processes of this species of Lynch law were more efficacious than regular tribunals; for in a few months after Captain Hobson had established his police court and petty sessions in the Bay of Islands, it was found that offences were committed, not only more frequently but of a graver nature than during the good old times."

STRANGE TRAITS OF RECENT TIMES.

The remarkable characteristic of our country is unquestionably the boundless individual freedom, joined to the complete protection given to every personal right. Perhaps it is only the strength and prevalence of this noble feature of our land, which makes any occasional exception from it the more striking. However this may be, there cannot be any harm, but, on the contrary, much good, from pointing out a few traits of comparatively recent times, in which we see the leading principle, as it were, not fully firmed or consolidated. The keeping of such traits in mind, may have the effect of more thoroughly assuring the consolidation of the principle of the sacredness of individual rights.

In the year 1807, three hundred French prisoners were kept in a small country house at Greenlaw, in Mid-Lothian, under the care of a company of soldiers. As these men occasionally made attempts to escape, very strict regulations were enforced for their secure keeping: in particular, there was a strict order that every light should be extinguished, and that the prisoners should be perfectly quiet, after nine o'clock at night. This was all very well; but, while such an order, and several of the like nature, were issued formally for the regulation of the prison, a verbal order was also handed down from one set of guards to another, to the effect that, if lights were seen and noises heard in the prisoners' apartments after nine, and if the sentinel, on calling out to them to obey the rules, found himself disobeyed, then he was to *discharge his piece through the window*. This order was in force for a considerable time, until at length a Captain Rowan, of the Stirlingshire militia, thought proper to mitigate it so far as to require that, before such a step was taken, the officer on guard should be called to judge as to its necessity. Soon after this regulation was made, about ten in the evening of the 7th of January of the year above mentioned, a noise was heard and lights observed by the sentinel in one of the rooms on the ground floor. The sentinel reported the circumstance to the sergeant, and the sergeant to the officer in the guard-house, a young ensign, who immediately repaired to the spot, and called twice in at the window to order the enforcement of the rules. No notice being taken of the order, the officer commanded the sentinel to fire in at the window. The man obeyed—missed fire—and was commanded again. He now fired, and the shot penetrated the body of a prisoner, by name Charles Cottier, who appears to have been at the time quiet in his bed, and who died of the wound next day.

The officer, who bore an excellent character, was subjected to a full and careful trial, when Mr (now Lord) Jeffrey exerted his eloquence in his defence; but he was found guilty of culpable homicide, and sentenced to nine months' imprisonment—the court being of opinion that, though he had an express order for what he did, the circumstances demanded the exercise of the discretionary power with which he was invested. The case is only alluded to here, on account of the recklessness shown by such an order as to the life of men in the situation of prisoners of war, within the last thirty-five years.

A singular attack upon individual liberty occurred in the West Highlands in 1805. A poor Baptist preacher, settled in a meeting-house there, and who had once been a herring-curer, was preaching one Sunday on the beach to a small congregation, when a neighbouring gentleman, attended by a proper force, seized him and sent him to Greenock to the care of the officer superintending the press-force of that place. Not only was he not allowed to take leave of his family, but an interdict to recover his person and a writ of *habeas corpus* were successively defeated by the speed with which he was hurried from Greenock to Ireland, and from Ireland to a vessel in the Downs. The justice had heard some exaggerated story of his calling in question the lawfulness of war in his sermons, and, thinking this "seditious and immoral," had bethought him of bringing the press into force as a means of ridding the country of him, but without taking care to ascertain his own title to interfere. In reality, the whole extent of the powers of a justice with regard to the press was to give information of any suitable man in his neighbourhood, and protect the press party in its proceedings. The preacher, after enduring every hardship and indignity proper to his situation for six weeks, was liberated upon a petition to the Lords of the Admiralty, who at the same time gave him a protection for the future. He raised an action before the Court of Session, against the gentleman who had so strangely interfered with his liberty, and gained the cause with a hundred guineas damages, the lords, with one exception, taking strong views against the defendant, whom they could not admit to have acted in good faith in the case, in as far as he took an oblique way of getting quit of a man whom he supposed to be dangerous, though they readily owned that his intentions appeared to have been good.

So recently as 1790, the Lord Justice-Clerk, or supreme criminal judge of Scotland, asserted and acted upon a right, which he considered as inherent

in his office, to open any letters as they passed through the Edinburgh Post-office. On the 14th of April in that year, a gentleman who had been fatally victor in a duel, fled from justice, and was outlawed. A writer to the signet in Edinburgh, who had been his legal agent, receiving his rents from his land-steward, conducting a law-suit about a salmon-fishing, and so forth, was surprised, five days after, to receive his letters, five in number, through the medium of the Justice-Clerk, with the appearance of having been opened and resealed, and bearing on the exterior, in each instance, the words, "Opened and resealed by me, Robert Macqueen." The fact may appear difficult of belief; but, remote as the period now is, the agent still lives, and the present writer has actually *seen* several of the letters, bearing the above inscription. The gentleman immediately waited upon the judge, and remonstrated bitterly against an act so injurious to his feelings and to his interests; but was informed that there was sufficient authority for what had been done, and that Sir Thomas Miller, the preceding judge, and others at an earlier period, had constantly followed the same practice. It was persisted in next day with regard to an equal number of letters. The victim of this procedure was on this occasion alarmed respecting his wife, then about to be confined for the first time, fearing that her receiving any letters from her relations which had been so treated, might give her a dangerous shock; and on representing this to the Justice-Clerk, he obtained a promise from his lordship that no letters addressed to the lady would be so treated—the gentleman, however, giving his *word of honour* in return, that, should any such letters contain references to the duellist, they should immediately be handed to the judge! The agent took a protest against the proceedings of the Postmaster, and sent a memorial for the opinion of English counsel. Mr Scott, then Solicitor-General (afterwards Lord Eldon), gave a characteristically cautious opinion, but upon the whole concluded that the act of the Justice-Clerk was without legal grounds. Mr Thomas Erskine pronounced at once that the judge was liable in terms of the Post-office act of Queen Anne, in a penalty of L.20 for every one of the letters opened. However, the complaints of the agent never went farther. Thereafter, when playing at whist with the Justice-Clerk in private society, he was accustomed to remind him of this debt, and when he was the loser, would tell his lordship that he would write off the matter in his *post-office account*.

We shall not of course be supposed to draw these traits of past times into notice from any feeling unfavourable to the parties whose conduct was amiss. We thoroughly believe that all of these parties acted with what they conceived to be good intentions; or, if not in any one instance, it may be hoped that time has brought better views and better feelings. We only wish to illustrate that spirit of particular eras, under which individuals are always more or less liable to act. The two first anecdotes tend to show the moral effects of a state of war: let us add to them the not less remarkable fact, that, so lately as the end of the reign of George II., a man taken up on the streets of Edinburgh for swearing (a vice indulged in by every gentleman of that age) was next day shipped by the magistrates on board a tender in Leith Roads! It cannot be sufficiently impressed on the minds of the humbler class of people, how severely war always presses upon them. They are generally the most easily induced to look favourably on a proposal to have a war, and yet are those whose comfort is most invaded by the horrible scourge.

LIFE IN UPPER MISSOURI.

In the last volume of the Journal (Nos. 474 and 476), we gave extracts from some letters written by a young person engaged in the trade of peltry-collecting in the Upper Missouri territory in North America. They presented a lively and striking picture of a life spent in the most complete abstraction from society, and varied only by adventures with savages and wild animals. Another letter, written by the same individual in May 1841, gives some even more forcible sketches of existence in Upper Missouri. He describes himself as having been promoted to the charge of his fort, which is the remotest of a chain on the Missouri River, and as performing this duty in a dress resembling that of Robinson Crusoe, yet always maintaining robust health and high animal spirits.

The occurrence of a prairie storm in the summer of 1840, gives occasion for the following modestly related anecdote of a presence of mind sharpened by a continual exposure to danger amongst unfriendly Indians:—"I used always," he says, "to sleep in one of the bastions, it being cooler and more free from vermin than the rooms, and safer in case of accidents. I went up about eight o'clock, and sat down smoking my pipe by one of the ports. The evening had been oppressively hot, and about this time the sky in some places was black as pitch. In a short time it was black round and round; the clouds descended till they appeared almost to touch the ground; the atmosphere was close and suffocating. I remarked to an American, that, if I mistook not, we were going to have a fearful night. The words were scarcely out of my mouth, when I heard like a low moaning sound among the ravines. Presently the gale commenced, accompanied by the loudest thunder, the most vivid lightning, and the heaviest rain, I ever saw. It shook the bastion to its foundation. We ran down; I lost my hat in crossing the fort; and by the lightning I could see our flag-staff bend like a willow. I went into my room and lighted a candle, the hurricane still continuing; I heard something fall, and thought it was the old bastion. I tried to get out to see; and after being fairly driven back four times by the wind and rain, I got out and found about two hundred feet of my pickets flat on the ground. This, you may guess, was a bad mess. I called all hands, however, and told them we must remain in the breach till morning; and if any Indians appeared, we could make a breastwork with the fallen pickets. About midnight, however, it cleared off. I got spades and picks, and set to digging a trench two feet deep; and so hard did we work, that we had them all on end again about daylight, and made them the same height as the others with old planks. We had scarcely finished, when a large war party of Blackfeet arrived on their way to the Crows. There is no saying what might have been the consequences, had they come and found us so exposed as we were by the falling of the outer defences; for they are a bad set."

"I may now," he continues, "give you a sketch of boat-voyaging on the Missouri. You say in your last letter you would like to try it as a novelty, but you would find it confoundedly rough work, and eke annoying. How would you like sometimes to be stopped three and four days in the same campment, lying by a fire in the woods, or snoozing it off in a lodge, Indian fashion; and sometimes forced to put ashore, when wood is scarce and little shelter to be had, in a high north wind, and the snow like to take the skin off your face? All that and much more has he to undergo, who tries *voyaging* on the Upper Missouri. But that is nothing to a *voyageur*. By and by the weather gets better, the fires begin to blaze, the kettles to boil; and after stowing away a few pounds of meat, and smoking a pipe, contentment and good humour resume their reign, and all former sufferings and privations are forgotten. In my last letter I gave you a long account of my trip down from my post to Fort Union in a canoe, accompanied by one man only, and he old and frail. It was rather a dangerous voyage; but, thank God, it ended well, as you must now know. On this occasion, however, the case was different; for I had, instead of one companion, at least thirty-five or forty, and off we went 'right merrilie.' We started on the 3d of April 1841, from Fort Mackenzie for Fort Union, with the returns, consisting of 1108 packs of robes, and a good many packs of other peltries; in all, about 1136 packs, in one 'keel' and three mackinaw boats—this being my first trip on water in this country in a large boat—the whole under charge of Mr C., one of the partners: I was second in command. We made a very good stretch the first day, and camped at night very much fatigued. The morning of the 4th was bitter cold, and nearly a foot of snow had fallen during the night. It continued to blow a gale, accompanied with heavy snow; so that we had a lodge put up, which we brought with us in case of our being unable to travel, and remained quite snug the whole day. On the morning of the 5th we started, although it was bitterly cold, and proceeded very well till about eleven o'clock, when the keel got fast aground in a rapid. Freezing as it was, all the men had to get into the water, where they wrought about five hours, but could not get her off. I went below to where the small boats had put ashore, and had one of them unloaded, and sent her to take out part of the load of the keel, after which we got her off. Four or five of the men were seized with violent cramp, owing to being too long in the water. The day was as cold as any I ever felt in Scotland. Early on the morning of the 6th, we commenced reloading the mackinaw, and started; weather still cold. We had not proceeded far when one of the mackinaws got aground. We had to put ashore with the other boats, and send all hands to get her off. It was so late before we could succeed in this, that we could not start again; but had to commence unloading a small boat that had got damaged in the morning. During the night it snowed very hard. The water was, however, baled out of the unloaded boat in the morning; and after stopping the leaks, we reloaded her with all expedition, the weather looking very dull. We had not finished covering the load, when the snow again commenced. Mr C. and I had our lodge put up, as, owing to the snow and cold, we could not start that day. Here we remained till the 10th, the weather as cold and severe as any we had the whole winter. Fortunately, I had some books and a pack of cards, with which Mr C. and I whiled away the time. You can have no idea how annoying it is to be laid past in this manner. Every day seemed a week; and as I had to see all the boats attended to, I never had dry feet half an hour in the day. During this time, the snow fell upwards of two feet in depth.

We made a start on the morning of the 10th, in spite of the cold, which was piercing. I saw two large bears after we started. We had not proceeded far when the keel boat got hard and fast aground; the mackinaws, however, passed. After trying in vain to get her off, until the men could stand no longer in the water, I went in the yawl with all hands, and had one of the mackinaws unloaded, and took out part of the cargo of the keel; this lightened her, and we got her off; reloaded her and the mackinaw the same evening, and went a little below where there was timber, and camped for the night. Many of the men had their legs dreadfully swollen with the cold water. We started on the 11th, and put ashore at the head of a rapid to examine if there was enough of water to pass, but found the keel would have to be partly unloaded. We were two days getting all the boats over this cursed place, one of them being so much damaged that she had to be unloaded, and hauled high and dry to be repaired. Here the country has in many places a curious appearance, the river being hemmed in by precipices on each side, which have been washed by the rains into every shape; they have the appearance of the ruins of an old cathedral in some places, in others of fortifications, whilst here and there the appearance of old walls would make a person think that more than nature had a hand in the formation. There is one large rock called the Citadel, which stands jutting into the river not less than 300 feet in height, and another at a little distance which very much resembles Pitt's Monument in Edinburgh; but owing to the inclemency of the weather, I did not much enjoy the rugged scenery, which is here and there enlivened by a band of bighorn, hanging, as it were, on the brow of the precipice, and regarding us securely as we glide past far below them. We started again on the 13th, but had not proceeded above three miles when we were forced to put ashore owing to the high wind; here we remained all day. Some of our men went to hunt, but were rather unsuccessful. Starting again on the morning of the 14th, we passed Arrow River, but had gone only a short distance, when a mackinaw got aground. We put ashore to wait for her, but before we could get her off, the wind began to blow so hard that we could not again start that day. I played cards and read to kill time. 15th—Started early, and passed the Judith River. This is a place where the Crows generally cross to steal horses from the Blackfeet. There is plenty of timber here for the purpose of concealment, and every point is full of Indian forts, in one of which Mr C. and I took up our quarters, having been again forced to put ashore on account of the wind. We remained here during the rest of the day. 16th—Up and off by peep of day, but had to put ashore in consequence of the wind, which detained us till late in the afternoon; when we again started, and passed the rapids of Holmes and Rondin, on the latter of which one of the boats got aground: it was nearly dark when we got her off, so we camped at the foot of the rapid for the night. We are now fairly in what the voyageurs call the *Mauvaise Terre;* the precipices rise abruptly on each side of the river to a tremendous height, and are washed into a great many curious shapes, intersected by deep gloomy ravines which run far back; there are a few stunted pines here and there, which in their appearance harmonise well with the dismal character of the place. Here, also, we saw large bands of bighorn, but they are very poor at this season."

Several other days passed in a similar manner, no one without some unpleasant accident; and when they had been out fifteen, they had only proceeded as far as one could easily have ridden in two. On the morning of the 5th of May, amidst stormy and wintry weather, they started from the neighbourhood of a place called the Round Hill. To continue the journal of the young trader—"We passed immense bands of buffalo to-day, and saw the work of the beaver in our last camp. They had about two hundred trees cut down, as neatly as if chopped by an axe, some of them as thick as my body. We kept on making a little each day till the 11th, on the evening of which day we arrived at Fort Union, having been no less than thirty-nine days on our trip."

The following is his account of his companions:—"The voyageurs are generally either Canadians or French creoles. Some few are of other countries, but none are equal to the first mentioned, either for enduring the hardships and fatigues of a voyage, or the changes of the weather. Uncle Toby speaks of 'our army in Flanders' as something considerable in the way of swearing; but Marlborough's men must have been sober Christians in comparison with our voyageurs. They are always worst when engaged in rough work. They are, as might be expected, woefully ignorant, and scarcely one can read a single word. One would think that, from the nature of their occupations, they would be unhealthy; but that is not the case; for, with the exception of rheumatism from being obliged to go so frequently and in all seasons into cold water, they seldom have any disease. *Indigestion* is certainly not one of their complaints; the quantity they eat is enormous. Some of them, when we were lying by in consequence of the bad weather, would cook and eat from morning till night. One day I particularly observed an old Canadian of the name of Mallet; he first discussed about three pounds of meat roasted on the fire like a steak; he had hardly finished that when the cook of the large boat called the men to breakfast; there he ate as much boiled meat as would have served you for three days at least, drank about a gallon of the *broo*, and then put the marrow-bone of a bull and about another pound of meat to the fire to be cooking, whilst he cut a pipe of tobacco and smoked it. I saw him the same day eat two more marrow-bones and nearly a whole goose, besides taking his share of the mess. But there are few of them a bit better; it is incredible what they can stuff into themselves. Though growling is a part of their nature, they are very respectful to their superiors; they make themselves upon such free and easy terms, as would to you appear pretty much like forwardness. The moment their fatigues and sufferings are over

the fire kindled, and plenty to eat, they are as happy as princes. There is a continual chattering and laughing among them, and frequent songs. Some of their boat-songs are very pretty, and they roar them out manfully to the stroke of their oars."

THE PIRATE.

[From the *Manx Liberal.*]

By the time that the several dispositions ordered by the captain had been made, the stranger, a beautiful brig, had approached within long gunshot. We (that is, officers and passengers) were congregated upon the poop deck, in anticipation of momentarily receiving an iron summons to round to. This, however, did not appear to be part of the unknown's policy; and whilst he was fast drawing ahead, Macsawney, who carried on the duties of the ship as if she floated unquestioned mistress of the blue expanse, ordered eight bells (having taken the sun) to be struck, and invited his passengers to partake their customary meridian. They were in the act of descending, when Bosy reported that the brig, having given a broad yaw to leeward, showed Spanish colours at her peak. These were scarcely set ere they were dipped, an indication that it was their wish to speak us. The atrocities which have degraded Spain's once imperial banner, coupled with the rakish loom of the stranger, and our proximity to the Cape de Verd Islands, the favourite resort of the lawless, caused us to survey him with a curiosity in which apprehension was not slightly mingled. Our doubts and fears were in course of speedy solution, for the self-styled Spaniard had now lessened his distance to a couple of hundred yards. A more exquisite hull it was impossible to look upon—long, low, and of exceeding beam—the bow round as an apple, with a cutwater sharp as a wedge, from which projected a female figure-head of the most graceful proportions. Every line was symmetry itself—her bottom beautifully moulded, her copper bright as burnished gold, and her run clean and fine as the heels of a racer; in short, the very model of what an English nobleman's yacht should be. The capacity might amount to some three hundred tons. The beauty of the hull was fully equalled by the gear aloft, which was taunt, tapering, and well set up; the lower mast was clean-scraped and bright varnished, with long heads painted white. He carried courses, topsails, with a slab reef to make them stand better, top-gallant sails, fore-topmast staysail, jib-boom mainsail, a thundering ringtail, fore-topmast and fore-top-gallant studding sails; his royal yards were sent down, and his flying jib-boom housed. All his yards were remarkably square, his canvass well cut, and it was impossible to surpass the light airy tracery of his taper masts, with all their mazy lines of superincumbent cordage. As we approximated, we gave our meteor flag to the breeze—his Spanish ensign still floating at his peak. His lovely craft was in perfect command, and having drawn a little before our lee beam, he immediately hailed.

"Ship, ahoy!" "Hallo!" responded Macsawney. "What ship's that?" "The Saucy Sally. What brig's that?" "The Vomito Pietro," was the answer. "Where are you from?" "The Cape of Good Hope." "Heave to—heave to! I have intelligence to communicate."

"Ay, ay," sang out Mac. "Cheerily, my lads; round in the weather main and topsail braces. Foretop there! down top-gallant stun'sail; in with big Ben; clap on the topmast stun'sail downballo! That's it—with a will, men. So—o! Man royal and skysail clue-lines!"

In a surprisingly short space the Saucy Sally was reduced to top and top-gallant sails, jib and spanker, the fore and main course hanging in the brails. The Vomito Pietro was still under sail, although, while our ship was obeying her injunctions, she had hauled up so sharp in the wind as not only to deaden her way, but to drop a short distance astern. Perceiving our main-topsail to the mast, he once more ranged within hailing distance.

"Ship, ahoy! Send a boat aboard of me, d'ye hear?" "Brig, ahoy!" shouted Mac. "No boat of mine leaves this ship. If you have any thing to communicate, send your own boat."

"Send your boat this instant, sir, or I'll fire into you." "Blaze away," sang out the imperturbable Scotsman. "Down on the deck, lads; you shall pepper him by and by."

A pause ensued; the vessels gradually separated; the Vomito Pietro hove to some sixty yards forward of the Sally's lee beam, and, without further ceremony, exchanged the Spanish ensign for the skull and marrow-bones. At this moment both vessels had nearly lost steerage way, the wind having fallen dead calm.

"We must be guided by circumstances," said the captain, addressing us; "but in no case must we allow them to obtain a footing upon our decks. Better go to the bottom like men than be flung into it like dogs. He will no doubt seek to board under cover of his long guns. Let him try; but do not, I implore you, throw away a shot until each of you is sure of his man: every one they lose adds to our chance of escape."

The captain was right in his conjecture, for scarcely had he ceased speaking, ere the Vomito, apparently satisfied with reconnoitring, launched both her quarter-boats full of men. No sooner had they touched the water, than they sent forth a wild yell, to which, as a fitting accompaniment, the roar of their long eighteen opened its deadly throat, happily without any material injury resulting. Emboldened by the non-return of fire, the boats, after a brief conference under the Vomito's stern, commenced pulling, making somewhat of a sweep, apparently with the design of assailing the Saucy Sally on either quarter.

"Divide yourselves," continued the watchful and indefatigable Mac; "but, above all, be cool—be steady. Ah!" he exclaimed, rubbing his hands with great delight, "it would be a noble chance. I'll try it, by George! at the worst it can but fail. Look alive, a hand or two; ease off the weather and haul in the lee main braces; there's a cat's-paw aloft; the ship already feels it, and there will be more ere long. Jump aft, O'Donoghue; take the wheel; run the pirate alongside; and, d'ye mind me, let every mother's son of ye, as he wishes to see kith and kin again, pay the strictest attention to my commands."

Circumstances had indeed altered the Scotchman's plans. At the very moment he was endeavouring to give a warm reception to the five-and-twenty or thirty wretches, armed to the teeth, fast approaching in the pirate's cutters—at that very moment a light air swelled the Saucy Sally's sails. Like other tropical flaws, this air was extremely partial, and did not yet extend to the Vomito, which lay a motionless log on the water. Freshening in its course, at length it struck the guilty brig, but too late to save her from the grapple of the Saucy Sally, who was already speeding under its full influence. Two minutes sufficed to lay her alongside, but few more to pour her resistless crew upon the corsair's decks; and, whilst the main body battled the astonished ruffians, one or two secured the helm, and got the brig before the wind—Saucy Sally bearing her faithful company, her passenger riflemen picking off the banditti with surprising accuracy. Discomfited on every hand, the survivors hurried below, leaving their trophy in the Sally's power. The boats, meanwhile, foiled almost in the moment of possession, rowed with all the energy of despair; but the breeze had once more set in strong and steady, and both the Saucy Sally and the Vomito were dropping them fast. Their maniac yells rent the air—the water flashed under the fury of their strokes, and the boats were urged onwards with a strength almost superhuman. At the moment when hope must have been all but dead within them, the Vomito suddenly hove up in the wind's eye. Could it be? Had the merchantman failed, and were their comrades victors? They paused upon their oars, joining company, as if to ponder the course proper to be pursued. Brief was the space permitted for consideration. A plash, a stunning report, and an iron shower, sped its fatal flight, dashing their splintered oars from their nerveless grasp—scattering, with one crash, the dying and the dead, with the shattered skiffs that bore them, in ruined fragments upon the devouring deep! One instant, and the welkin rang with the howl of despairing fiends; another, and nought was heard save the faint and passing struggle of mortal agony—fearful but just retribution! Their own trusted weapons had been turned upon themselves; and O'Donoghue, by the mouth of their boasted Long Tom, had sped them unannealed to their account.

SPRING IS COMING.

BY CAMILLA TOULMIN.

SPRING is coming! joyous spring!
See, the messengers that bring
Tidings, ev'ry heart to cheer,
That her advent bright is here;
See, the many-colour'd train,
Peeping up on glade and plain—
Crocuses, and snow-drops white,
Struggle into sunny light,
And the violet of blue,
And the valley's lily too.
I could dream their fairy bells
Ring a merry chime that tells
Spring is coming!—and when they
Faint, and fade, and fall away,
'Tis, that long by winter nurst,
Their full hearts with joy have burst.

At the tidings that they bring,
"Spring is coming! welcome spring!"
Children we of northern skies,
Most her loveliness do prize—
Most, with longing hearts, we yearn
For her swift and sure return;
We who know the sullen gloom,
When the earth is nature's tomb;
Well may we with heart and voice,
At the sweet spring-tide rejoice!

Dwellers in more genial climes,
Not for you these passing rhymes;
Ye can never understand
The contrasts of our northern land.
Ye are not so great and wise,
Ye have lowlier destinies
Than the children of a zone
Where the wintry blasts are known.
But gaunt famine doth not stride
By the proud and wealthy's side;
There ye see not little feet
Press upon the frozen street,
While the infant's tearful eye
Tells its tale of misery.
When in curtain'd, lighted hall,
What to you that snow-flakes fall?
When beside the blazing log,
What to you is frost or fog?
When on down your limbs ye stretch
Think ye of the homeless wretch?
To *the poor* it is that spring
Doth her richest treasures bring;
And methinks that I do hear
Countless voices, far and near,
Joining in a grateful strain,
"Spring is come at last again!"

March 4, 1842.

LITERATURE IN FRANCE.

We are gradually becoming inoculated by the French and German taste for cheap bibliopolism. Perhaps our fresh issues of books of sterling and recognised merit, are almost as cheap as they could be made, consistently with careful production, with the supply of a serviceable paper, and with the excessive duty to which that article (of downright necessity) is in this country ridiculously subject. But the prices of all new books amongst us are perfectly enormous compared with those which prevail on the Continent. Every one who has been to Germany knows what the fair of Leipsic produces. In France, the business of publication is carried on with perhaps still less expense to the public; immense editions are sold, and author and bookseller are both of them well remunerated. Facts in these cases are the only arguments. During the last eighteen months, a series of little works, entitled "Physiologies," as "Physiologie du Tailleur," "Physiologie de l'Etudiant," "Physiologie de l'Homme à Bonnes Fortunes," has issued from the Parisian press—not very voluminous, certainly, but excellent in quality, and copiously illustrated by Gavarni and all the most eminent caricaturists of France. For these little works, for which a crown at least would be charged in London, with probably some lying nonsense in the trade puffs about "unprecedented cheapness," a single franc is charged in Paris. Let the London trade look to this. If they are not prepared to treat the public with liberality, with what face do they complain of want of encouragement? So long as they publish their books at unpurchasable prices, that they should break by dozens is only a natural consequence. A "Bibliothèque Française" is now being published in Paris, in thirty volumes, presenting, for three or four francs a-volume, the works of the most celebrated writers of France, illustrated by learned notes and a selection of the most esteemed commentaries. The publisher (it is no fulsome falsehood to call him "spirited") deals with nothing but *chefs d'œuvre*, and has literally realised his promise that "leur extrême modicité de prix" would place these volumes in a state of the most satisfactory completeness, "à la portée de toutes les fortunes." There is a splendid work called "Le Jardin des Plantes," with richly coloured engravings of the highest excellence, zoological, floricultural, and botanical—portraits of Cuvier, Buffon, and the other naturalists of France—views and plans of the gardens, &c.—now going through the press in thick and voluminous parts, for 30 centimes (3d.) each! If it must be our fate (which seems extremely probable) to be speedily outstripped in information and intelligence by our neighbours of the Outre Manche, let the shame rest upon monopolising, money-grinding booksellers. Let not penny magazines and cyclopædias, for the diffusion and confusion of "useful knowledge," be flung in our teeth as an answer to these remarks. They are no answer; letterpress and illustrations are both the work of inferior men, incapable of awaking the popular mind, or inspiring popular interest.* But the illustrations of animal and vegetable nature, to which we have alluded above, are the productions of the first artists of France; and elegance and exactitude of outline are rendered complete by the most magnificent colouring after nature—what a contrast to the stark and staring woodcuts by which foreigners are so much diverted in our "penny literature!"

In addition to the vast fecundity of the Parisian press in novels, romances, and tales interminable, bristling in *feuilletons*, and packed into library volumes, there is likewise a translation-factory from the English kept pretty briskly at work. The lingual steam-engine is driven by M. Defauconpret, who has translated the works of Sir Walter Scott for the Cabinets de Lecture. This gentleman has also translated several copies of Cooper's novels, and some of Captain Marryat's—the preference of selection being unquestionably accorded to them in consequence of their "naval" character—a school of art in which France is extremely backward. These translations, as may well be conceived, are truly Frenchified affairs; even the very names being curiously and ridiculously metamorphosed; thus, we have "Monsieur le Midshipman Easy" for one title, "Le Marin à Terre" (The Middy Ashore) for another, and the last issued figures as "Joseph Rushbroock." But no Frenchman ever yet could spell an English name.

The most noticeable thing about these publications is the remarkably cheap price at which they are sold. Each volume is charged only 3½ francs, whilst the paltriest translated trash that goes into our circulating libraries here is impudently priced at half a guinea a-volume. The most splendid works of original fiction, witness Eugene Sue's "Mathilde," are published at the same price as Defauconpret's translations. Observe how, by this liberal arrangement, author and public (and the bookseller himself in the long run) are benefited. Cheap reprints of "standard" English works, from French presses, abound; and Galignani's establishment has been cut out in some directions, and forced in others to reduce its expensiveness, by which it rivalled even London humbug. There is scarcely, in short, a book of acknowledged merit in the circle of English literature that you cannot purchase, reprinted in Paris by Frenchmen, yet with great accuracy, for 8d., 10d., or, at the very utmost, 15d. In this most astonishing activity of the publishing world, a very marked preference is given to English literature, the German being little cultivated.—*Times.*

WHAT A MAN WILL DO FOR RELIGION.

Men will wrangle for religion; write for it; fight for it; die for it; any thing but—*live* for it.—*Lacon.*

FORGIVENESS.

The brave only know how to forgive; it is the most refined and generous pitch of virtue human nature can arrive at. Cowards have done good and kind actions—cowards have even fought, nay, sometimes conquered; but a coward never forgave: it is not in his nature; the power of doing it flows only from a strength and greatness of soul conscious of its own force and security, and above all the little temptations of resenting every fruitless attempt to interrupt its happiness.—*Sterne.*

INDUSTRY.

There is no art or science that is too difficult for industry to attain to; it is the gift of tongues, and makes a man understood and valued in all countries and by all nations; it is the philosopher's stone, that turns all metals, and even stones, into gold, and suffers not want to break into its dwelling; it is the north-west passage, that brings the merchant's ship as soon to him as he can desire. In a word, it conquers all enemies, and makes fortune itself pay contribution.—*Clarendon.*

* We of course demur to this, limiting ourselves, however, to the single remark, that the *Penny Cyclopædia* is a work which would do honour to any age or country.—*Ed. C. E. J.*

EDUCABILITY OF ANIMALS.

THIS is a subject on which, as far as we are aware, no attention has been bestowed in the way of scientific investigation. Yet such illustrations of it have been given, as would seem to point it out as a rich field for the philosophical naturalist. Regarding the endowments of animals as we generally do, it would be scarcely possible for us to believe some of the anecdotes which have been related on this point, if they were not, in general, authenticated in such a way as to preclude scepticism.

In the latter part of the last century, one Bisset, a native of Perth, by trade a shoemaker, having applied himself with great perseverance to the teaching of animals, succeeded in making a set of cats play in harmony on the dulcimer, uniting their voices to the tones of the instrument; and this singular orchestra was exhibited, to the perfect satisfaction of the public, for a succession of nights, in the Haymarket theatre. He it was who trained that "learned pig," of which our fathers used to speak so highly, the animal having been exhibited in every part of the empire. At a somewhat earlier period, a Saxon peasant boy trained a dog to the pronunciation of words. The boy had observed in the dog's voice an indistinct resemblance to certain sounds of the human voice, and was thus prompted to endeavour to teach him to speak. The animal was three years old at the beginning of his instructions, a circumstance which must have been unfavourable to the object; yet, by dint of great labour and perseverance, in three years the boy had taught it to articulate thirty words. It used to astonish its visiters by calling for tea, coffee, chocolate, &c.; but it is proper to remark that it required the words to be pronounced by its master beforehand, and it never appeared to become quite reconciled to the exhibitions which it was forced to make. The learned Leibnitz reported on this wonderful animal to the French Academy, attesting that he had seen the dog and heard it speak; so that there does not appear the slightest ground for doubting the fact, such as it was. All doubt on the question of possibility may, indeed, be considered as set at rest by the recent exhibition of the educated dogs in London—animals which could play at dominoes and chess, and even indicate when their adversaries made false moves. These creatures were visited and *played with* by thousands, and we never have heard that a deception of any kind as to the reality of their acquired powers was detected.

Laying aside such extraordinary examples as these, the ordinary training conferred on horses, dogs, and other domesticated animals, seems to be sufficient to establish the general fact of animal educability. We have no more forcible illustrations of the principle than in the uses which are now made of certain of the canine tribe in rural sports. The pointer, setter, springing spaniel, and all that class of dogs, are understood to be descended from one stock, the Spanish spaniel, with a slight crossing from the fox-hound, for the sake of improving the speed. The original animal may be considered as a record of the original powers, to which every thing else must be regarded as an addition made by human training. Now, the original animal is only gifted by nature with a fine scent for game, and a disposition to make a momentary pause on seeing it, for the purpose of springing upon it.* Man has converted this inclination to a temporary pause into a habit of making a full stop, and the animal, instead of gratifying his destructive tendency by flying upon the game, has been trained to be contented with witnessing a vicarious execution by the gun of his master.

It is a mistake to suppose that only the spaniel tribe is capable of serving sportsmen in the capacity of pointers and setters. There are other classes of dogs which perseverance would enable, to a certain extent, to act in the same way. Gervase Markham, who wrote on sports in the sixteenth century, speaks of having seen dogs of the bastard tumbler kind adapted to act as setters, though not so well as those of the spaniel kind. Mr Blaine is of opinion that this power can be cultivated in most dogs.* It has even been elicited in another and very different class of animals—the hog. Some years ago, Mr Toomer, gamekeeper to Sir Henry Mildmay, bethought him of teaching a pig to act as a pointer, having been struck by the scenting powers of the animal in its search for palatable roots under ground. He began by allowing a young female pig to accompany his pointers in their breaking lessons to the field. Within a fortnight, to his own surprise, she was able to hunt and point partridges and rabbits. There being an abundance of these creatures near the keeper's lodge, her education advanced rapidly by frequent exercise, and in a few weeks she was able to retrieve game as well as the best pointer. *Slut*, as this extraordinary animal was called, was considered to have a more acute scent than any pointer in the charge of the keeper; and it was a kennel of the highest character. They hunted her principally on moors and heaths; and it often happened, that when left behind, she would come of her own accord and join the pointers. "She has often stood a jack snipe when all the pointers had passed it: she would back the dogs when they pointed, but the dogs refused to back her until spoke to—Toomer's dogs being all trained to make a general halt when the word was given, whether any dog pointed or not, so that she has been frequently standing in the midst of a field of pointers. In consequence of the dogs being not much inclined to hunt when she was with them (for they dropped their sterns, and showed symptoms of jealousy), she did not very often accompany them, except for the novelty. Her pace was mostly a trot; she was seldom known to gallop, except when called to go out shooting; she would then come home off the forest at full stretch, and be as much elated as a dog at being shown the gun. She always expressed great pleasure when game, either dead or living, was placed before her. She has frequently stood a single partridge at forty yards' distance, her nose in a direct line to the bird; after standing some considerable time, she would drop like a setter, still keeping her nose in an exact line, and would continue in that position until the game moved: if it took wing, she would come up to the place, and draw slowly after it; and when the bird dropped, she would stand it as before."†

These facts, together with what common observation presents to us in domesticated parrots, blackbirds, ravens, magpies, monkeys, &c., place the educability of animals upon a basis, in our opinion, not to be shaken. But the most wonderful thing, and the most convincing part of the proof, remains, in the fact of the transmission of *acquired qualities* by animals to progeny. The habit which education has conferred upon the pointer appears in his puppy, who may be seen earnestly standing at swallows and pigeons in a farmyard, before he has ever once seen such a thing done by his seniors, or received the least instruction. Here only the object is amiss; the act itself is perfect. As may be readily supposed, the puppy of a race of English pointers can be trained to the whole business of the field, in one-tenth of the time which the most experienced breaker would require to effect any improvement upon the simple instinct of *the pause* in an original Spanish spaniel. On the subject of the hereditary transmission of acquired qualities by animals, we have some curious information from the venerable naturalist, Mr T. A. Knight.

In a communication to the Royal Society, in 1807, Mr Knight remarked the disposition of bees to seek for cavities in trees, where such existed, as places to swarm to, and surmised, that their taking up with the hives offered them is a result of domestication, which becomes inherent in those which have for several generations been under the care of man. To support this view, he cited several other instances of domesticated animals inheriting the acquired habits of their parents. "In all animals," he says, "this is observable; but in the dog it exists to a wonderful extent; and the offspring appears to inherit not only the passions and propensities, but even the resentments, of the family from which it springs. I ascertained that a terrier, whose parents had been in the habit of fighting with polecats, will instantly show every mark of anger when he first perceives the scent of that animal, though the animal itself be wholly concealed from his sight. A young spaniel brought up with the terriers showed no marks of emotion at the scent of the polecat, but it pursued a woodcock, the first time it saw one, with clamour and exultation: and a young pointer, which I am certain had never seen a partridge, stood trembling with anxiety, its eyes fixed, and its muscles rigid, when conducted into the midst of a covey of those birds. Yet each of these dogs are mere varieties of the same species, and to that species none of these habits are given by nature. The peculiarities of character can therefore be traced to no other source than the acquired habits of the parents, which are inherited by the offspring, and become what I call *instinctive hereditary propensities*."

It appears from another communication made by Mr Knight to the same society in 1837, that he had then been pursuing investigations on this subject for nearly sixty years. He proceeds in that communication to give a general account of his investigations. "At the period," he says, "at which my experiments commenced, well-bred and well-taught springing spaniels were abundant, and I readily obtained possession of as many as I wanted. I had at first no other object than that of obtaining dogs of great excellence; but within a very short time, some facts came under my observation which very strongly arrested my attention. In several instances, young and wholly inexperienced dogs appeared very nearly as expert in finding woodcocks as their experienced parents. The woods in which I was accustomed to shoot did not contain pheasants, nor much game of any other kind, and I therefore resolved never to shoot at any thing except woodcocks, conceiving that by so doing the hereditary propensities above mentioned would become more obvious and decided in the young and untaught animals; and I had the satisfaction, in more than one instance, to see some of these find as many woodcocks, and give tongue as correctly, as the best of my older dogs.

Woodcocks are driven in frosty weather, as is well known, to seek their food in springs and rills of unfrozen water, and I found that my old dogs knew about as well as I did the degree of frost which would drive the woodcocks to such places; and this knowledge proved very troublesome to me, for I could not sufficiently restrain them. I therefore left the old experienced dogs at home, and took only the wholly

* Thoughts and Recollections, by one of the Last Century. London: Murray. 1825.

* Encyclopedia of Rural Sports, 792.

† Daniel's Rural Sports.

inexperienced young dogs; but, to my astonishment, some of these, in several instances, confined themselves as closely to the unfrozen grounds as their parents would have done. When I first observed this, I suspected that woodcocks might have been upon the unfrozen ground during the preceding night; but I could not discover (as I think I should have done had this been the case) any traces of their having been there; and as I could not do so, I was led to conclude that the young dogs were guided by feelings and propensities similar to those of their parents.

The subjects of my observation in these cases were all the offspring of well-instructed parents, of five or six years old or more; and I thought it not improbable that instinctive hereditary propensities might be stronger in these than in the offspring of very young and inexperienced parents. Experience proved this opinion to be well founded, and led me to believe that these propensities might be made to cease to exist, and others to be given; and that the same breed of dogs which displayed so strongly an hereditary disposition to hunt after woodcocks, might be made ultimately to display a similar propensity to hunt after trufles; and it may, I think, be reasonably doubted whether any dog having the habits and propensities of the springing spaniel would ever have been known, if the art of shooting birds on the wing had not been acquired.

I possessed one young spaniel, of which the male parent, apparently a well-bred springing spaniel, had been taught to do a great number of extraordinary tricks, and of which the female parent was a well-bred springing spaniel; the puppy had been taught, before it came into my possession, a part of the accomplishments of its male parent. In one instance I had walked out with my gun and a servant, without any dog; and having seen a woodcock, I sent for the dog above mentioned, which the servant brought to me. A month afterwards, I sent my servant for it again, under similar circumstances, when it acted as if it had inferred that the track by which the servant had come from me would lead it to me. It left my servant within twenty yards of my house, and was with me in a very few minutes, though the distance which it had to run exceeded a mile. I repeated this experiment at different times, and after considerable intervals, and uniformly with the same results, the dog always coming to me without the servant. I could mention several other instances, nearly as singular, of the sagacity of this animal, which I imagined to have derived its extraordinary powers in some degree from the highly-cultivated intellect of its male parent."

Mr Knight states, that in sixty years he had observed the woodcock tribe become much more shy and wild than it formerly was, the result, he conceives, of "increased hereditary fear of man." This is certainly a result in conformity with the difference observed between birds in general in peopled and unpeopled countries, the former being shy from the youngest period of life, while the latter are tame and unsuspicious at all periods, until they become acquainted with the destructive propensities of man.

Mr Knight adds a few more cases, which he describes as but a sample of a vast number equally remarkable. We can only afford room for one, relating to a young dog of the variety called retrievers. He obtained a puppy of this breed, a month old, from a distant county, and said to be descended of a very well-bred family. "I had walked," he says, "up the side of the river which passes by my house in search of wild-ducks, when the dog above mentioned followed me unobserved, and contrary to my wishes, for it was too young for service, not being then quite ten months old. It had not received any other instruction than that of being taught to bring any floating body off a pond, and I do not think that it had ever done this more than three or four times. It walked very quietly behind my gamekeeper upon the opposite side of the river, and it looked on with apparent indifference whilst I killed a couple of mallards and a widgeon; but it leaped into the river on the gamekeeper pointing out the birds to it, and it brought them on shore, and to the feet of the gamekeeper, just as well as the best instructed old dog could have done. I subsequently shot a snipe, which fell into the middle of a large nearly stagnant pool of water, which was partially frozen over. I called the dog from the other side of the water, and caused it to see the snipe, which could not be done without difficulty; but, as soon as it saw it, it swam to it, brought it to me, laid it down at my feet, and again swam through the river to my gamekeeper. I never saw a dog of its age acquit itself so well, yet it was most certainly wholly untaught."

To conclude with dogs. A gentleman of our acquaintance, and of scientific acquirements, obtained some years ago a pup which had been produced in London by a female of the celebrated St Bernard's breed. The young animal was brought to Scotland, where it was never observed to give any particular tokens of a power of tracking footsteps until winter, when the ground became covered with snow. It *then* showed the most active inclination to follow footsteps; and so great was its power of doing so under these circumstances, that, when its master had crossed a field in the most curvilinear way, and caused other persons to cross his path in all directions, it nevertheless followed his course with the greatest precision. Here was a perfect revival of the habit of its Alpine fathers, with a degree of specialty as to external conditions, at which, it seems to us, we cannot sufficiently wonder.

The principle of what may be called a transmission of domesticated habits, is to be observed in other animals. "English sheep, probably from the richness of the pastures of that country, feed very much together; while Scotch sheep are obliged to extend and scatter themselves over their hills for the better discovery of food. Yet the English sheep, on being transferred to Scotland, keep their old habit of feeding in a mass, though so little adapted to their new country: so do their descendants; and the English sheep is not thoroughly naturalised into the necessities of his place till the third generation. The same thing may be observed as to the nature of his food that is observed in his mode of seeking it. When turnips were first introduced from England into Scotland, it was only the third generation which heartily adopted this diet, the first having been starved into an acquiescence in it."* The Norwegian pony is accustomed in his own country to obey the voice of his master, rather than the bridle: accordingly, when English-born progeny of this animal is taken in hand by a breaker, unusual difficulty is found in what is called *giving it a mouth*, although it is singularly docile and obedient. In Norway, the pony is accustomed to traverse unenclosed and almost pathless wilds: accordingly, the English-born progeny has no idea of such a thing as enclosures, and will be seen brushing through a hedge with the greatest coolness, as if no such thing were in its way. We have also been informed that the progeny of an American horse, introduced into England, ambles as American horses generally do, a kind of walk to which the English horse can only be trained with difficulty; and the same thing is observed as to the habit which the Irish horses have of leaping with their whole four feet off the ground at once, a movement occasioned by the numerous bogs which come in the way of an Irish horseman. This is a mode of leaping to which it would be as difficult to train an English foal, as it would be to prevent an Irish one from adopting it.

We thus see that not only does what metaphysicians call the *law of habit* exercise a sway in the intellects of animals, but that modification which takes place in human communities, and passes under the comprehensive name of civilisation, also affects the lower tribes of creation. A race of animals, like a race of men, is civilisable; and we cannot doubt that the same softening influences which have produced the advanced nations of Europe, have operated upon the animals existing in the same countries, and made them very different from what they were in early times. It cannot escape remark, that the whole principle of civilisation acquires strength from having its basis thus widened. We become the more confident in the improvability of our own species, when we find that even the lower animals are capable of being improved, through a succession of generations, by the constant presence of a meliorating agency.

THE PRIVATE PURSE.

BY MRS S. C. HALL.

PART II.

"How is it, Geraldine," said her mother to Mrs Leeson—"how is it that you and Henry are so changed in your manner to each other? Four years ago, I left you all affection; now, I find you hardly civil—this is very bad."

"It is," replied her daughter; "but it is not my fault. Henry is perpetually insulting, by asking me the most frivolous questions, and then sneering at my replies. He never believes a word I say. It was only yesterday he took our child on his knee, and read her such a homily on the beauty of truth that she looked at him, poor innocent, in fear and astonishment, without understanding his meaning, and then he looked at me. Oh! mother, I wish I had never married. It is very true what my aunt says—you never can know how a man will turn out."

"Your aunt, my dear, is a very bad counsellor. I fear she has caused mischief between you."

"Oh, no! but she told me how it would be. Why, before we were six months married, he took me to task about a chain! But that is nothing; I assure you he is niggardly in the extreme."

"You must be wrong, Geraldine," said her mother, earnestly; "indeed, you must be wrong. When I left you to go abroad—though I did not tell you so, lest it would make you unhappy—my finances were deplorably reduced. He questioned me upon them with the greatest delicacy; and when he found how I was circumstanced, as he was handing me into the carriage, he slipped a purse containing a hundred guineas into my hand."

Geraldine felt her colour change. "But how did he find that out, in the first instance?" she inquired, after a pause.

"I really do not know," replied her mother; "but you remember, dear, I was always a very bad dissembler. Your aunt says I can be seen through in a moment, which I dare say is the case, and I do not care about it. What does it matter when one has nothing to conceal? I never led him to suppose that you had a penny, or that I had sixpence beyond my small annuity; so I confessed that when I came to pay you the bridal visit, I had not five pounds in the world."

"Good heavens!" exclaimed Geraldine, the falsehood she had framed as to her mother giving her ten pounds towards the purchase of the chain, and the effect it must have had upon her husband's mind, flashing upon her for the first time. "Oh! mamma, why did you not tell me this before? What must my husband have thought of me?"

"Thought of *you*, my dear?" replied her mother, not understanding her allusion. "Why, what had you to do with it? He knew, as I have told you, perfectly well that you had nothing whatever to do with the matter; but I called it very handsome of him—very handsome indeed." And the lady resumed the perusal of her book, thinking it better to let this anecdote of her son-in-law's generosity operate of itself upon her daughter. Geraldine felt the blood rush to her head, and in another moment she was chill and trembling. She went to her own room, and traced back circumstance to circumstance. She saw clearly that on that evening she must have appeared guilty of duplicity. She remembered her husband's deep-seated and constant love and affection previous to that event; how her every wish was anticipated by him. She remembered how pleased, how happy he looked, when she gave him the five pounds she had saved from her housekeeping; and she could not but acknowledge that all the satisfaction she had received from her secret peculations had been gall and wormwood, in comparison to the approving smiles which she now knew how she had at first forfeited. Truly, her tears were many and sincere. She would willingly have retraced her steps had she known how; but she felt she had not strength to do so. She fancied confession more humiliating than deception; and, moreover, Henry's late unkindnesses were so numerous and so severe, that she forgot, when recalling them, how much was owing to the suspicions she herself had created.

She resolved to confide in her mother the particulars regarding the chain, hoping she should be able to prevail on her to say, if she was questioned on the subject, that she had borrowed the money to lend her; for, as I have said before, lies yield ample fruitage. She had of late mentioned some of her perplexities to her cousin; and here I am forced to pause, to observe that one of the most foolish acts of a young woman's life is the confiding in any man, either what she fears to intrust to her husband, or any complaint against him. It is almost always sure to betray itself; and if it does not, the step is so imprudent, so likely to lead to results affecting her character, and certainly to affect her conduct, that of all things it ought to be the most dreaded, the most avoided. It is seldom that a woman, resolved to bear and forbear, cannot succeed in winning her husband's friendship in the end. When this is really impossible—which I think can only be the case when a man is thoroughly unprincipled—may God help her! It is wiser for her not to complain of him she has sworn to "love, honour, and obey." Her own sex are, with a few most honourable exceptions, too feeble for friendship; and where there is youth and beauty, men are dangerous friends. It is wiser, then, I repeat, under such circumstances, for a woman to conceal her sorrows, and to alleviate them by active and duteous employment, rather than by idle and dangerous repinings. If scandal catches her character, injury will be, at best, sustained in setting it free; and the wretchedness of having been doubted, when forgotten by friends (if it ever be), is never unremembered by her upon whom suspicion has rested. The very reputation of having a male friend is injurious to a young English wife. It is only a vigorous mind that can bear being thus shut in with itself. A firm and noble one *will* bear it, because it is right; and perhaps, after years of firm endurance, be rewarded by the friendship it has so richly deserved—the friendship of *him* in whom a young heart trusted.

Geraldine loved her cousin really as a sister loves a brother; *but no more*. She had never bestowed upon him an atom of an affection that she need have blushed to own even to her husband; and though her cousin may be acquitted of all premeditated wrong towards her, he was not averse to being rallied on the preference evinced for him by his lovely relative. He assured every one "that it was a brother and sister affection"—that "it was impossible it could be any thing else, as they had been children together"—that "Geraldine was too devoted to her husband to indulge even a friendship for any one—except her cousin." But he did not say these things frankly, and seriously, and boldly, as it becomes a man of high honour to do; he said them with a smile or a shrug, or a *dolce* sort of self-satisfied expression, which made the careless young men of his acquaintance declare him a "lucky fellow," and married men say "that Leeson should look after his wife;" while matrons and old maids began to throw something of significance into their countenances when they observed that "they had met Mrs Leeson and her handsome cousin in the square;" and some were malicious enough to forget to add that she was accompanied also by her child or a female friend.

Most unhappily, her husband had become so irritable and suspicious, that she excused herself for her constant deceptions. He had long found it impossible to distinguish between her truth and falsehood; he had become unjust to her virtues; for she was a most devoted parent, while he believed that she was indifferent to her child. When she told the story of the

* Thoughts and Recollections.

chain—that origin of all the evil—to her mother, the old lady, instead of going at once to her son-in-law, explaining it to him, and showing that the advice of her aunt had caused her to step aside from the straight path—that it was *she* who urged her to form a private purse—and by this odious system undermined their mutual confidence; instead of doing this, she set herself to frame a "reason for the lie." And why? Because the little girl was the aunt's god-child, and she solaced herself, by determining that "she would certainly leave her all she had, if she were not displeased; but if Geraldine broke her word—if she forgot that she had promised not to tell—all the previous concealments would have been made in vain, and they would lose the property. Henry would be sure to 'fly out' about it, and what would be the end of it?" The good lady quite forgot that Geraldine had promised to conceal the gift from her, as well as from her husband; but her ideas of right and wrong could all be set aside by interest; we have wonderful tendernesses towards those who break their words for our especial sakes. Geraldine was, in point of fact, incapacitated, in the sight of God, from making the promise her aunt required of her, on the morning of her marriage; because the OATH, so important and so engrossing, which she had taken at the altar, virtually delegated her husband the depositary of her acts, thoughts, and secrets.

How despicable a picture of human nature does this perpetual bowing down to Mammon pourtray! and how vain and insignificant does it appear, when contrasted with so high, so holy a thing as truth! Oh! if those who are heedless of words and their import, did but know the inestimable value of this "bright ornament"—if they had but traced, as I have done during my pilgrimage of observation through life, the cares, and toils, and tangled weariness that *must* follow in the train of falsehood, however small it may appear at first—if they could witness the contempt that dogs the liar to a despised grave—if they could see the family disunions, the heart-beatings and heart-breakings, originating in an untruth, no larger than that grain of mustard-seed that became an outspreading tree—if they could be brought to feel the base, mean, paltry cowardice of a lie—how earnestly they would pray to be delivered from its insidious temptation!

Geraldine's mother, I have already said, was exactly one of those who had neither been educated to become a mother, nor in the knowledge to teach the duties of domestic life to her child. She was, like scores of others, weak, warm, and as brainless as a woman could well be, who went through the etiquettes of life with propriety and exactness. She thought herself acting with extraordinary tact and discretion, when she entered the small library where Mr Leeson sat by himself when at home in the evening, and, shutting the door with a peculiarly silent and mysterious air, asked if she might intrude upon him for a few moments. He placed a chair for her, and, laying down his book, prepared to listen.

Henry Leeson was more changed than men usually are in years so few, and yet he dressed better, was quite as handsome, when in society conversed more fluently, many thought more agreeably, for a dash of vinegar curdled the oil, and rendered him pungent and racy. But his features had lost their affectionate, confiding, easy expression; his face had grown sharp as a lawyer's seeking flaws in an indictment; he could not sit for five minutes looking straight forward, but twisted his eyes to see sideways, and his head to look behind—he had grown suspicious.

The old lady had a difficult card to play, and, of course, played it badly, floundering through muddy sentences, until at last she ventured to regret "that her dear Harry had not been in the drawing-room—he used to be so fond of music—and she had prevailed on Geraldine to sing; and Arthur Harewell said he had never heard her in better voice."

Mr Leeson muttered something about a new book, and Arthur understanding music better than he did, as he heard more of it. And this was answered by an observation, "that more was the pity." And then the gentleman sat, and the lady fidgeted through a long pause—until, with tears of very sincere grief, she declared, in her own simple way, her regrets that two so much attached as her dear son and daughter "were" (Mr Leeson shook his head)—"had been," then substituted the sorrowing mother—were now so estranged "without any cause."

Mr Leeson stiffly said, that "if there had not been cause, there would have been no estrangement—the fault was none of his."

The old lady hit upon one sensible observation by chance—"that in quarrels matrimonial, both parties were generally to blame."

He bowed; and answered, "It might be so, in a degree."

"For instance," she continued, "you were very angry with her long ago, I find, about a foolish chain; and really, Harry, dear, you had no reason."

"The chain was in itself as unoffending," he replied, "as trinkets generally are; but I *had* reason. She told me a falsehood as to her means of purchase. The chain was a gift; yet she assured me she bought it. I have but too good reason to remember it, as the commencement of all our misery. Why, she even used *your name* as the giver of part of the purchase-money."

"And so I was," murmured forth the feeble-minded woman, unable to raise her eyes; but keeping down the truth by the weight of her sister's riches.

"Nay!" he exclaimed; "how could that be, when you yourself —— But you must remember certain passages which prevent a possibility of that."

"She wished so for the chain," said the old lady, "that I borrowed ten pounds to make up the money."

Mr Leeson rose from his seat in wrathful indignation, and but that the being before him was a frail aged woman, could not have contained himself. "You really must excuse me for saying I doubt this. I should, indeed, grieve to feel that those grey hairs were dishonoured by a falsehood, to screen a child who has no feeling for herself."

Self-degradation forced itself upon the feeble-minded mother, and she only said that she hoped he "would permit her still farther to explain."

"Pardon me," he replied, "if I decline any future conversation upon this subject. When I married Geraldine, I imagined I read in the brightness of her sunny face the brightness of truth. I loved her with the entire fullness of my heart. I would have trusted her with my life; I *had* trusted her with more—for every man when he marries trusts his wife with his honour. I pictured long years of enduring affection; and, above all, in return for the most devoted love that man can feel towards woman, I asked for her confidence, her *unbroken* confidence. Nothing else could satisfy me. It must be frank—spontaneous—untainted. My conviction is, that UNMITIGATED TRUTH *is the stronghold of domestic happiness.* She *knew* that such was my opinion; she had heard me say a hundred times that sooner or later sin followed concealment. I did not want my wife to appeal to me on every occasion, or feel it necessary to render an account of her personal expenses; such details are irksome to a man; but I expected that she should have no interest apart from mine—no expenditure that was to be considered private—no stealing from a house purse, to put into one called, for distinction's sake, 'her own.' Mine was at all times open to her hand. If I urged upon her the investigation of accounts, it was only to lead her to those habits of exactness which are inseparable from sound domestic management. I remember how my heart beat with joy, when she brought me the savings of her early housekeeping; if it had been thousands, instead of pounds, I could not have rejoiced more sincerely; it was a proof of frankness on the very point upon which I had depended so much. I felt I had a sweet confiding friend, and that our interests were the same. How soon this changed, I also well remember" —— He paused; and then abruptly added, "What need she have denied that her cousin Arthur gave her that chain?"

"Indeed," exclaimed her mother, earnestly; "indeed, indeed, you do her wrong; Arthur never gave it her. If you have for so long a time indulged this injustice, no wonder you have made her and yourself so wretched."

"My dear lady," replied Mr Leeson, calm even to bitterness, "I *know* he did; and in the gift, or the taking, there was no sin; but there *was* sin in the lie. It destroyed my confidence in her; it implanted the vile weed *suspicion* in my bosom; and ever since, as if a spell were round her, she has heaped duplicity upon duplicity, until now, I could not believe truth to be truth coming from her lips." It was most painful to observe the agitation of his feelings speaking in his eloquent face. "I believe," he added, "I hope and trust, she is free of all other sin; I *hope* it; I—I—believe it; but I cannot believe HER. It was only this very day I came to the determination of removing our child from an influence which must in the end destroy her, as it has destroyed her mother."

"You are not surely going to be guilty of the cruelty of taking her child from her!" ejaculated its grandmother; "you cannot be in earnest. What will even her friends think? Oh! Henry, you would not brand my child as unfit to be a mother! What would the world say?"

"Madam," he replied, "there is a higher tribunal than *that*, where parents will be called upon to give an account of the children committed to their care. Mine is already practised in deception. If I say one thing, and my wife teaches another, what can be expected but that our child will in her turn deceive us both."

"You are too severe; indeed, you are," reiterated the poor lady, who had altogether lost sight of her first object in this fresh trouble, and did not seem to understand how much she had added to the evil feeling she thought to obliterate by her poor subterfuge. Oh! Henry, dear Henry, remember how you loved her!"

"If," answered the afflicted husband, "if I could forget that, I should not suffer as I do."

"Had she been a faithless wife, you could not punish her more severely than you propose to do."

"There are various kinds of infidelity not recognised by law," he replied. "If I believed her guilty in the sense you mean, she should not shelter for a moment here; and yet there are men, who, with less show of cause, have branded their wives. Now, do not agitate yourself on *that* score; I make no charge against her. I believe her pure; but where is the tender faith, the confiding love, THE TRUTH, that should be the woman's THRONE. However, my dream is past; my resolution taken. I will do my best to prevent any man being deceived by my child, as I have been deceived by *her*. You are, perhaps, the most fit person to tell your daughter of my determination. In removing my child, I remove the joy, the light, the solace, of my own existence; but it is for her own good. She shall not return until her principles are fixed, or her mother's course of conduct entirely changed."

Unfortunately, Mr Leeson had selected a powerless messenger, who, of course, inclined to the other side, and who felt keenly, what even the most silly women feel, the love of offspring. Instead of keeping secret as the grave her son-in-law's intention, with garrulous weakness she sought sympathy from those hundred and one "dear friends," who immediately set their own versions of the story afloat; and while but a few saw and understood the father's intention, the mass "conjectured" and "hinted" the "real reason." "Poor Mr Leeson! how generous of him to overlook what had occurred, and keep *her* (his wife) in his house; no wonder he should remove his child; of course, *her* mother would make the best of it;" and so forth.

Geraldine looked upon her husband's resolve as an act of wanton tyranny and cruelty. Having ceased to honour the straightforward truth, she could not believe the one stated to be the true reason of his determination, and, blinded by sorrow and anger, she induced her cousin Arthur to interfere. Women talk and talk, outrage and anger each other, and their words are as nought. Who heeds or cares for them after they are spoken? But men's words are uttered to be remembered and acted upon. Mr Leeson was indignant at any man presuming to interfere in his domestic concerns. Words succeeded each other with angry rapidity, until neither could call to mind how the unfortunate chain was first alluded to. Arthur Harewell, *then*, boldly and fearlessly declared that he never gave it to his cousin; upon which Mr Leeson gave him the lie direct. The usual consequences followed. Arthur Harewell received a ball in his shoulder, and Mr Leeson, also wounded, was conveyed home, where his agonised wife, throwing herself on her knees by his side, bitterly lamented that her aunt's gift had been so fatal. Now, indeed, she spoke the truth. The sight of her first and only love, his lacerated arm bleeding, and his features white as a maiden's shroud, recalled her better nature. What, in that hour, did she care for her aunt's displeasure?—what for the wealth her sordid fingers had grappled together? She believed HE was dying, and dying with the conviction of her utter worthlessness. She did not even seek to extenuate her own fault, while she traced it to its origin; and yet *there*, on her knees, while pouring out her soul in sincerity and truth, she saw she was not believed.

How could she convince him? In a state bordering on frenzy she wrote to her aunt, imploring her to ratify her words, acknowledging her kindness towards herself, but showing what its effects had been. To this appeal she received no answer. The proof, however, that she was able to lay before her husband, at last convinced him that her first fault—her first falsehood—did not originate in herself. Before he rose from his sick-bed, for mental agitation, combined with his wound, terminated in fever, her aunt had died; and her mother was certainly the only one of the family who regretted to find that the legacy she left her niece was characteristic of her sarcasm. "And to my niece, Geraldine Leeson, I give and bequeath, instead of the whole of my property, as I had intended, the sum of one shilling, to buy a padlock for her foolish lips."

I wish I could say here, after the most approved novel fashion, that, so reconciled, Mr and Mrs Leeson lived happily together to the end of their days. Not so. Henry Leeson, though a strict, was a high-minded and generous man, and with such a character even his erring wife was safe from reproach; but the effect of years of misconduct, of *any* kind, cannot be obliterated by sorrow. Repentance works well for the penitent, but the world is little cognisant thereof. The duel had stamped Geraldine in the eyes of that world as a woman, if not of sin, of levity; this in truth in a married woman is so closely akin to sin, that there is but one Power which can discern the difference. When familiar faces turned aside as she passed, when she walked up the steps of the parish church ungreeted, her husband was by her side, and she felt her arm as closely pressed to his heart as when he supported her, a lovely, loving bride, from the altar; but even then she felt indebted to his generosity. She knew that his confidence, though she hoped returning, had not returned. When to prove to the world his perfect conviction as to the virtue of his wife, he paraded town leaning upon Arthur Harewell's arm, the knowledge of the necessity for such conduct made her ashamed of her own shadow.

"Take my child from me now, Harry," she said, with bitter, bitter tears, and her head bent almost to his feet, "and I will not complain. Send her where some one of higher and holier mind will strengthen and stablish her in what is right. Send her where the duties of her sex and station will be brought clearly before her eyes, and where there is no danger of her confounding right and wrong. At any sacrifice of my own, I would save her from the sufferings I have inflicted and endured."

This, indeed, was the language of truth, and Henry felt it, and rejoiced; but his joy was sobered by the knowledge, the fearful knowledge, of what the world said, and the dread that she did not yet understand the perfect and entire union of interests necessary to the happiness of domestic life. Union of sympathies is the happy effect of chance, but a union of interests is a positive duty; and so at last Geraldine felt it.

Time passed on. Mr Leeson, although he despised the feeble mind of his wife's mother, and kept her out of the way of her grandchild, ministered liberally to her necessities. His daughter grew up in mind all that the fondest parent could desire, although her fragile form and sensitive face told of constitutional delicacy; and he had almost forgotten that ever he doubted his wife's truth. They had removed into a new neighbourhood, and formed new friends. The son of one of these, a man of high rank, was paying his addresses to their daughter; and not only were the young girl's affections engaged, but both parents were delighted at the prospect of her happiness.

Father and son were dining one day at Mr Leeson's splendid country seat, when the old gentleman, who was chiefly remarkable for extreme propriety, and was moreover exceedingly deaf, said, as they were chatting over dessert, "By the way, Leeson, my cousin, Sir George, was telling me an odd story about a person of your name, no relation I suppose—eh?" Mr Leeson did not know. "No; but it could not be—very improper indeed if it was. Leeson is a *general*, I do not mean to say a *common* name, but a general one. Something about an affair that ought to have given employment to the gentlemen of the

long robe; but the lady, who was a dreadful story-teller, managed to convince her husband of her innocence, though she convinced nobody else. And only fancy, by Jove! the husband parading St James's Street arm-in-arm with the very cousin whom he had winged! Now, did you ever hear any thing so absurd? How the fellows at the club windows must have laughed!"

Poor Mrs Leeson! After the lapse of years, to hear this at such a moment! She was carried out of the room fainting. An explanation followed, and the match was, at least for a time, broken off.

The shock was of too severe a nature to be endured by so gentle and tender minded a girl as Miss Leeson. She had known her mother only as good and pure. She had been more proud of her character and virtue than of any thing else in the whole world; but after that fatal dinner she never spoke upon the subject, nor asked a question, until at the very last. Within an hour of her death (and she died within a month), raising herself on her pillow, while her parents were at either side, she folded her arm round her father's neck, and drawing his ear close to her lips, whispered, "Tell me, father—tell me truth—was *she* guilty?"

"No, dearest—God knows, she was not."

The girl's face became radiant with joy, and the last word she spoke was a repetition of the sound she loved so well—"My mother!—my mother!—my mother!" And then she passed away, as the leaves from the summer cistus, as fragile and as fair—the first rough blast of a rough world had borne her to the earth.

For years and years her parents lived, two mourning creatures, he strengthening her, and she, patient and silent, save to the young, whom she counselled, as I do you—that when you wed, do it not lightly; but when done, endeavour as much as lieth in you to be of one mind and one interest in all things.

THE LIFE AND POETRY OF HORACE.

FIRST ARTICLE.

Quintus Horatius Flaccus, better known by the Anglicised form of his family name, *Horace*, was born at Venusium, a town of Apulia, on the 8th of December B.C. 65. Of his childhood, he himself relates an incident to which his own fancy has lent a fine tinge of romance. Wandering in the mountainous district near his father's farm, he fell asleep, tired with play; reposed unhurt by the vipers or beasts of prey with which the place abounded; and seems to have been found covered with leaves. His immunity from peril he considers miraculous; and the leaves, which had probably dropped from some tree beneath which he had stretched himself, he chooses to regard as the gift of the wood-pigeons. The fine parts of the future poet soon became apparent to the quick eye of parental partiality. In order to procure him the best instructors, his father, who was only a freedman, quitted Venusium for the capital. Obtaining employment as a collector of taxes, he placed his son, at considerable expense, under Orbilius Pupillus, an eminent grammarian, who initiated him into the native and Grecian literature. The poet, praising the paternal generosity, thus playfully adverts to the economy of the provincial school:—"My father was the cause of these good qualities I am claiming; for, though only the poor proprietor of a little patch of land, he was unwilling to send me to Flavius' school, whither, on pay day, the great sons of great centurions used to bring their wages, slate and satchel swung over their left arm; but had the spirit to fetch his boy to Rome, to be taught like the children of knights and senators." Not contented, however, with providing for the youth's intellectual accomplishment, this excellent man maintained a strict superintendence over his morals—a superintendence gratefully remembered and recorded by his son. When about twenty-one, Horace was sent to Athens, to finish his education. In that seat of learning, to which he reverts with much fondness, he was instructed in ethical and geometrical science; and paced, in company with the son of Cicero, and other students of note, the venerable groves of the Academy. He does not appear, however, to have thoroughly imbibed the tenets of any philosophical sect—his leanings to the doctrines of Epicurus being less the result of inquiry and conviction than of the easy luxuriousness of his natural temperament. From these quiet scenes he was soon removed, and induced to take part in the turmoil of the times. In the civil war which ensued on the assassination of Cæsar, he joined, at the summons of Brutus, the popular party; served about two years in the republican army; obtained promotion to the rank of tribune; and was present at the rout of Philippi. To his shameful behaviour on that occasion he himself repeatedly alludes. Acting on the maxim that

> "He who fights and runs away,
> May live to fight some other day,"

he, like the Greek lyrist Alcæus, in a similar predicament, threw down his shield, and sought safety in flight. The amnesty proclaimed by the victors secured his person from danger, but provided no reparation for his ruined fortunes. On his return to Rome, he found his father dead, and his little patrimony exhausted or confiscated. Not only deprived of an inheritance, but even destitute of a home, the poet was forced to fall back on the resources of his own genius. Nor was he suffered to remain long in obscurity and indigence. Virgil and Varius, with both of whom he afterwards lived on terms of intimacy, successively negotiated for him the good offices of Mæcenas, the favourite minister of Augustus. Being admitted to a conference, his ingenuous avowals and modest demeanour effectually corroborated the recommendations of his friends. Between the first and second interview, however, nine months were permitted to intervene. At the end of that period he was at once placed on a footing of intimacy with his patron, who, besides providing him with an elegant competence from his own private resources, speedily secured him the favour of the emperor. For about thirty years, fortune continued to smile steadily on Horace. The long calm was broken by the death of Mæcenas—a blow from which his friend never recovered. The poet died towards the close of B.C. 8, aged fifty-seven, so soon after his benefactor, that he has been generally accused of shortening his life by poison. There is, however, no sufficient ground for this serious imputation. The expressions cited in support of it from the seventeenth ode of the second book, are merely the commonplaces of strong affection; and his proved timidity, his relish of social pleasures, and the whole tone and complexion of his character, unite to acquit him of the crime of suicide. He was buried on the Esquiline Hill, beside the grave of Mæcenas.

Horace could not boast of a poetical exterior. His person was diminutive in stature, and a disease of the eyes did not by any means render his countenance attractive. Of his modes of living, both in town and country, he has given some interesting details. Even in the city, although free in his hospitality, and fond of the society and conversation of his friends, his furniture was homely and his repasts frugal. His ordinary relaxations, his domestic economy, and the distribution of his time, are thus described:—"Wherever I have a mind, I saunter alone; I inquire the prices of vegetables and corn; I lounge often of an evening about the Circus, that resort of rogues, and the Forum; I stand and listen to the fortune-tellers; then I go home to a dish of onions, pulse, and pancakes. Three slaves serve up my supper; then I retire to rest, and being no way concerned about getting up in the morning, lie in bed till ten. Afterwards, I take my ramble; or, when I have read or written privately as much as I choose, am rubbed over with oil. After diversions and bath, I partake a slight refreshment, and then idle away the afternoon at home." He was always glad, however, to escape from his town residence to his villa at Tibur, or his Sabine farm, both the gifts of Mæcenas; a preference which grew more decided as he advanced in life. Cowper himself does not betray a more exquisite relish for rural pleasures, or present a more delicious picture of them. The seasons of civic gaiety and dissipation were always gladly exchanged by our poet for the plain diet, the untainted sunbeams, the fresh green fields, and the quiet siesta on the margin of a rivulet; and the rustics, as he tells us, would sometimes smile when they saw him handling the hoe. His journeys were usually performed on a little cross mule, to which, it seems, the rider and his portmanteau were equally galling. When residing at any of the fashionable bathing-places, Horace seems to have been more fastidious respecting accommodation than when at home, and also to have indulged himself in a more generous regimen.

Our poet was warm in his friendships; and there must have been much to love as well as to admire in the man whom Mæcenas, after an intimacy of thirty years, could commend in these affecting terms to his imperial master: "Be mindful of Horace, as you would of me." He was, notwithstanding, somewhat testy, and excessively timorous. The latter disposition is evinced, not only by his flight at Philippi, but by his oft-repeated execrations of a tree, the falling of which, while he was walking in his garden, had nearly proved fatal to him. The former characteristic he frankly owns to; and his narrative of a certain rencounter with a *bore* forms a humorous commentary on the confession. If readily offended, however, he was as readily appeased; his forgiveness was equally prompt with his resentment. Of either vanity or meanness Horace cannot be justly accused. Although fond of books, and not insensible to his own reputation, he does not seem to have put on the airs of the *litterateur*; and his liberal praise of Augustus and his minister, is rather to be viewed as the tribute of gratitude than as the incense of servility. From the charge of slothfulness he will not be so easily vindicated. So jealous was he of aught that might impair his ease, that he declined the emperor's solicitation to act as his private amanuensis. Choosing generally to disguise his indolence as contentment, he sometimes freely avows it. Speaking of his early struggles, he states that "stern necessity urged him on to the composition of verses; but now," he adds, "having a competence, I prefer sleeping to scribbling!" If we advert to the inferior features of the poet's character, we can only wonder at the joint existence in the same mind of so much grossness and so much genius; and are half constrained to rank the possessor of qualities so antagonistic and apparently incongruous with that depraved though gifted class so emphatically described by perhaps its most conspicuous member, as exhibiting, in strange and unnatural alliance, "delicacy, coarseness, sentiment, sensuality, soaring and grovelling, dirt and deity."*

The *lyrical* compositions of Horace comprise four books of odes, one book of epodes, and the Secular Hymn; in all, a hundred and twenty-one distinct pieces. Of a few of these we proceed to present the reader with original versions. The moral of the ode which we first present, though the respective inferences are widely different, comes recommended by the very highest authority—"Take no thought for the morrow, for the morrow shall take thought for the things of itself." The poet entreats the person he calls Leuconoe to abstain from fruitless efforts to discover, by the help of the astrologers, the limits of his life or her own.

TO LEUCONOE.

'Tis impious: seek not thou to know
The doom that waits thyself or me;
Chaldea's mystic art forego,
Inquisitive Leuconoe!

'Tis better far in peace to 'bide
Whate'er may be for each in store;
To take content, whate'er betide,
Yet not to feel the ill before.

Whether the winter be our last,
That sendeth now, to lash the shore,
The Tyrrhene sea, with angry blast,
Or Heaven in kindness wills us more.

Be wise: strain off the wine, and seek
In prudence' scales thy schemes to cast:
Brief, brief is life; e'en as we speak,
The churl Time posts forward fast.

Seize, then, to-day, and save it free
From carking care or paling sorrow:
Jocund and gay to-day be we,
Nor trust a whit the false to-morrow.

—B. I. 11.

In the next ode, Horace, under the guise of allegory, warns the state of some impending peril. The poem, which appears to be an imitation from the Greek, is by some referred to the contemplated resignation by Augustus of the sovereign authority; by others, with more probability, to the civil war between that prince and Antony, which, on this hypothesis, would be on the eve of breaking out at the time when it was written.

TO THE REPUBLIC.

Oh, tempest-toss'd! must other waves
Still bear thee back to open sea?
Hark! how the storm still howls and raves;
Hold thou the harbour steadfastly.

Seest thou thy crew their oars have left?
What may thy crippled mast avail?
Thy sail-yards creak; and, anchor-reft,
How wilt thou ride the lordly gale?

Thy canvass shreds; swept off their shrine,
The gods whom thou wert wont to call;*
Although thy planks are noble pine,
Of Pontus' forests, vain is all.

Thy blazon'd stern will ne'er infuse
Hope in the timid mariner;
The winds are up! Unless you choose
To be their laughing-stock—beware!

Thou object of my fondest care,
I warn thee shun the dangerous seas,
That dance so fair, a sparkling snare,
Among the marble Cyclades!

—B. I. 14.

Our next specimen is in the lyrist's finest vein. His "purpose seems to be to turn Licinius from some precipitate act, and to press upon him the wisdom of moderation."† The reader will remark that the image applied throughout the preceding ode to the position of the commonwealth, gains in beauty as descriptive of the fortunes of an individual; being, in the latter instance, relieved and kept from palling, by its association with other appropriate similes.

TO LICINIUS.

Licinius! list my friendly lore;
Nor dare the deep when tempests roar,
Nor over wary hug the shore
That wrecks full oft the mariner.

For him who loves the golden mean
Nor sordid hovel spreads its screen,
Nor lordly hall attracts, I ween,
The jaundiced eye of jealousy.

Low stoops the pine that tapers tall,
Topple high towers while stand the small,
And heaven's red bolts in fury fall
Full on the cliff's proud pinnacle.

The man of firm and prudent breast,
When evil comes, still hopes the best;
When good, still steels him for the test
Of dark and pinching poverty.

Jove wills hoar Winter's icy reign,
Yet sends the jocund Spring again;
Once more laughs blithely forth the plain,
And flow'rets cluster cheerily.

The grief that clouds thy brow to-day
To-morrow's dawn may chase away:
Apollo loves the lyre and lay,
Nor bends his bow unceasingly.

When evil frowns, nor faint nor quail,
Yet reef betimes the swelling sail,
When blows too hard the favouring gale,
That wafts thee on so speedily.

B. II. 10.

Fancy has seldom acted, with a better grace, the part of handmaid to Prudence.

In the verses which follow, and which form the exordium of an ode too long to be presented entire, the poet launches into the praise of fortitude, the virtue which so often, in ancient times, "raised a mortal to the skies." Augustus, deified by anticipa-

* Byron's Diary

* "Alluding to the tutelary deities, whose images were accustomed to be placed, together with a small altar, in the stern of the vessel."—*Anthon.*

† Pemble.

tion, is classed with the heroes whose valour had won for them exemption from the common lot of humanity. Than the opening stanzas, there is no grander burst in the whole compass of lyric poetry.

> The man whose nerve stern virtue strings,
> Firm by his lofty purpose clings;
> Quails not beneath the scowl of kings,
> And braves the rude democracy.
>
> That lordly soul nor sees with dread
> The gale lash Adria's billowy bed,
> Nor, hissing from his right hand red,
> The bolt of heaven's high Thunderer.
>
> Be earth's big orb asunder riven!
> Crash too the azure roof of heaven!
> Down on his head the wreck be driven!
> 'Twill smite him smiling panicless.
>
> Upborne by virtue, Leda's son—
> Alcides—each his honours won;
> Each trod the empyrean on,
> And storm'd the starry citadels.
>
> Rome's lord the heroes leans beside,
> Where high they feast in godlike pride,
> Quaffs, purple-lipp'd, the nectar's tide,
> And holds celestial revelry.
>
> Thus, too, Sire Bacchus tamed of yore
> And yoked the tigers fierce before,
> And Mars' hot steeds Quirinus bore
> Far from the flood of Acheron.
>
> —B. III. 3.

Respecting the carousals of demigods and heroes, the reader will note the difference between the classic creed and the ferocious superstitions of the North.

The *Epodes* possibly derive their name from being published *after* the odes, to which they form a sort of supplement. They may perhaps be regarded as the connecting link between those compositions of their author, the subject as well as structure of which is strictly lyrical, and the satires and epistles. Some of them are grossly scurrilous, others rankly impure, and, taken as a whole, even in respect of poetical merit, the book of epodes is far inferior to the preceding collections.

The magnificent national anthem, composed at the request of Augustus, to be chanted at the secular games, the fifth celebration of which fell during his reign, is too long to be here translated entire, and the beauty of its fabric would vanish in a fragment.

We now conclude, therefore, the present article, in which we have glanced at Horace as a lyrist. In our next we shall proceed to view him as a satirist and a writer of epistles.

A FEW WEEKS ON THE CONTINENT.

BERNE.

Our journey from Thun to Berne, a distance of about sixteen miles in a north-westerly direction, was performed in one of the public diligences, a well-appointed vehicle of the French form, in which our places cost but the moderate sum of three francs each, with no extra payment at arrival from either driver or conducteur. The route lay through one of the most pleasing rural scenes in Switzerland, being chiefly within the valley of the Aar, and often at a short distance from that beautiful stream. As we advanced from the great hilly region in the vicinity of Thun, the country became more agricultural, and under a better system of tillage. The farm-house establishments were also on a larger scale, indicating the possession of capital and a more extensive system of farming than in other quarters of the country. We passed likewise numerous manufactories of the coarse kind of earthenware for which Switzerland is celebrated, and which is seen almost every where on the continent.

Berne is in some respects to be called the capital of Switzerland; for although only honoured as the seat of the federal diet alternately with Zurich and Lucerne, in order to prevent its rising into undue importance, it is the chief place of residence of foreign ambassadors, and the centre of one of the most populous and wealthy cantons. It occupies a very remarkable situation, on a high peninsula, connected on the west with the surrounding country, but separated from it on the south, east, and north, by the broad current of the Aar. The peninsula declines considerably on its eastern extremity; and here, entering from Thun, the road, after descending a steep bank, crosses by a bridge into the lower quarter of the city, and then proceeds by a toilsome ascent to the main street. At the period of our visit, a lofty new bridge was in progress of erection, which, when finished, will greatly obviate the difficulty of the access. Constructed on this peninsular situation, for the sake of defence in an age in which *faustrecht*, or the law of the strong-hand, predominated, the whole town partakes of the character of a fortification. The houses, substantially built of a grey sandstone, seem as if designed to last for ever, and, like those which we see in the older parts of Edinburgh, rise to a height of five, six, or seven floors, exclusive of a storey or two under ground, and are crammed with inhabitants from cellar to garret.

The scene which we encountered on entering the city was curious and striking. No sooner had we rattled through the old portal, at which a soldier stood on guard, than the vehicle had to toil its way up a long steep street, choked with people, horses, cattle, carts, gigs, stalls, and other encumbrances; and always the farther up the crowding was the more dense, till, on arriving at the level thoroughfare above, the horses and vehicles diminished in numbers, and there being only men and women to contend against, the diligence was permitted somewhat more freely to reach the place of its destination. Having speedily settled ourselves at a hotel, we hastened out to observe the spectacle in all its details. It was the weekly market-day, and it is only on such occasions that a Swiss town possesses the least air of bustle.

The country at large, as I formerly hinted, is very much in the condition of Scotland a century ago; with this difference, that it possesses no class equivalent to our landed gentry, or indeed any class—some merchants and manufacturers excepted—above a plain set of what we should call in England cottage farmers. We had seen how these agriculturists toiled in their fields, and had noticed their primitive mode of living in their old-fashioned and not very cleanly mansions; now, we had an opportunity of seeing them in holiday attire, and observing how they conducted themselves when exposed to the attractions of a capital. As the Bernese agriculturists stand at the head of the Swiss farming class, the opportunity was prized accordingly. We hear much in England of Swiss costumes, but not a little nonsense is afloat on this subject. Nine-tenths of all the females one sees in the country parts, at least in any of the cantons I was in, are dressed like our Highland shearers—a plain kind of blue or brown woollen material, forming jacket and petticoat, being the ordinary wear, while the men are no better, but are uniformly dressed in coat and trowsers of the coarsest woollen cloths. It is only on Sundays and holidays that any thing like peculiar costume is observable, and is in any case confined to females. To all appearance, every particle of ordinary male and female attire, from head to heel, is made at home; and only the extraordinary, such as a few trappings for market-days and great occasions, are bought in shops. All the Bernese women, dressed as we now saw them, wore on the neck a black cotton velvet lappet, held down loosely by a steel chain passing below each arm, from back to breast; and their heads were decorated with boughs of black ribbons and broad black lace—the latter pronounced by the ladies of our party to be of the true kind, and the only expensive article which was worn. To all appearance, the whole people, men and women, were accustomed to laborious country labour, but they were clean; and the great number of horses and cars waiting their return home, showed that many of them were in good circumstances. There was a vast profusion of goods of different kinds spread out in stalls inviting purchasers; but almost every thing was of a plain nature, and chiefly, I should think, of Swiss manufacture. From the number of stalls for the sale of pieces of leather, it was pretty evident that making and mending their own shoes formed as much an object of attention to the farmers at their cottage fireside, as was the preparation of the coarse fabrics used in their personal clothing.

In the upper and more open part of the town, there was a large market for cows and cattle generally; and here we were amused with the number of stalls at which bells were sold for hanging round the necks of the animals. The practice of tying a bell to the neck of a leader of the herd, is common all over the higher parts of Switzerland; and the tinkling sounds which you hear from these bells while travelling in Alpine tracts, have a peculiarly pleasing effect. On the present occasion, it was a Babel of bell-ringing, for the purchasers required to make their selection so as to avoid a confusion of tones.

To those who are accustomed to associate the beau-ideal of farming with broad cloth and top-boots, the homely guise of the Bernese farming population would have appeared inexpressibly ridiculous. Yet it afforded a picture of a social condition anything but contemptible. The people were decent and orderly; we saw nowhere the least appearance of poverty or wretchedness, such as stares one in the face at any hour of the day in Edinburgh; we saw no drunkenness, such as is observable every where at English fairs; and we were told that bankruptcy among these people is scarcely ever heard of.* In short, such a scene of substantial mediocrity of condition is perhaps not to be matched out of Switzerland; where, if there be no farming on a grand scale, as with us, society at all events remains better balanced, and the eye is neither startled with great splendour nor shocked with the spectacle of unmitigated misery.

The *grand rue*, or main street, of Berne, extending about a mile in length, constitutes the chief part of the town—the remainder being an inferior back street, with a few short cross thoroughfares. All is densely packed, no space is lost; and to make the most of the room, the houses are extended over the foot pavements, forming long covered arcades, with pillars in front. These avenues are not elegant. The pillars are short and clumsy, and the shops on the inner side are dull and dingy; many, indeed, are never visited by a beam of the sun. The shopkeepers have less reason to regret this deficiency, from the universal practice among them of laying out their wares on a square bulk in front, which, with the pillars, almost closes up the opening to the street. On these bulks, you see all kinds of articles spread freely out, no one appearing in charge of them, and thus passengers walk through long alleys of goods as in a kind of bazaar. The lumpy projections I have, for want of a better name, called bulks, are the coverings to the stairs which descend by low-browed doors from the street, and lead to the subterranean regions of the buildings. The dwellings above, to the top of the buildings, are entered by common stairs adjoining the shops, each family occupying a distinct floor. No house has any spare ground behind, dense clusters of courts filling up the space as far as the next street. The only means of drawing a breath of fresh air is by the windows in front. Each of these opens, and a white or fancy-coloured cushion being placed on the sole, the inhabitants are able to seat themselves in an easy manner, holding, if necessary, by a cross railing, to prevent their falling over into the street. In fine weather, great numbers of well-dressed persons are observed lolling in these airy and somewhat perilous situations. I must not in this account omit to notice the street itself, which possesses a singular peculiarity in its construction. At certain intervals, in the middle of the causeway, there are fountains throwing out copious streams of water, which, on escaping, flows impetuously along the bottom of a paved channel prepared for it. This channel, which I can only compare to a grave, running up the middle of the street, is about eighteen inches deep, and evidently serves the useful purpose of a burn, at which half the scullery business of the town is, to all appearance, performed. How many accidents take place per annum from this hideous-looking gulf, I am unable to say. Another serious nuisance, in the streets of Berne, is the cutting of firewood, which you see in all quarters, stopping the way and keeping up a clatter of saws and axes. At the time of our visit, pipes were laying for gas.

Berne, though greatly modernised, and beautified by some handsome public buildings, still possesses a number of curious objects of antiquity. The public fountains are surmounted by figures of various kinds, but chiefly of men in armour, and bears; and so also is an ancient tower, the Zeitglockenthurm, which stands at the middle of the main street, like Temple Bar, London, with large and smaller passages beneath. This tall block of masonry, which dates from the year 1191, and had been a portal in the walls before the extension of the town, is ornamented on the eastern side by the dial of a clock, whose functions are performed in a very remarkable way. A minute before the striking of the hour, you hear a strange whirring sound, and observe a bustle among a variety of puppets adjoining the dial—a cock crows and flaps its wings, a king waves his sceptre, and a troop of bears march round in procession. The clock having struck, a similar crowing, flapping, waving, and marching take place, and the apparatus is stationary for another hour. The frequent appearance of the bear as a civic emblem is derived from a legendary story connected with the history of the town; and further to testify their affection for this amiable quadruped, the Bernese authorities have, from time immemorial, kept one or two specimens alive. The incumbents for the time being, we went, as a matter of course, to see during our perambulations. At a short way beyond the western gateway of the town, adjoining a very delightful public promenade, we found a well-constructed bear-pit, in which three of the fattest and laziest bears I had ever seen, were stretching themselves at their ease in the bright summer sun. They were fine examples of a sinecure life, though, if what Murray says be true, they are not now so well provided for as formerly. "At the beginning of the last century, an old lady, dying without near relatives, bequeathed her fortune of 60,000 livres to them. The will was disputed by some distant connexion of the deceased; but the cause of the brutes was so ably pleaded by one of the most distinguished members of the bar of Berne, that the plaintiff was nonsuited. The bears, declared the rightful heirs, were taken under the guardianship of the supreme council, who, treating them as wards in chancery, or minors, administered their property. In order to maintain the succession to the estate, a pair of young bears was always reared, in case of the demise of the elders; and to prevent too large an increase of the race, all that were born beyond this were fattened to furnish a dainty for the civic feasts of the Berne burgomasters. The bears, however, did not long enjoy their fortune. The French Revolution broke out, and its sweeping consequences, not confined to crowns and kingdoms,

* The Swiss, as I have repeatedly mentioned, are a hard-working and very plain set of people, individually possessing resources much inferior to those of regularly employed artisans in Scotland; but they enjoy greater comforts in consequence of their sobriety, and the thrift and industry of their families. After witnessing the temperate mode of living of the Swiss, I feel quite ashamed of my own country. A single fact will illustrate the contrast. Throughout the grand rue of Berne, a mile in length, and densely populated, I did not see a single tavern or spirit shop; I observed, certainly, that several of the cellars were used for the sale of wines (chiefly wholesale), but in none did I notice more than two or three persons seated. In the High Street of Edinburgh, from the Castle to Holyrood House, the same in length as the main street of Berne, and not unlike it in appearance, there are 150 taverns, shops, or places of one kind or another in which spirituous liquors are sold; and in Rose Street, a much less populous thoroughfare, the number is 41.

descended even to bears. The French army having defeated the Swiss in several engagements, entered the town (1798), and immediately took possession of the treasury. Eleven mules were dispatched to Paris laden with specie found in it; two of them bore away the birthright of the bears, amounting at the time to about two millions of francs. The bears themselves were led away captives, and deposited in the Jardin des Plantes, where one of them, the celebrated Martin, soon became the favourite of the French metropolis. When, after a series of years, the ancient order of things was restored at Berne, one of the first cares of the citizens was to replace and provide for their ancient pensioners. A subscription was raised in consequence, and a small estate purchased, the rents of which, though diminished from various causes, are appropriated to their support. The cost of keeping them amounts to between 600 and 700 francs per annum; and well-grounded fears are entertained, that modern legislators, forgetful of the service rendered by Bruin for so many centuries, in figuring upon the shield of the canton, may soon strike him off the pension list."

The carrying away of so much treasure from Berne is quite true, and the circumstance throws a strange light on the condition of society. It appears that until a comparatively late period, the Swiss knew so little of the fructifying power of money lent out at interest, or they were so fearful of losing the principal, that the practice was universal of storing up hard coin in chests. Every franc which could be saved was laid past in a strong box. These chests of coin, wherever found in the possession of public authorities, became the plunder of the French republican army, who, it is said, carried away as much as 120 millions of francs from Switzerland—a windfall which enabled the French government to pay for the equipments of their Egyptian fleet. One would have supposed that, on the restoration of the ancient constitutions in 1815, the people, taught by experience, would have employed their savings in some other way than hiding them in chests: but such was not the case; the practice continued; and when Berne underwent a revolution in 1830, the democratic party, on attaining power, found twelve or thirteen millions of francs reposing in idleness in the town chest. This sum, however, was not plundered, but devoted to the reasonable purpose of improving the town, the schools, the roads, and other public institutions.* The spirit of saving, I am told, is a predominating feature in Bernese society. It is not uncommon for several families to own a common fund, which is sacred from ordinary demands, and may only be drawn upon on the occasion of great misfortunes, or when a marriage dowry is required. All marriages are matters of family negotiation, with very little regard to the feelings of the parties concerned; and if any one rebel, he or she need look for nothing from the family chest. Latterly, these family funds have been more frequently laid out on property yielding an annual increase than was the case formerly—a circumstance no doubt attributable to the repeated seizures of the public cash.

In these and some other traits of character in the Bernese, we have a small insight into the state and tone of their society. They are a pains-taking race, fearful of losing advantages which they may have gained by years of industry and good fortune, and little influenced by modern notions of any kind. I could not help on some occasions finding a resemblance betwixt them and the Dutch—a constant eye to the main chance, not given to speculation, jealous of foreign connexion, encouragers of school instruction on a liberal footing, yet narrow in disposition, and fond of going on in their own quiet way. Like the Dutch, also, they are great supporters of hospitals for orphans, the poor, and other purposes. One of the principal beneficiary institutions in Berne is the Grand Hospital, a large building in the environs devoted to the reception of decayed burgesses, with the inscription over the doorway—"*Christo in pauperibus*" (To Christ in the persons of the poor). Both in Berne and other cantons we find a trait of manners certainly not Dutch. This is a practice pursued by travelling workmen of begging their way, and which is common all over Germany. Young men of this stamp, with knapsacks on their backs, frequently pushed their hat into our carriage seeking for an alms, with very much of the usual mendicatory whine. I do not know that any thing more offensive than this occurs in German and Swiss travelling; and although sanctioned by immemorial usage, surely it must have a demoralising effect on the individuals who resort to it. I spoke of the practice to an intelligent Bernese, who assured me that it was against the regulations of crafts for workmen to beg; and that there were certain corporation establishments in every town to which it was their duty to apply for assistance. These establishments are called *abbeys* in Berne, and the houses belonging to them respectively may be known by external inscriptions and coats of arms.

Besides the numerous beneficiary institutions, public and corporate, the town is celebrated for its large and well-conducted prison, in which *labour* is employed most advantageously as an engine of moral regeneration, on a plan now followed in the best penitentiaries in this country. Of the University of Berne, the scientific societies, the public library and museum, it is unnecessary to speak. I should suspect that the town is not so literary as Zurich, though a third larger and less given up to manufactures. I saw only two booksellers' shops, but they did not seem to possess any native literature worth speaking of: their shelves were filled with the yellow-covered tomes of Paris, and the rough productions of Germany.

In or about Berne there is not much to interest strangers; but the views around are very beautiful. The clear green Aar winding round the foot of the hill on which the town stands—the gardens rising like terraces one after another from the river to the tall houses above—the rich green country beyond—and the distant peaks of the snow-clad Alps—all combine to form a splendid panoramic picture. Desirous of seeing a little more of the country parts of the canton than had yet come under our notice, and also to make some personal inquiries respecting the method of education pursued by M. Fellenberg at Hofwyl, I spent a day in an excursion from the town, which will form the subject of my next paper.

* I have lately perused an excellent sketch of the political revolutions of Switzerland between the years 1830 and 1832, in the *British and Foreign Review*, No. 25, to which I would refer those who are interested in the subject. Of these revolutions scarcely any thing is known in England, although they afford instructive lessons in national government. The general principle aimed at was the abolition of those corporate and family privileges which had weighed down the country since their restoration in 1815, and making the cantonal governments in each case a reflex of the will of the whole people. This double object was effectually gained in Berne, Vaud, Zurich, and seven other cantons; and although not unattended by wranglings, political and ecclesiastical, the changes have given universal satisfaction. Since the people of Berne became in effect their own governors, they have, like those of Zurich, Vaud, &c., done much to promote education on the broadest possible scale—public enlightenment, as they conceive, being the only sure basis of public liberty. During my visit to the country, there was a considerable ferment respecting the suppression of certain convents in Argau; but any notice of this subject would be inconsistent with the character of these pages.

VULGAR HALLUCINATIONS.

COUNT CAGLIOSTRO.

If any one chance to be unacquainted with the general character of this personage, he may learn something of it from the following pithy summary of his titles given by Thomas Carlyle. "Count Alessandro Cagliostro, pupil of the sage Althotas, foster-child of the Scherif of Mecca, probable son of the last king of Trebizond; named also Acharat, and unfortunate child of Nature; by profession healer of diseases, abolisher of wrinkles, Grand-Master of the Egyptian Mason-Lodge of high Science, spirit-summoner, gold-cook, Grand Coptha, prophet, priest, and thaumaturgic moralist and swindler; really a liar of the first magnitude, thorough-paced in all the provinces of lying, what one may call the *king of liars*." The man who so comported himself in life as to merit these titles, and not one of them is inappropriately or unjustly applied, must have in his time played many parts, from the contemplation of which may result both entertainment and instruction.

In the year 1743 Joseph Balsamo first saw the light, being born of poor parentage resident at Palermo in Sicily. Left under the weak control of a widowed mother, the youth showed an unruly and indolent disposition in his earliest years, and greatly neglected even the scanty educational advantages which were afforded to him. In his fifteenth year a circumstance occurred, which, in part, gave the tone to his whole future existence. An uncle got him placed in the convent of Cartegirone, where the house apothecary was charged with the task of instructing him in the arts of chemistry and pharmacy. Idle as he continued to be, he no doubt acquired here some little knowledge of these sciences, and we shall see what use he finally made of it. After some years' stay, he grossly insulted the monks of the convent, was consequently punished, and quitted the place for ever, leaving those behind to congratulate themselves on the happy riddance. Joseph Balsamo, now nearly in his majority, passed the few succeeding years of his life in Palermo, acquiring by degrees the repute of being one of the most finished blackguards in the place, and fully deserving it by robbing his uncle, forging a will, and many similar acts. At length, he used his address to persuade a certain foolish goldsmith that a large treasure, to be obtained by digging, lay hidden in a cave nigh the city, and, on their going at midnight to the spot, Balsamo brought out on the dupe a band of accomplices dressed like fiends, who robbed the poor man, and beat him cruelly. Having his eyes fully opened, the goldsmith threatened to retort with the Sicilian vengeance of the stiletto, and Joseph thought it necessary to take himself off from his native Palermo.

With the lion's share of the booty, sixty ounces of gold, Balsamo proceeded to Messina, where he met an alchymist named Althotas, a man versed in various mysterious secrets of nature, and an adept in the eastern tongues. The career of our hero in connexion with Althotas is buried in doubt and obscurity, his own statements in after days being any thing but trustworthy, or even consistent. The common statement is, that, finding Althotas to be possessed of a secret for making goods out of flax of an almost silken quality, Balsamo persuaded him to try a commercial venture to Alexandria, with a store of that commodity. The voyage was eminently successful. It is probable that they visited Egypt and Turkey after this time, selling drugs and amulets. From the stories afterwards told by our hero, when, concealing his real origin, he let out ambiguous hints of his being some unfortunate oriental prince, it is possible that he also visited Mecca and Medina. A visit to Malta is better substantiated. He was well received by the grand-master, and, with his companion, laboured there for some months at the task of making pewter into gold. It is also said that Althotas died in Malta. Be these things as they may, certain it is, that, during the mysterious years of his life now under notice, the Palermitan was fitting himself most diligently and successfully for his final career; and that, at the close of his probation, he appeared alone in Rome to commence a new era of his history.

It must not be thought that Balsamo had been all this time contented with his ill-savoured, untitled patronymic. He had been a chevalier, a marquis, and six or seven different barons in succession, just as it suited him. Count Alessandro Cagliostro was the title which he bore on entering Rome, and it became his permanent one. He at first contrived to live by selling pen-drawings (forged ones, moreover, being merely engravings Indian-inked); but this was a poor occupation, and he speedily gave larger scope to his genius. He commenced the sale of an *elixir* for warding off old age and disease, and further boasted that he could *transmute metals* and make himself *invisible*. The Maltese grand-master had given him good letters of introduction. These admitted him to society, where his boundless boasting and indomitable assurance impressed some with a conviction of his mystic powers. The elixir sold abundantly, and his success tempted a beautiful Roman, Lorenza Feliciani, to share his rising fortunes. Unscrupulous, witty, and fascinating, Lorenza was an admirable partner for Cagliostro, who speedily made her an adept in all his pretended mysteries. The worthy pair now sought a wider sphere for their combined attacks on the European purse. They opened their career worthily by going to Westphalia on a visit to the Count St Germain, the great quack of the preceding generation, whose character is settled by one fact; he called himself two thousand years old. Cagliostro, no doubt, inhaled much goodly knowledge from this personage; and, for the next three years, Venice, Madrid, Cadiz, Lisbon, Brussels, and, in fact, great part of Europe, enjoyed the advantage thereof. Travelling usually in a four-horse carriage, with the lovely countess by his side, and a host of couriers and beef-eaters before and behind, all in Parisian liveries, the great count enters in succession the cities of the continent, recommended to the high-birthed dupes of one place by those whom he had left in another to awaken at leisure from their dream of eternal youth. Arrived, he fixes himself in some splendid hotel, and shows a full and open purse. Man and wife soon address themselves to business. For ladies, he had lotions beyond all that the imagination could conceive; and for faded gentlemen of quality, he had a Wine of Egypt, and other potions, washes, and charms innumerable. It may be thought that princes and nobles would be apt to deem it degrading in a count to sell things for money, like a common quack-salver. No such thing. The count, generous man, never gets his own money for them. He travels the world to do good; and how readily would he give the precious drugs for nothing, were it not they are brought from far at a great expense! Much of this he himself really defrays, but to reimburse him to a small degree he is forced to take—a consideration. The poor he visits gratis. Thus run the tale and practice of the arch-quack.

Cagliostro and his countess were not always pampered, however, in fortune's coach-and-four. Sometimes their stores ran low; and on unwisely attempting to figure in the eyes of old friends at Palermo, the count was sent to jail by the revengeful goldsmith. He had the address to induce a Sicilian prince to interfere, and he was freed. Then, again, we hear of Cagliostro in London, in the obscur character of a common painter, and bearing the title of plain Signor Balsamo. This was in 1772. He returned to the continent, and must again have climbed the ladder of fortune; for we find him once more in England, in 1776, with a stock of £3000. The count here commenced as usual with his elixir and philosopher's-stone annunciations; but it was necessary to the success, both of himself and his helpmate, that they should obtain access to society. A false friend undertook this task, and introduced them to mock lords and ladies, by whom, ere long, the arch-plunderer was plundered of all his means. A prison was the end. The count gained his freedom, however, and left the uncongenial air of England. Yet the visit was not thrown away. Far from it. He had been initiated into some obscure mason-lodge, and the most brilliant idea of his life struck him in consequence—the idea of the "Grand Egyptian Lodge of Masonry," of which who so fit as himself to become

the head, or, as he called himself, the Grand Coptha? As for the female lodges, again, who so well suited for the "Grand Priestess-ship" as the fair Lorenza?

Full of this new idea, the count recommenced his career on the continent. The repute of the wonderful Egyptian mason, who knew all the secrets of the brotherhood, from the time of its institution by "Enoch and Elias," soon flew abroad. "Arrived in any city, he has but by masonic grip to accredit himself with the venerable of the place; and, not by degrees as formerly, but in one night, is introduced to all that is fattest and foolishest far and near; and in the fittest arena—a gilt pasteboard masonic hall." Mr Carlyle, to whom we are indebted for part of our information, describes the quack as having been received with loud shouts under steel arches; as holding three-hour discourses on all things fittingly unintelligible; and as founding Egyptian lodges in all manner of places, with ceremonials of such a dark, death's-head description, that it makes one's hair stand on end merely to read of them. The elixirs sold now at a double quick rate; and in consideration of the enormous expenses of the Grand Coptha, in correspondences and the like, the money flowed into his coffers in full streams.

Passing in splendour from place to place, the count visited Warsaw, and finally Strasburg. Here he met the greatest of his prizes—the Prince de Rohan, first-class peer of France, and Cardinal Archbishop of Strasburg, rich as Crœsus, and gullible to excess. Knowing well his man, the count at first wrapt himself up in reserve, while he at the same time gained a character by liberally dispensing medicine (brick-dust pills, possibly) to the poor, and even showing them, now and then, his purse. Prince de Rohan sought an interview again and again; he was refused. His anxiety grew greater, and at length he was indulged. At once he became an obedient dupe, and his purse was emptied freely—in payment, chiefly, for the profound predictions which Cagliostro gave the cardinal, to serve in guiding him in all his affairs.

This period, 1783, may be called the brightest in the career of Cagliostro, whose reputation was now European. He was asked by the Prince de Rohan to go to Paris, and went; but he staid at this time only a few days, being anxious to drain a little further the dupeables of Strasburg. But the enthusiasm was past, and he found it advisable to try Bordeaux. Here, for the period of a year, he was so eminently successful in magical and elixir practice, that the authorities at one time granted him a guard to keep his doors clear. Bordeaux exhausted, he thought fit to quarter himself on Paris. It might have been expected that he would have shrunk from exposing his magical pretensions to the eyes of the savans in Paris. Not he. He there openly professed his ability to transmute metals; and, by handicraft deceptions, he practically convinced the silly and unwary. He—when well paid for it, for the dead would not rise for nothing—called up *spirits*, though they seem not to have been seen, but merely to have spoken to him from under glass bells. The countess supported him ably in these deceptions.

But Cagliostro suddenly fell in this very zenith of his glory, and fell irrecoverably. Happening to be somehow involved in the celebrated necklace case of Marie Antoinette, where one of the queen's servants, named La Motte, forged her mistress's name, Cagliostro, as well as La Motte and Rohan, was thrown into the Bastile. On being brought to trial, he told lies of the most astounding magnitude as to his birth and resources, averring for one thing that he was constantly supplied with money by an unknown friend in Arabia; but the court paid no attention to his rant. La Motte and others were duly punished: as for our count, though he got free, it was in the state of a beggar.

The sun of the arch-quack had begun its descending course, and rapid, indeed, was its downward progress. In England, to which he now resorted, he gained the countenance of scarcely one man of note excepting poor Lord George Gordon; and trickery was at a discount now, whether in regard to elixirs or Egyptian lodges. Cagliostro was compelled to look to the Continent again; but, alas! France, Germany, Russia, and the Sardinian territory, were all closed against him by positive royal edicts. He had been too successful in his magic. His wide-spread repute had roused the long suspicious church, and he had lost all power to contend with her. So he felt to his cost, when, after some obscure and poverty-struck ramblings, he ventured at length to enter Rome in 1789, urged by his wife, who, jaded and wearied out, now desired but to reach her mother's grave and die. Cagliostro had not been long there, ere the Inquisition caught him founding what Mr Carlyle aptly calls "some feeble, moneyless ghost of an Egyptian lodge," and he was thrown into the Castle of St Angelo. By papers, and petitions, and explanations, and recantations, Cagliostro still struggled stoutly for life and liberty. The former boon he obtained; but being doomed to perpetual confinement, he died in St Angelo in the summer of 1795. The Grand Copthess was placed for life in a nunnery.

Cagliostro forms on the whole a sad monument of the miseries of a career of imposture. We have seen here what was the end of all; and moreover, with all his impudent assurance, it may be doubted if the instability of his position, and the constant risk of exposure, left him one happy moment even in the hours of his greatest success. Goethe visited his disclaimed mother and sister; and the picture given of their calm tranquillity of mind, in the midst of poverty and privations, but impresses us the more strongly with a sense of the folly of preferring a life of splendid vice to one of humble virtue.

AN INCIDENT IN THE REIGN OF ELIZABETH.

Let us in idea go back two centuries and a half, and step into the presence-chamber of Queen Elizabeth. The walls are hung with rich tapestry, while the floor is strewed with fresh hay. At the door leading to the queen's apartments stands an usher dressed in velvet, with a gold chain around his neck, the badge of his office. In the chamber may be seen, besides, a great number of councillors, officers of the crown, and clergymen of high rank—for the queen, after giving passing audience to those present, proceeds to chapel, the day being a holiday of the church.

The mid-doors are thrown open, and the coming of the queen is announced. Gentlemen, barons, earls, and knights of the garter, all richly dressed and bareheaded, are the first to enter the presence-chamber from her apartments. They are followed by the lord-chancellor, bearing the seals in a silk purse; and on each side of him walks a nobleman, one bearing the royal sceptre, and the other the sword of state in a crimson scabbard. Queen Elizabeth follows. A small golden crown is upon her head, and rests on a profusion of thick curled hair, of a colour too deeply sanguine to countenance her early flatterers when they called the hue golden. The locks now worn by Elizabeth are, however, but a close imitation of what her natural tresses were in her younger days. Rich pearls hang from her ears, and a necklace of fine jewels is thrown over her shoulders. A white silk robe, bordered with large pearls, adorns her person, and the long train is borne by a marchioness of the realm. Elizabeth is now, as has been hinted, past the meridian of her days, yet is her gait erect and majestic, and her small dark eye retains its clear and vivid expression. A sharpening of the lines of her naturally acute lineaments is all that speaks of the advance of years.

On the occasion when this scene, here described in the present tense, was to be witnessed, foreign ministers were in the presence-chamber, and to each Elizabeth spoke in his own language, whether that were Spanish or Italian, French or Dutch. Whithersoever she turned her eye, all knelt down before her. Whosoever had the honour of a word from her, remained kneeling, unless the great queen raised him. She passed along slowly through the large chamber, conversing to those on one side and another, and sometimes receiving strangers presented by the usher. She came at length to a gentleman advanced in years, who knelt at her look. He was richly dressed, but not in the robes of office or nobility. "Ha!" said the queen, stretching out her hand, and raising this personage; "our good citizen, Sir John Spencer. Welcome! Thou wert informed of our wish to converse with thee?" "I had the honour," answered the citizen, "to receive your majesty's commands to that effect." "Thou hast ever indeed, good Sir John, regarded our slightest wish as a command," continued Elizabeth; "and well thy loyalty beseems thee. Thou hast paid dearly, too, for thy affectionate regard to our person." The old citizen sighed as if involuntarily, showing well that he understood the queen's allusion. She went on, however, to refer more plainly to the subject, while all around fell respectfully back, marking her low tones. "It was while an attendant on our train that my young Lord Compton first saw thy daughter, and the issue was the rash marriage which thou deplorest. Sir John, we would remedy the evil thou hast sustained." The face of the citizen-knight grew suddenly flushed, and then left him more pale than before. He knelt down after a moment of apparently agitated thought, and said, in a low and hurried voice, "I hope—I trust your majesty does not mean to lay your commands on me to pardon"—— The queen interrupted him. "Listen to us, Sir John Spencer. Your paternal resentment will be respected by us. It is a *favour* which we have now to require of thee, and the granting of which may partly remedy the misfortune which you have suffered. An infant boy has somewhat strangely fallen to our particular guardianship. He is of such rank and birth that we conceive thee to be a fitter person to act as his sponsor than any of the nobles of our court. Thy civic position suits thee much more for serving the future fortunes of this boy; and, God's bread, Sir John, thou shalt have a queen for a partner in the office."

Doubt had gradually disappeared from the citizen's brow during this speech, and had been supplanted by a feeling of the highest gratification, as was clear and apparent in his looks. "Your majesty," said he, "does me an honour which kings might be proud of. And by my life, madam, I shall prove, by my conduct to the boy, that your majesty has not so honoured one who is ungrateful for it. I have no child," continued the citizen, more slowly—"I have no child now, and my godson shall supply the place which has been wilfully vacated." The queen was obviously pleased with what had passed. As she looked on Sir John, who had cast down his eyes in closing his speech, there was a sparkle of passing pleasure in her quick dark eye. "Farewell for the present, Sir John Spencer," said she; "due tidings shall reach thee when it becomes necessary to assume thy new duties." The knight stooped to kiss the hand extended to him, and the queen passed on, leaving the citizen to follow, and finally wend his way homewards.

Sir John Spencer, commonly called "Rich Spencer," was in his day the wealthiest and most influential citizen of London. The mayoralty and shrievalty had been both served by him more than once, we believe. He was a great favourite with the queen, being noted for his public-spiritedness, and his anxiety to sustain the honour of his sovereign and his country. Such a feeling was peculiarly evinced by the opulent cloth-worker, as he was by profession, on the occasion of the Marquis of Rosny's visit to England, as ambassador from Henry IV. of France to Elizabeth. The Marquis (afterwards Duke of Sully) was lodged and entertained by Sir John in the most sumptuous manner, at his own private cost. He was understood to be worth a million sterling, and had but one child, a daughter, his sole heiress. Having fixed upon a son-in-law in his own rank in life, the worthy citizen had been deeply irritated by the elopement of his daughter with the young Lord Compton; and though, at the period referred to in our story, more than a year had elapsed since the event, Sir John's anger seemed to have been increased rather than diminished by the lapse of time. Various attempts had been made to bring about a reconciliation, but unsuccessfully. So stood the family affairs of Sir John Spencer, when good Queen Bess intimated her wish to honour him in the manner related.

Of that honour the citizen continued to think with pride, up to the time of his receiving a message from the queen, requiring a second visit from him at Greenwich Palace. Thither, accordingly, Sir John wended his way, meditating how he might best show, in a marked manner, his sense of the high favour bestowed on him by the queen. When ushered into the presence of the latter, he found her with a goodly company of ladies and courtiers; and in presence, also, was her majesty's household chaplain. "Welcome, Sir John," said the queen, as the citizen paid his duty on entrance; "thou art punctual, yet we have been for some time in readiness. The ceremony shall be private, as best befits the condition of our poor little charge." Sir John bowed in silence; and the company, at a motion of the queen's hand, proceeded to the small chapel, where her majesty was accustomed to perform her private devotions.

We shall suppose the child baptised, and the whole ceremony over. Increasing the amount of the honour, the queen gave to the child the Christian name of "Spencer." This unexpected circumstance, and the uncommon beauty of the infant, seemed to determine the knight in its favour. "Madam," said he to the queen, with tears in his eyes, "I have resolved to show my sense of this honour by adopting this child, now my name-son. He shall be my *sole heir*; and, that no foolish relentings may afterwards affect this resolve, I here solemnly vow, before the holy altar, and in presence of your majesty and this fair company, to settle irrevocably my estate by deed in this child's favour, and to place it immediately in your majesty's possession, if you will honour me by accepting such trust."

The eyes of the queen sparkled with unaffected pleasure. "'Tis well, Sir John Spencer," said she; "we are witnesses to your promise, and know that it will be kept." She then turned round, and exclaimed, looking to a side door, "Without there! You may enter." In an instant the door was thrown open, and Sir John Spencer beheld his daughter, the Lady Compton, and her husband, kneeling at his feet. Before the agitated citizen could speak, the queen addressed him. "Sir John, the child whom thou hast here adopted is thine own grandchild. Take these his parents also to your favour, and make this one of the happiest hours in a queen's life." "Pardon, dearest father, pardon!" cried the weeping daughter of the knight; "pardon," continued she, taking her child from an attendant, and raising it in her arms—"pardon, for this child's sake!" Sir John Spencer could not resist these appeals. "Heaven bless you, my children!" said he, embracing them by turns; "I do forgive all the past; and I heartily thank her majesty, who has brought about this happy event."

Our anecdote is told. Many glorious acts signalise the reign of Elizabeth, but it may be questioned if any recorded deed of hers places her character in a more pleasing light, than the little ruse by which she reconciled Sir John Spencer and his daughter.

A CHINESE PAINTER.

A Chinese who was present at the martyrdom of a Christian missionary, was so struck with the firmness with which he died for his faith, that he himself became a Christian. He made his way to Europe, went to Rome, and studied painting: he has been successful as an artist; and there is now here, in the church of St Guillaume, a fine picture by his hand, well designed and strongly coloured. The subject is "The Death of the Christian Missionary," to which he was a witness, and which changed his faith and his life.—*Art Union.*

CURATIVE TREATMENT OF THE INSANE.

THE following are passages extracted from the last report of the Crichton Asylum for Lunatics near Dumfries—an institution on a splendid scale, founded by a large bequest, and conducted by Dr W. A. F. Browne, author of a work on Insanity:—

"It is difficult to convey any adequate notion of the series of operations of which moral treatment consists, to describe the agents which have been, or may be, made to act directly upon the mind itself, because it is impossible to mark exactly where physical treatment terminates, as the efficacy of even a drug may, and often does, depend as much upon the feelings of repugnance or confidence with which it is swallowed as upon its intrinsic properties. Indeed, every step beyond the regulation of the diet and the exhibition of medicine to regulate and restore particular functions—there being no specific for derangement—leads to an attempt to reach the disease through and by the senses, the intellect, or the affections. The residence of an individual in an asylum, the new arrangements, the absence of friends, the subjection to discipline, and the delivery of every thought and wish into the keeping of strangers, are all intended and calculated to address the mind itself, and to serve as silent arguments and warnings against error—to create a disposition to self-examination and self-regulation, and to force the adoption or imitation of rational views and habits. That these instruments often act in this way is unquestionable; and because they cannot be assembled or applied at home, it is well shown that efficient treatment can only be found in an asylum. The occupations, recreations, the rigid routine, the varied exercises, the stern or soothing tones of the physician's voice, all operate on the same principle; and when judiciously selected and perseveringly applied, remodel the whole nature, and sometimes restore health. But besides these means, there are many, such as the following, which are suggested by the peculiar circumstances of each case, founded upon some former taste or capability, or adapted to the actual condition of the patient, or the change which it is desirable to bring about:—

Our amanuenses, greatly increased in number, have been as industrious as if engaged in productive labour. At one time it was ground for envy and emulation which should be selected to assist the medical officer; many thousand pages have been copied or written to dictation, and in one case with a marked humanising and elevating effect. One young lady is at present curing herself of extravagant ideas of her own greatness by copying, and then playing music, at which she is an adept. And that the curative powers of the sister art of painting might not be untried, we have an instance where a convalescent house-painter aspired to portrait-painting, and executed a likeness of the matron. The effort was certainly a failure, but it confirmed and consolidated the recovery of the artist. One amiable, and accomplished, and excellent being, who imagined that it was incumbent upon him to abstain from food to increase the comforts of the poor, and to prevent a general famine, and that his brain was transmuted into fat, and consequently impeded the exercise of his faculties, was induced to engage in the study and translation of Molière's *Malade Imaginaire*. He spent many delightful hours at this task, bending his powers diligently to overcome the difficulties, and to discover the beauties, of the author—coming out of himself, as it seemed, forgetting his own sorrows and ailments, and, it may be, tempted to doubt their reality, while laughing at the hypochondriacal fancies and medicine mania of Argan. He subsequently undertook the translation of the life of St Vincent de Paul, and glowed and gladdened with the benevolence which pervaded his every sentiment in transcribing the eulogiums upon that Howard of the sixteenth century, the friend and father of the poor lunatic. In one case, where it was important to impart new springs of conduct, to alter the character and the profession, and yet to recommend what coincided with the previous tastes and training of the individual, the study of medicine was engaged in; and the patient read assiduously, acquired a very considerable knowledge of the sciences of anatomy and physiology, and imbibed a strong ambition to prosecute his studies further. A well-educated gentleman, who conceives that he is undergoing a temporary penance for an offence against a high ecclesiastical dignitary, and who would willingly spend his days over a Greek or Hebrew work, was bribed to relinquish these severer studies for the acquisition of the French language, which, with a very few hints as to pronunciation, he accomplished, and would have grappled with German had the necessary books been accessible. A schoolmaster, who is too proud of his caste to engage in manual labour, cheerfully attempted the tuition of his fellow-patients. A clergyman of most morose and melancholy disposition, so far forgets his dejection and selfishness for an hour each Sunday, that he reads, reverently and correctly, the prayers of the Church of England to such of the patients and officers as belong to that communion. When it is added that the clerk who reads the responses is likewise insane, it may be imagined that the scene is fraught with interest and emotion, and only surpassed by those which occurred in the primitive ages of the Church, when the energumens crept to the altar and were healed. Recovery cannot, in this instance, be directly traced to the act of devotion or the feelings excited; but there are reasons for supposing that these feelings are of a sedative and salutary kind; and they certainly possess this striking characteristic, that for the time they predominate over every other; and there may be observed the wandering reason, the turbulent passions, the deluded imaginations of priest and worshippers, however widely separated in all others, meeting and uniting in this one point—the solemnity of the act in which they are engaged.

It was determined to produce a powerful, painful, and retrospective train of feeling in a person who seemed to be lapsing from a state of high over-wrought sensibility into one of apathy and senility. He had distinguished himself as a poet; and, during one of his darkest and dullest moods, some of his own beautiful and pathetic verses were read to him. He at first smiled, then appeared to be awakened to a recollection of the circumstances and emotions under which they had been composed, then became deeply affected, and wept. He was agitated for some hours, but the effects gradually disappeared.

To engage the minor affections, and, in the absence of higher objects, to call forth that love for animals which has characterised men of refined and serene temperament, has been considered curative, and tried. Accordingly, sheep have been introduced into one court; in another, rabbits have long ingratiated themselves with the patients; in a third, urchins have become favourites; in a fourth, there is a colony of white mice; and in the fields, a jackass was courted and conciliated by a convalescent.

The great objection to all these measures is, that they embrace only one patient, or a very small number of patients; that the application of them is therefore difficult and tedious; and that success must depend as much upon the skill and tact of the experimenter as upon the consent of the individual to be acted upon. What is wanted is, some plan which shall rouse, arrest, and tend to regulate the intellect of a number of patients simultaneously, without rousing or disturbing the passions; and as insanity, in a majority of cases, consists rather in excited feeling than in disordered reason, this precaution is absolutely necessary. It is not pretended that this panacea has been discovered; but a practice has been recently commenced which possesses many of the advantages coveted, is at all events perfectly innocuous, and promises to afford a very simple, cheap, and pleasing antidote to the darkness and dullness of a winter's evening.

Tranquil and convalescent patients have been allowed to attend quiet parties for conversation and music; to visit the Theatre, the Circus, the Exhibition, the Bazaar, the races, and public concerts; and the liberty thus granted has in no case been abused, nor—so complete has been the control exercised—have the insane been distinguished from those by whom they were accompanied. Now, when familiarised with the beneficent influence of a sounder philosophy, and instructed that many of the insane are only partially separated from the sane, such facts do not excite surprise or interest. But if it be recollected that, at a period by no means distant, no patient ever passed beyond his cell or airing-yard, and that the very individuals now described as mingling in the pleasures of their fellow-men would have been condemned to perpetual confinement and to chains, the boldness and triumphs of the humane system will be appreciated."

ON THE LAUNCH OF A FIRST-RATE.

[From "The Pilgrim of Glencoe, and other Poems," by Thomas Campbell, just published.]

England hails thee with emotion,
Mightiest child of naval art,
Heaven resounds thy welcome; Ocean
Takes thee, smiling, to his heart.

Giant oaks of bold expansion
O'er seven hundred acres fell,
All to build thy noble mansion,
Where our hearts of oak shall dwell.

'Midst those trees the wild deer bounded
Ages long ere we were born,
And our great-grandfathers sounded
Many a jovial hunting-horn.

Oaks that living did inherit
Grandeur from our earth and sky,
Still robust, the native spirit
In your timbers shall not die.

Ship, to shine in martial story,
Thou shalt cleave the ocean's path,
Freighted with Britannia's glory,
And the thunders of her wrath.

Foes shall crowd their sails and fly thee,
Threat'ning havoc to their deck,
When afar they first descry thee,
Like the coming whirlwind's speck.

Gallant bark! thy pomp and beauty
Storm or battle ne'er shall blast,
Whilst our tars, in pride and duty,
Nail thy colours to the mast.

AMERICAN AGRICULTURISTS.

AN Agricultural Society for the state of New York has been instituted lately. The first meeting and cattle-show was held at Syracuse, in September. At the dinner, to which 1200 persons sat down, the Hon. Micah Sterling, in the course of a lengthened address, reported in the *Albany Cultivator*, made the following remarks:—

"It is truth too, beyond all doubt, and as gratifying as it is true, that the number of wealthy and independent farmers has greatly increased within the last quarter of a century. I can only speak more particularly of my own county, where it is a blessed sight to travel among the farmers, and see how in a short time things have changed their appearances for the better—how the log-cabin has yielded to the beautiful stone, or brick, or wooden mansion, the barn of poles to the stately edifice of boards and timber, the front yard of dirt and filth to the neat lane and shrubbery; and how the whole country has assumed, or is rapidly assuming, that appearance of neatness, beauty, high cultivation, and comfort, to which all American farmers, with honesty, industry, and economy, can soon attain. I dare say other parts of the state are equally changed for the better, and equally sustain the great cause of cultivation and improvement. Add to all this, many men of wealth, and taste, and science, have devoted their time, and a portion of their wealth, within a few years past, to the importation and rearing of the first order of stock; and, while it is hoped they are increasing their ample fortunes, they are becoming the true benefactors of the country, and take an active and prominent part in sustaining the cause of home industry and agriculture. If husbandry is made respectable, as it ought to be, it will serve to check one of the greatest evils that bears now heavily on the community—the rush of our young men into the learned professions, which are already filled to overflowing, especially that of the law, which, under the present wretched course of legislation, of making litigation cheap, is starving this once honourable and most useful profession. Yet it is thought to be the high road to office and honour, and ambitious fathers and weak mothers are for making their sons great lawyers and eminent judges. Infatuated policy! The greater part of them never rise higher than respectable pettifoggers. Many of them get disheartened, and sink into dissipation and idleness. * * * *
The business of the farmer knows no such anxiety—is accompanied by no such risks; it is quiet and peaceful. Make it intelligent, and you open to it the first and highest honours of your country: there are no prejudices against it, as against that of the law; there is no limit to it; it is broad and extensive enough for all—a rich and wide domain, the vast possessions of the government, lie open to us—it invites to cultivation and improvement. If our rich men will plant themselves in the country, and educate their sons in the care and knowledge of the farm, they would see the land smiling around them, their children would be honoured in their industry, the occupation of the plough be elevated and respected, their sons prove healthy, robust, and strong men, and they and their descendants become, as the landholders are in England, the great men and strong props of the government. Hard and incessant toil is not essential in any farmer, nor any toil equal to the exhausting unhonoured labours of the lawyer and mechanic: a few hours a-day devoted to the regulation and superintendence of the farm, affording a most wholesome and agreeable exercise to the body, is all that is requisite to the independent farmer; reading, writing, &c., will pleasantly and profitably occupy the rest of the day. To my brother lawyers, in particular, would I recommend this kind of life as the happiest and the best. They are capable of making good farmers, and, when advanced in life, they are fit for nothing else; the strife and rivalship of the law are neither suited to their temper nor taste. They are often, if not generally, first and foremost in every good work. Let us set the example in this. I regret not meeting more of them on this occasion. It is said to be dull times for them—three hundred are said to have cleared out from the city of New York. I hoped to have met some of them here; the country and the plough will receive them with open arms, and give them plenty of honest business. There is room enough for them all. I offer my own experience as a slight and humble instance of what may be easily effected: I have had the pleasure of superintending a farm—I have succeeded to my entire satisfaction—my farm is growing up under my own eye, yearly developing new beauties and new sources of income and improvement; and if it does not make me a richer, it makes me a healthier, and, I trust, a better man. In fact, dyspepsia and the blue devils immediately left me. I am conscious that the occupation is an honest one; I know it is a healthy and pleasant one; and as it interferes with no man, it is a peaceful one, and all nature tells me it is one that God will bless and prosper."

CHAMBERS'S EDUCATIONAL COURSE.

THIS Series of Publications, which has for some years engaged the attention of MESSRS CHAMBERS, and been issued with as much speed as the nature of such an undertaking would permit, now approaches its completion. Within the last few days, there has been added to the list of works issued—"ENGLISH GRAMMAR AND COMPOSITION, PART FIRST" (designed to be completed in Two Parts), by Mr D'ORSEY, Head Master of the English Department in the High School of Glasgow. ZOOLOGY and PRACTICAL MATHEMATICS are in the press, and will speedily appear.

The following is the List of Works issued, with their Prices, all strongly bound in coloured cloth:—

Infant Treatment Under Two Years of Age,	1s. 3d.
Infant Education From Two to Six Years of Age,	2s. 0d.
First Book of Reading,	0s. 1½d.
Second Book of Reading,	0s. 3d.
Simple Lessons in Reading,	0s. 10d.
Rudiments of Knowledge,	0s. 10d.
Introduction to the Sciences,	1s. 0d.
The Moral Class-Book,	1s. 6d.
A Geographical Primer,	0s. 8d.
Text-Book of Geography for England,	0s. 10d.
Introduction to English Composition,	0s. 6d.
First Book of Drawing,	1s. 6d.
Second Book of Drawing,	1s. 6d.
Animal Physiology,	1s. 9d.
Rudiments of Chemistry, by Dr D. B. Reid—a new and greatly improved edition,	2s. 3d.
Natural Philosophy, First Book,	0s. 10d.
Natural Philosophy, Second Book,	0s. 10d.
Natural Philosophy, Third Book,	0s. 10d.
Elements of Algebra, Two Parts, each	2s. 6d.
Elements of Plane Geometry,	2s. 6d.
Solid and Spherical Geometry,	2s. 6d.
History and Present State of the British Empire,	2s. 6d.
History of the English Language and Literature,	2s. 6d.
Principles of Elocution, by W. Graham,	3s. 0d.
History of Greece,	3s. 0d.
Exemplary and Instructive Biography,	2s. 9d.

To the foregoing is added a Series of SCHOOL-ROOM MAPS of a very large size—Maps of England, Ireland, Scotland, Europe, Asia, Palestine, North America, South America, Africa, and the Hemispheres, designed by JAMES FAIRBAIRN, Esq., Rector of Bathgate Academy. Each Map measures 5 feet 8 inches in length by 4 feet 10 inches in breadth. Price, coloured on cloth, with rollers, 14s. each; the Hemispheres (including Astronomical Diagrams), 21s.

Published by W. and R. CHAMBERS, 339 High Street, Edinburgh. *Agents*—W. S. ORR and Co., Amen Corner, London; and W. CURRY Jun. and Co., Dublin; and sold by all Booksellers. In cases where Teachers find a difficulty in getting supplies from Booksellers, they may apply direct to MESSRS CHAMBERS or their chief Agents, as above.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 534. SATURDAY, APRIL 23, 1842. PRICE 1½*d*.

WHAT IS MEANT BY "A BEGGAR?"

IT is to the house of death we will ask the reader to accompany us; but he need not fear for his sensibility, if he is over much possessed of it, for we are not going to picture any scenes of overwhelming grief. It is true that the shutters are closed, and the servant who ushers you in looks grave, and speaks in a lower tone of voice than usual; and Mr Compton, the master of the house, heaves a sigh as he addresses you, while his lady-wife raises her handkerchief to her eyes. It is a second cousin of the former who is dead—a solitary old man, who, after passing nearly forty years in a foreign land, returned home to spend the independence he had acquired, and to find of his early friends some dead, others separated, and the few, the very few, who remained, almost forgetful of his existence. But a childless widower, in independent circumstances, Mr Tracey was not long without relatives who proved their affinity; and after a severe but half-concealed struggle, Mr and Mrs Compton were the successful candidates, under whose roof Mr Tracey took up his abode. Shortly following that event, a little stranger arrived, who was named, after his godfather, James Tracey Compton; and now, after eight years of devoted attention, the anxious parents' hopes were in some degree realised. Mr Tracey had not forgotten his godson in his will; indeed, he was the only relation he seemed to have remembered. About three hundred a-year was bequeathed to little James on his reaching one-and-twenty; and the remainder of his property, amounting to several thousands, was divided between a few inconsiderable legacies and bequests to charitable institutions.

It was the day following that on which Mr Tracey died, but the mournful necessary arrangements had been made, and the will read the preceding evening. Mr and Mrs Compton had deserted their usual sitting-room, as being a storey nearer to the chamber of death, but were, nevertheless, sitting very cozily after dinner in their back parlour, the young legatee being present.

"Well, James, my boy," said the father, patting his son's head caressingly, "at all events you cannot be a beggar, though I did think your poor godfather would have provided more handsomely for you. *He* was not blind or deaf; I wonder what on earth could have put it into his head to leave his thousands to the Blind School and the Deaf and Dumb Asylum."

"At all events, I am glad he did not leave them over the way," chimed in Mrs Compton, with all the ill-nature of a selfish, cunning, and narrow-minded woman.

"I fancy, my dear, you took care of that," rejoined her husband, while they exchanged looks in which the ghost of a smile was on each face visible.

Now, "over the way" was a comprehensive phrase, signifying Mr and Mrs William Compton and their six children. It must be acknowledged that, in a worldly sense, the elder brother had been the more prudent. He had established himself in a thriving business before he thought of looking out for a wife, while, about the same time, his brother William, though some years his junior, fell in love, without being at all on the "look-out" for such a catastrophe, and married as soon as it was possible (to use a homely phrase) to make both ends meet. His family increased in at least an equal proportion to his means; so that, at the time of his cousin Mr Tracey's death, he, with his six children, occupied a smaller house, kept fewer servants, and in every respect a more moderate establishment, than his elder brother, who was blessed, or encumbered, with one only child, the James Tracey to whom we have before alluded. We question if it is a good plan for relatives to live so very near to each other as "over the way" implies that the Comptons did. They often become *too* intimate, and get a habit of interfering with things that do not concern them. To do justice, however, we must own that Mrs William was a very amiable woman, a great deal too much occupied with her own family to trouble herself about other persons' concerns; and in the family disputes which had arisen, the elder lady had usually been the aggressor. It was quite natural that the younger couple should, and quite true that they did, anxiously hope Mr Tracey would leave legacies to their children, but they were quite prepared for their disappointment. *They* had had no spacious apartments to offer him, and they were even aware, that when he had visited them, the necessary unquiet of a small house which contained so large a family, was any thing but agreeable to a nervous invalid. Latterly, however, they had been conscious of a sinister influence, though, had they known precisely in what manner it had been exerted, perfect candour on their part would have been more than a match for the duplicity of their enemy. But this was not the case; poor Mr Tracey's behaviour for the last two years had grown gradually cooler and cooler, and yet there had been neither word nor action sufficiently marked to demand an explanation of it. This is a common state of things, and it must be confessed that the pride which accompanies a clear conscience in such matters often stands in the way of one's worldly interest. In a downright, tangible quarrel, even the party offending is seldom the one first to hold out the olive branch; but the case of the secret maligner is far worse, for he has the advantage of making the first or "proof" impression, and the credulous listener seldom opens his eyes and ears of his own accord to the other side of the question; nay, if pride does yield, and the innocent volunteers a defence, facts, circumstances—the very flood-gates of truthful eloquence—must be opened before the "stuffed bosom" can be cleansed of the "perilous stuff which weighs upon the heart."

Unfortunately, the latter plan had not been adopted by the younger Comptons, and Mr Tracey died with the firm conviction that every trifling act of kindness and civility had been dictated by the hope of a legacy, and that even the children had been tutored to please him; faults also had been hinted at which did not exist, and to the most innocent observations a false meaning had been given. Surely nothing under the sun is so easy as misrepresentation, except—telling the truth. Of course, Mrs Compton senior had *insinuated* (it was out of her line of policy to assert) that she and her husband were not "beggars"—they wanted nothing from him—which, we are afraid, if sincerely believed, is a most persuasive argument with a certain class of persons who have money to leave. These people have such a dread of their money being spent—not considering that, wisely distributed, one spring may fertilise many plains, and make seeds grow where all before was barren. Certainly, even a few hundred pounds to William Compton would have smoothed an anxious brow, and spared many an act of self-denial; however, he and his family did without them.

Of the worldly retribution so often remarked, nothing is more common than to find money, not altogether honestly acquired, either in a few years scattered to the winds, or become a source of misery instead of a blessing to the possessor; and so did it in some degree prove with Master James's legacy. The assurance that he would not be "a beggar," was at first used by his parents as an encouragement to good behaviour, and to exert himself in his studies, that he might be the more worthy of, and fit for, his lucky destiny; but as years passed on, he contrived to wrest the argument from them, and turn it as a weapon against themselves. It was all very well for his cousin William (a boy of about his own age) to fag and make the most of his time; but for himself, *he* shouldn't be obliged to go into a counting-house at fifteen—*he* shouldn't be a "beggar." A pretty life they had with the hopeful youth long before he was that age.

As for "the people over the way," they kept on their even course. The families visited occasionally, and maintained to the world a tolerable appearance of cordiality, though Mrs Compton abated not one jot of the malice and uncharitableness which rankled at her heart. Envy, too, was there; for ever since she had known her she had envied Mrs William's youth and good looks (youth always remains comparative), and now she envied her her tractable, well-managed family. Certainly, a school, or an assemblage of children, is a miniature world, in which each, generally speaking, finds its level, and it is usually an excellent discipline for only, or spoilt, children. The consequence the young heir assumed almost immediately after Mr Tracey's death, was not lost upon his sprightly cousins. At first, they could not quite make out why he had grown so fond of playing at "grand people" (what a study of character it is to watch children's play!) and at "fine houses," where he must always be the master; but at last it came out, and what a laugh there was! With one sweep of his foot, little William knocked down a make-believe house, which had been manufactured of tables, chairs, and boxes, and, mounting in glory upon the loftiest of the ruins, he exclaimed, "Now, Master James, I want to know exactly what you mean by a 'beggar!'"

This was a question which might have puzzled a much wiser head to answer. It *did* occur to the young heir to tell his cousins that they were often called "beggars;" but there was something in William's manner which told him it would not be quite safe to venture so far, so he stammered out, that "papa and mamma called people who had no money 'beggars.'"

"Oh! then, we shan't be beggars," rejoined William, "because I mean to make a fortune, and one rich man in a family shows the others the road."

The sisters, who were a little older, had not joined in the noisy play; but Emily raised her eyes from her work, and, with an arch look, said very quietly, "When you have quite done with Susan's box of colours, I am sure, James, she will be glad to have it back again, for she had begun to paint the green parrot that hangs out in the next balcony before she lent it you; and there it remains in her portfolio, one wing penciled and the other green, just as if he were half plucked for roasting."

This was really spiteful, for the sisters knew perfectly well that the colours, every one, were either spoilt or lost; and so, with a red cheek, Master James confessed.

"Never mind," continued Emily, "you know, instead of pocket-money, mamma pays us for the work we help her with; and we have saved up three and sixpence already towards buying a new box."

"And when do you mean to begin to write your own Latin exercises, Master James?" chimed in Susan, perhaps a little vexed at the loss of her colours.

The poor child burst into tears, exclaiming, "Oh! you tell-tale!"

"No, Jemmy, I didn't tell; indeed, I didn't," replied William, jumping down from his throne.

"No, he didn't tell," echoed the sisters; "we found it out. We saw it on the slate, and we knew *he* was through that book six months ago."

"Oh! you dunce!" lisped an urchin of six years old.

The young heir was glad to beat a retreat; the odds were against him.

It was a short scene of a drama, acted in the miniature world to which we have alluded; and had there not been a counteracting influence at home, Master James Tracey Compton might have gained a useful lesson from it. He might have comprehended that the term "beggar" applied to himself rather more than to his cousins, and thence have suspected that neither money nor station places us beyond the need of assistance from our fellow-creatures. But no such wholesome seed was allowed to germinate. He told his story—was pitied and caressed; a handsome box of colours was sent, out of pique, to Susan (the only person who benefited by the circumstance); and a childish quarrel, the bitterness of which might have passed off in a few hours, and yet some good effects have remained, was fretted and swelled till Master James fancied himself shamefully used by his cousins. Poor child! his parents were far more to be blamed than himself; and assuredly they reaped their reward. They taught him to cringe to those above him, and to scorn an obligation from such as they considered were beneath him; they repeated so often the advantages of his independence, that he grew to consider it an inexhaustible sum, and one which was to exempt him from all toil or trouble. It took about seven years to convince them of their error, and then they tried to repair it—by telling a lie. They hinted that the property was contingent on circumstances—that they could prevent his touching it; but he had a keen memory, and recollected, child that he was, hearing the will read. Any lingering respect there might have been, the discovery of a mean falsehood shook off, and, before he was eighteen, Master James Tracey had plunged into a headlong career of folly and extravagance.

Mrs Compton grew more cross, discontented, and ill-natured than ever. At the very time that her darling son had become the plague of her life, all "the world" of their acquaintances were praising the steadiness and good conduct of William, who had entered a merchant's counting-house, and had contrived, although still so young, to make himself of the greatest consequence in it. A blow, too, had been threatened to the pride of the family by the rumour that Emily was endeavouring to establish herself as a teacher of music and singing, and the consummation was only prevented by a very opposite, and to Mrs Compton, perhaps, a more vexatious, catastrophe. A young gentleman, with excellent prospects, had thought proper to fall in love with and marry her. Susan, whose taste for drawing had always been remarkable, had devoted herself to miniature painting, and though little more than twenty, already earned quite enough for pocket-money. It was ridiculous to call the girls "beggars" any longer. Neither was Mr James Tracey himself by any means exempt from the inward feeling of envy and the outward show of scorn which characterised his mother's sentiments towards their poorer relations; and before he was one-and-twenty, two circumstances occurred which appeared to him insults as well as injuries.

Like most extravagant persons, Mr James was not very particular and punctual on the nice point of paying debts; and on one occasion his cousin William chanced to be with him when a tradesman made some little demur before acceding to his demands. He was quite aware that James was a minor, and the article, a gun, not being absolutely a necessary, he thought the young gentleman's honour not the best security he could obtain. But he knew the character of the cousin, and turned to him saying, "If you, sir, will promise it shall be paid for at Christmas, I have not the least objection."

More than half offended at the tradesman's doubts, and never suspecting the honest intentions of James, he answered, without a moment's hesitation, "Certainly, I will take care you are paid."

Here was a mortifying example of a "beggar's" reputation being worth more than the expectations of a young gentleman of property; yet before Christmas arrived the affair was nearly forgotten, and William paid the twenty pounds out of his own earnings. It is true, his cousin afterwards refunded it; but what then? He had submitted to obligation from William only because he dared not mention it at home. As for William, it was certainly hard to be called on to spare such a sum from the sweet money he had *earned*—that money which seems beyond any other so especially one's own—but it was preferable to forfeiting his word. The next preference, however, which was shown, was one far more difficult to pardon.

For once the views of Mr James Tracey and those of his parents chanced to coincide. He fixed his affections on one of the belles of the place, Alice Merton by name, who was pretty and clever, and, moreover, entitled to five thousand pounds, independently of the fortune it was probable her father would leave her. But she actually preferred "poor" William. Whether it was on account of the three or four inches in height by which he outstripped his cousin James, or that his hair was darker, or that his voice was deeper, or that the pretty Alice suspected he loved her the better of the two, it is impossible to decide, for there is no accounting for the caprices of women. However, "the course of true love never did run smooth," and on this occasion the "flinty-hearted" father most decidedly favoured the views of the wealthier aspirant. James had been articled to a solicitor (the law seemed a profession suitable to his prospects), and though he had been any thing but studious, by dint of "grinding" and "cramming" he managed to pass his examination. With a portion of his fortune the share of a business in his native town was purchased, and thus seemingly established, to the elders on both sides, as well as to the gentleman himself, the match seemed in every respect desirable. Poor Alice! what an array against her—and what bitter tears she shed! Still, though like a reed she seemed bent to the earth, the firm spirit of her resolves was not broken.

They had long loved each other, but only in a moment of sorrow did the secret escape the lips of William Compton. It is true he had never lost sight of the one great object which had been the ambitious hope of his childhood, namely, to achieve something more than independence; but he was still far from the goal, and he felt he had no right to ask the hand of Alice Merton. Yet when deep emotion and the strong temptation of opportunity had wrung the truth from him, he certainly had not philosophy enough to do other than rejoice in the sweet promise of her affection—for she did promise that though she would not wed in opposition to her father's wishes, she would at least be firm in the rejection of all others. We do not believe the pretty Alice ever made any appointments with her lover, though it was strange how very often they *chanced* to meet. However, a trial of their constancy was at hand.

We have said that William Compton had contrived to make himself eminently useful to his employers—so much so, that his salary had been regularly increased; but the sudden death of the most active partner determined them to send William to London for the next twelve months, for the purpose of conducting their business in the metropolis. Assuredly, he felt that the implicit confidence they placed in his talents and integrity did him honour, and would most probably prove one of those stepping-stones to fortune which *do* occasionally present themselves to such as have eyes to see, and skill to take advantage of them. Still, it was a hard trial to part from Alice, and he was forbidden even to write to her. Such a separation *is* a trial of constancy, very different from the condition of those who, thanks to the humane dispensation of the penny post, may "waft a sigh," every day if they will, from one heart to the other. Letters under such circumstances may be *all true*, without containing *all the truth*. Like our earth, which is half in light and half by itself shadowed, is the human character; but in such a correspondence the bright sides only are shown, and, aided by that burning-glass the imagination, there is little chance of a year's absence cooling the lover's passion. No, no, no; an absence brightened by unrestrained and frequent letters is not so great a trial of constancy as daily intercourse may chance to prove, for *there* the dark side is turned occasionally—faults and follies are sometimes seen.

But to return to William and Alice. Mr Merton positively forbade all communication between them: although a little struck by the evident consideration in which William was held by his employers, he rather implied than promised, that if, at the expiration of a year, the young people were in the same mind, he would consider the subject. Here was an inch of ground on which hope built a fairy castle. They felt the justice of the case, and parted. We believe they loved each other with a confidence that was superior to jealousy; still, during a whole year deprived on each side of one fond assurance, they would scarcely have been human had not William sometimes envied, if he did not fear, his cousin's opportunities of pleasing Alice Merton; and had not she pictured with a sigh the many fair faces he must meet, and questioned for a moment if they would draw him from his allegiance.

But the year had nearly passed—for the lovers parted in June, and May was come—when James Compton renewed his addresses more pertinaciously than ever. It was, however, remarked that on this occasion Mr Merton gave him but slight encouragement. The truth was, that rumours had reached him that the concern into which Mr James had entered was not in the most flourishing condition. He had brought money into it certainly, but he had neither improved it by connexion nor his own perseverance. From an inaptitude for business habits, he was either behind in his duties, or a dupe: this perhaps might have been amended; but his ignorance of the value of money and love of petty indulgences spoiled all—as a sagacious neighbour very graphically observed, "That young gentleman's expenditure on kid gloves and cigars would certainly form a very handsome revenue for many a respectable family." What with one thing and another, a great portion of Mr James's property was sunk, and what income he might draw from it was at least problematical. The idea of such a personage claiming the affections of Alice Merton was unutterably ridiculous.

Mr Merton, as we have said, knew something of all this; and Alice's spirits rose when she felt that her father was becoming her ally, and she looked forward with trembling hope to the next month. The first week came, the second—three more days, and the twelvemonth would have expired. It was the second morning from this time that Alice descended to the breakfast-room a few minutes before her father, and beheld, conspicuous among a heap of letters, a thick packet directed to him, in the handwriting of William Compton. Tears sprung to her eyes, and she raised the packet to her lips; but she could not have encountered her father at that moment for worlds. She bent her steps to the garden—not that she expected William to be there, for the term of his probation had not expired, but it was a holy spot, endeared to her by the tenderest recollections. It was full a quarter of an hour before she returned to the breakfast-room; her father had waited with exemplary patience for her fulfilment of the duties of tea-maker, although he had been down stairs long enough to read *all* his letters; he did not, however, make an observation upon one of them.

Surely that day was the longest poor Alice had ever known; and it is doubtful if the night was shortened by sleep. Morning came; a thin mist had been raised like a veil from the earth, and the thirsty sun was quickly drinking up the drops of dew which still hung upon the roses, when Alice Merton stood at the garden gate; but not alone this time. The tried one was there, who came to prove his faith. Ah! that hour made ample amends for a year's pain; indeed, some people would think a year of very tolerable enjoyment might fairly have been bartered for it. There was a third to breakfast that morning; but first, William Compton told to Alice the contents of the yesterday's letter. He had been made a partner in the house he had so faithfully served, and that packet contained a copy of the deed of partnership. He was now a suitable match for the pretty heiress.

A great change came over the Compton family. Within the next year William and Alice were married; but he did not forget his childish promise of showing his younger brothers the road to riches. Now that the family were grown up and settled, it was astonishing what a pretty and commodious house that of the younger Comptons became. Throwing two rooms into one, and new furnishing, made a vast difference. As for Mrs Compton senior, she had a serious fit of illness, said to be brought on by fretting at the good fortune of "the people over the way," and at her own son's disappointments. Instead of blaming her own folly, and learning, however late, a useful lesson from its consequences, she took to scolding and reproaching the "fortunate legatee" more unmercifully than ever. This state of things could not last. He left home in high dudgeon; and as he had not courage to break through the habits of idleness he had formed—and as his property was dwindled to a mere pittance—and as, of course, "to *beg* he was ashamed"—he has married a rich widow nearly double his age. Her fortune, to be sure, is settled on herself, still he derives many advantages from it.

If any parent is led to reflect on the folly of teaching children to rely on adventitious circumstances, instead of on their own conduct and exertions—or if the thoughtless but common and obnoxious term "a beggar" is in one proper instance withdrawn—this sketch from the life will not have been written in vain.

POPULAR INFORMATION ON SCIENCE.

NITROUS OXIDE (LAUGHING GAS).

One of the most remarkable, though not by any means the most gravely important, scientific discoveries of the last age, was that of the effects of nitrous oxide upon those who breathed it. To hear that the chemist could produce a gas which, when inhaled into the lungs, threw the tamest philosophers into a state of mind resembling that of the excited bacchanal, was calculated to strike all with astonishment; and such was really the effect of the discovery. For a time, the laughing gas, as it was called, was the theme of every mouth; and many who had never given a moment's thought to chemistry, when it was working out principles of the greatest consequence to the weal of mankind, lent it a delighted attention when they heard that it could intoxicate them, if they pleased, by a few mouthfuls of an impalpable fluid.

The early experiments upon this gas were attended by circumstances of high moral interest. Towards the close of the last century, a young man, whose early days had been partly spent in a druggist's shop at Penzance, was promoted to a situation in a medical institution in Bristol, where an association of physicians were endeavouring to add to the resources of their science by investigations in pneumatic chemistry. He was obscure and unrecommended, but possessed genius, with all its usual enthusiasm. This, in short, was no other than Humphry Davy, ultimately the most eminent British man of science of his day. It was his duty to make experiments on various aëriform fluids, with a view to ascertain their effects on the human constitution. One of those which he thought worthy of investigation was nitrous oxide—a gas, however, of a very formidable kind, seeing it is nearly allied to one of the most noxious fluids with which we are acquainted, *aqua fortis*. This terrible association of ideas had no effect in restraining Mr Davy. After some preliminary experiments in breathing the gas diluted with common air, and finding no

results of any consequence from it in that state, he resolved to inhale it in its pure form, although it was impossible to tell that the first inspiration would not destroy him. He obtained it in this condition by the decomposition of a salt known by the name of nitrate of ammonia, by the application of a regulated heat; and, on the 11th of April 1799, he first inhaled it into his lungs.

Finding that a single inspiration produced no uneasy feeling, he became convinced that a further trial might be made without danger. This was done a few days after, when Dr Kinglake was present. From a silk bag containing three quarts of the gas, he breathed in and out for three minutes, and experienced "an uncommon sense of fullness in the head, accompanied with loss of distinct sensation and voluntary power—a feeling analogous to that produced in the first stage of intoxication, but unattended by pleasurable emotion. Being still doubtful whether the gas was stimulant or depressing, he tried another experiment next day; and now, for the first time, after a repetition of the former feelings, experienced that pleasurable thrilling for which the gas was afterwards so celebrated. His hearing became more acute, and the objects around more dazzling. He was irresistibly prompted to make a variety of lively movements throughout the room. These effects did not subside for ten minutes; but so completely did they afterwards vanish, that he was next day sceptical as to their having taken place. On this point, however, he was quickly resolved by the results of fresh experiments, both upon himself and others. To pursue his own modest narrative—"Having thus ascertained the powers of the gas, I made many experiments to ascertain the length of time for which it might be breathed with safety, its effects on the pulse, and its general effects on the health when often respired. I found that I could breathe nine quarts of nitrous oxide for three minutes, and twelve quarts for rather more than four. I could never breathe it in any quantity so long as ten minutes. Whenever its operation was carried to the highest extent, the pleasurable thrilling, at its height about the middle of the experiment, gradually diminished; the sense of pressure on the muscles was lost; impressions ceased to be perceived; vivid ideas passed rapidly through the mind, and voluntary power was altogether destroyed, so that the mouth-piece generally dropped from my unclosed lips." He adds—"Generally, when I breathed from six to seven quarts, muscular motions were produced to a certain extent; sometimes I manifested my pleasure by stamping or laughing only; at other times, by dancing round the room and vociferating."

Our intrepid young chemist did not stop here. He felt anxious to ascertain how far there was a resemblance between the sensations experienced from nitrous oxide and those attending the breathing of the gases which are declaredly fatal to life. Some of these gases he inhaled with the same fearless boldness: we have from him an account of his taking *three* draughts of hydrocarbonate, and falling into total insensibility—he was certain that *five* would have killed him! On another occasion, he took one scorching draught of *nitrous gas*, and afterwards thought it likely that he only escaped destruction from it, in consequence of his lungs being at the moment pre-occupied by a portion of the nitrous oxide or laughing gas.

Anxious to compare its effects with those of alcohol, he, although a habitual water-drinker, ventured on drinking a whole bottle of wine at once. He dispatched it in large draughts within the space of eight minutes. "Whilst I was drinking, I perceived a sense of fullness in the head, and throbbing of the arteries, not unanalogous to that produced in the first stage of the nitrous oxide excitement." The other consequences were those which usually attend an excess in wine. During the debility afterwards, he took nitrous oxide without increasing the debility. On a subsequent occasion, he submitted to an experiment of an extraordinary kind, in order to ascertain if an excess of the laughing gas would produce the same debility as that attending a common wine debauch.

"To habituate myself," he says, "to the excitement, and to carry it on gradually, I was enclosed in an air-tight breathing box, about the capacity of nine cubic feet and a half, in the presence of Dr Kinglake. After I had taken a situation in which I could, by means of a curved thermometer inserted under the arm, and a stop-watch, ascertain the alterations in my pulse and animal heat, twenty quarts of nitrous oxide were thrown into the box. For three minutes I experienced no alteration in my sensations, though immediately after the introduction of the nitrous oxide the smell and taste of it were very evident.

In four minutes I began to feel a slight glow in the cheeks, and a generally diffused warmth over the chest, though the temperature of the box was not quite 50 degrees. I had neglected to feel my pulse before I went in; at this time it was 104 and hard, and the animal heat was 98 degrees. In ten minutes, the animal heat was near 99 degrees, in a quarter of an hour 99·5 degrees, when the pulse was 102 and fuller than before.

At this period, 20 quarts more of nitrous oxide were thrown into the box, and well mingled with the mass of air by agitation. In twenty-five minutes, the animal heat was 100 degrees, pulse 124. In thirty minutes, 20 quarts more gas were introduced. My sensations were now pleasant; I had a generally diffused warmth without the slightest moisture of the skin, a sense of exhilaration similar to that produced by a small dose of wine, and a disposition to muscular exertion and to merriment." * * *

At three quarters of an hour, 20 quarts more were admitted. "I had now a great disposition to laugh; luminous points seemed frequently to pass before my eyes, my hearing was certainly more acute, and I felt a pleasant lightness and power of exertion in my muscles. In a short time, the symptoms became stationary."

After having been an hour and a quarter in the box, Mr Davy came out, and instantly began to respire twenty quarts of unmingled nitrous oxide. "A thrilling, extending from the chest to the extremities, was almost immediately produced. I felt a sense of tangible extension highly pleasurable in every limb; my visual impressions were dazzling, and apparently magnified. I heard distinctly every sound in the room, and was perfectly aware of my situation. By degrees, as the pleasurable sensation increased, I lost all connexion with external things; trains of vivid, visible images rapidly passed through my mind, and were connected with words in such a manner as to produce sensations perfectly novel. I existed in a world of newly-connected and newly-modified ideas. When I was awakened from this semi-delirious trance by Dr Kinglake, who took the bag from my mouth, indignation and pride were the first feelings produced by the sight of the persons about me. My emotions were enthusiastic and sublime; and for a moment I walked round the room perfectly regardless of what was said to me. As I recovered my former state of mind, I felt an inclination to communicate the discoveries I had made during the experiment. I endeavoured to recall the ideas—they were feeble and indistinct. One recollection of terms, however, presented itself; and with the most intense belief and prophetic manner, I exclaimed to Dr Kinglake, 'Nothing exists but thoughts; the universe is composed of impressions, ideas, pleasures, and pains.'" This dose was repeated immediately after, completing what might well be called a debauch of nitrous oxide. But, unlike the case of the wine debauch, no unpleasantness or debility followed; on the contrary, the experimenter continued to be unusually lively and active during the remainder of the day.

Many other persons, including Mr Southey, who then resided at Bristol, consented to inhale nitrous oxide; and generally there was a variety of experiences in the different cases, though increased vividness of sensation and sense, and a current of agreeable ideas, were nearly uniform results. One person said that he had been excited exactly as he once was by witnessing a heroic scene upon the stage. Another compared his sensations to what he experienced when he heard an orchestra of seven hundred instruments performing the Messiah at the commemoration of Handel in Westminster Abbey. We are inclined to believe that the variety of the sensations of different persons from nitrous oxide, has never been observed with the care which the importance of the subject demands. If the different affections of different persons bear any relation to their leading and ruling passions, or to what are now called their temperaments, it would be an extremely curious fact brought to the too little cultivated field of mental science. On this subject, we present the principal part of a letter addressed to us by Sir George S. Mackenzie, Bart., in which he describes an experiment with laughing gas upon a group of remarkable men, some of whom are still living. We shall allow Sir George's views, which are those of a phrenologist, to speak for themselves.

"According to my promise, I now send to you in writing what I told you respecting the effects of a dose of the laughing gas on different individuals, whose constitutions or temperaments were considerably dissimilar. Of these I must speak in doubt; for, at the time I witnessed the scene I am about to describe, the doctrine of temperament had not been promulgated, nor was the influence of organisation on the manifestation of mental faculties known. Still, I have a pretty distinct recollection of the forms and appearances of two of the individuals I shall mention, who are dead, and if I be mistaken as to the living, you have it in your power to correct me.

The value of the facts I will state is not trifling, whether they are viewed physiologically or psychologically. The gas was very carefully prepared by the late Dr Kennedy, whose name is associated with that of Sir James Hall in his experiments on greenstone and lava, and whose death in 1803 deprived his country of the most accurate analytical chemist of his time. There were assembled at his house Professor Dugald Stewart, the Rev. Sydney Smith, John Leyden, George Cranstoun, Esq., Sir William (then Mr) Forbes; and I think Lord Webb Seymour and Professor Playfair were also present.

Professor Stewart was the first who breathed the gas. His temperament, I think, was nervous-bilious. Before it was administered to him, he expressed himself sceptical in reference to its effects, and said that we should hear him count the number of books on a shelf in front of him, while under its influence. While he was inhaling the gas, he kept his eye steadily on the books; and when the pipe through which he breathed was withdrawn from his mouth, he pointed with his finger, and attempted to count, but completely failed. He had all the appearance of being drunk; and such, he afterwards stated, was his sensation.

Mr Cranstoun was the next subject. His temperament, I believe, is chiefly nervous, with a little of the lymphatic. After he had inhaled the gas by three or four inspirations, he threw one arm over the back of the chair, and his head fell on his shoulder. His countenance became deadly pale, and we were a good deal alarmed. I ran for water, and when I began to sprinkle it on his face, and tried to rouse him, he said in a low voice, and with some hesitation, as if it were a trouble to him to speak, 'Let me—alone, I'm—in—heaven.' Assured by this, we ceased to trouble him. He remained for three or four minutes in the same position, till the gas ceased to operate. He lamented the cessation of feelings, which he described as exquisite.

I had been several times before under the influence of the gas, and its effects on me were known to have been so different from what had been just witnessed, that I was requested to become the next subject. I begged of all present to keep out of my way, for though I should do all I could to repress the strong desire to exert my muscles, I might upset some of them in trying leap-frog, or some such freak. The taste of the gas is very much like fresh liquorice root. At first I felt a singular tingling proceeding from the extremities towards the body. Then the brain became affected, and I imagined I possessed the strength of Hercules; and the propensity to muscular exertion became irrepressible. Away went the bag containing the gas—up I started, and ran about, leaping over chairs and tables, feeling as if I flew, and not heeding damage to my shins and other casualties that occurred during my violent frolics. During the rest of the day I felt exceedingly happy, and laughed in every body's face whom I met on the street. My temperament is sanguine-bilious, with some portion of the lymphatic. I have nothing of the sanguine complexion except blue eyes, but my chest is of great size.

Sir William Forbes, when under the influence of the gas, imagined he was at the head of his own table enjoying himself with his friends, and became quite uproarious about filling bumpers and fresh bottles of wine. In mixed company Sir William was quiet and reserved, and he was only at his ease with his particular friends, among whom he had now to reckon the gas, which took away all feeling of shyness. The temperament, I think, was bilious-nervous. The most remarkable exhibition was that made by John Leyden—of sanguine-nervous temperament, and an odd being in his way. I was standing at the fire-place with the Rev. Sydney Smith, when I observed Leyden, after he had inspired the gas once or twice, fix his eye with a peculiar expression on our reverend and facetious friend, whose attention I immediately directed to it. We stood wondering what was to happen, when Leyden started up, clenched his fists, and holding them up, still fixing his gaze on Mr Smith, marched slowly towards him, with the exclamation, solemnly pronounced, 'Confound him—I'll murder him now!' Notwithstanding this alarming threat, and the ferocious expression of his countenance, it did not appear he had any intention of slaying his friend; for he stopped short, as if something had turned the current of his thoughts into a new direction, and the influence of the gas gradually ceased, and his expression became almost that of a fatuous person for some moments. From the account he gave of himself, it did not appear that his reverend friend was the special object he had in view, and that the fixing of his eye and his marching towards him were accidental. His organs of ideality and destructiveness had been for the time excited, and he was in a sort of dreaming delirium.

Phrenology not having been known in those days, nothing can be said of the effects of the gas in reference to cerebral development. But there can scarcely be a doubt that in many persons, though not in all, the predominant cerebral organisation would be chiefly excited. It strikes me that considerable light might be thrown on the doctrine of the temperaments by experiments with the gas, made on men of philosophical minds, who, being aware of the object, would attend to the inward effects, while others observed the manifestations. After a good many trials, I at length could sit still under the influence of the gas, and attend to my feelings without yielding to them.

It appears to me important to ascertain the influence of various substances on the nervous system, and the modifications of temperament which they may effect, as well as their special effects on particular organs. It is known that morphine gives confidence where it may be wanting, and excites the organ of language; while tea, and especially strong coffee, excite the intellectual and reflective faculties. But no attention has yet been paid to such effects in reference to proportional organisation or temperament. The effects of the introduction into the lungs of certain gases, on the temperature of the body, may assist in testing Liebig's discovery of the liver being the furnace in which animal heat is produced by the slow union of oxygen and carbon without incandescence. Various

substances taken into the stomach cause an increase of temperature, by an over supply of carbon. The thermometer may become as useful as the stethoscope in directing to the seat and to the nature of disease; for we know that different parts of the body indicate various temperatures, in different states, though little or nothing has yet been done to render this fact available. As increased heat is a symptom of fever, if Liebig's discovery be true, then hepatic derangement is clearly indicated, as well as the remedy—a diminished supply of carbon and oxygen. Coldness of the extremities, likewise, would indicate hepatic derangement of another kind, and indicate a further supply of the same things. But the cause may be found in both cases not to be an over nor an under supply, but an organic defect, preventing the union of the two substances, or rendering it too facile. The great difficulty to be encountered are the periodical accessions; but even this may be removed by judicious experiments, now that we have a theory to be tested. The stomach, the lungs, and the skin, are the means of access for introducing into the system whatever we may imagine to be remedial substances. In the stomach and lungs analytical and synthetical processes go on which to us are mysterious. Still, as it has been discovered, in respect to the vegetable world, that the proper articles for sustaining vegetable life may be presented in a compound form with success, we may predicate of animal life, that changes in the composition of the atmosphere in which patients may be placed, and attention to the proportion of carbon in their food, may effect changes of temperature, and remedy functional disorders in the liver, if it really be the body's fire-place. No effects of the laughing gas have been attended to except external manifestations; and these have been the objects of mere curiosity, and not of philosophical investigation, for which a wide and interesting field is open. It is well known that certain substances taken into the stomach of many persons produce no particular sensation, while they prove irritating and poisonous to others. We have seen some variety of effect from the laughing gas in the cases I have described as merely curious; and I hope that some medicine philosopher will take up the subject—indeed, not one, but many, as the field is so extensive. A knowledge of phrenology will greatly assist."

It may be mentioned, in conclusion, that nitrous oxide has not proved of any important service in medicine. The views as to the gases which originated the Pneumatic Medical Institution at Bristol have all been disappointed; but while the name of Davy shall survive to the respect of the world, that institution can never be forgotten.

CAPTAIN BARCLAY'S AGRICULTURAL TOUR.

In the month of April last year, Captain Barclay Allardice, of Ury—a gentleman who a number of years ago distinguished himself by his feats in walking, but has latterly occupied himself on his estate in the north as an improver of breeds of cattle and of agriculture—proceeded on a tour to the United States of America and Canada, of which, since his return, he has favoured the world with a neatly written account.* The principal object which this enterprising gentleman had in view in his visit, was, as he informs us, to examine the condition of the rural affairs of the States and Canada, in order to assist a near relative to determine in which a purchase of land should be made. The nature of the captain's inquiries appears to us to bear so materially on the designs of intending emigrants to America, that we propose giving a glance at them for their benefit, referring to the work itself those who are desirous of full information on the subject.

The line of route pursued began at Massachusetts, near Boston; then to New York, and thence, by the Hudson, to the western parts of New York state; the frontier was next crossed into Canada; and a return made to New York by Pittsburg, and different parts of Pennsylvania—the whole occupying ten weeks of the summer of 1841. The observation made by the tourist in every quarter of the states, was that there was great natural fertility in the soil, much that was very beautiful in the scenery, and not less to praise in the manners and appearance of the people; also, that in most places land could be obtained at moderate prices; but that every where there prevailed the same objectionable system of agriculture—no attention paid to breeding stock, no process of manuring, no leases granted to tenants, each being allowed to crop his land as he pleases; and, consequently, there is a prodigious waste of means and resources. The leading error is inattention to what is called *concertible husbandry*, or the proper rotation of crops, by which a sufficiency of green food would be raised to feed stock during winter, so as to use up the straw, and produce a quantity of restorative materials to the soil. The common practice, the captain mentions, is to grow clover along with wheat; the wheat is reaped, and, after being thrashed, the straw is burnt in order to get rid of it; the clover, after being suffered to grow till the second summer, if so long, is ploughed down as manure. The result of all this is, that the land does not yield half the grain crop it should bear, and the breeds of cattle are poor and ill-kept. Another result will by and by become painfully apparent—the land will be deprived of all its nutritive properties, and, unless where there is a good subsoil to turn up, will be a *caput mortuum*—vegetatively dead.

At the Genesee flats, a rich district of meadow-land beyond Albany, Captain Barclay visited the large farm establishment of a Mr Wordsworth, who conducted his affairs a degree better than his neighbours, but still very imperfectly. "He has a numerous tenantry, but under a tenure which can yield neither profit to the landlord nor benefit to themselves; they have no leases, but plough and sow from year to year, the landlord receiving for rent a portion of the produce in kind. His portion is ascertained on the field after the crop is reaped, and is delivered by the tenants at an appointed hour, where it is instantly thrashed out, and the straw given to the winds. Such a system must be a bar to every improvement; it in fact operates as a prohibition of all exertion and expenditure by the tenant for increasing the fertility of his farm—it being unreasonable to expect that any tenant will use exertions or lay out capital where the landlord is to reap, certainly a large share of the benefit thence accruing, and, from the precariousness of the tenure, perhaps the whole." It might have been added to this just observation, that in many parts of England the same yearly-tenant, or tenant-at-will system, prevails, so that in such places the land does not produce perhaps more than a half of what ought to be its legitimate crops.

Near Mr Wordsworth's, our tourist was shown two desirable estates for sale—"One of 300 acres, the other of 500, with a capital mansion-house and orchards on each; and I was told the price of such land in this locality ranges from L.10 to L.20 an acre." He visited the farm of a Mr Macnaughton, a Highlander, about sixty years of age, from Lord Breadalbane's country, who "came to America fifteen years ago, with a small capital, and now he possesses 500 acres of the best wheat land, all cleared, and his own property. He showed me a field of 60 acres of wheat, and mentioned, in connexion with it, a circumstance furnishing a striking instance of the rapid rise of the value of land in this quarter. Soon after his arrival, a neighbour wished to purchase this field of him, and he accordingly parted with it for 900 dollars, which was considered the full value of it. In the course of three years his neighbour determined on selling the whole of his property, and offered this field to Donald, but now at the price of 3000 dollars; this he at once agreed to give; a bargain was struck accordingly, and the first crop of wheat yielded the purchase-money."

At Caledonia, a town in the vicinity, the tourist procured an interview with a Scotsman, from whom, says he, "I learnt that 250 Scotch families are settled in this neighbourhood; the greater part of them came over forty years ago with very little capital, many of them with hardly sufficient to purchase a yoke of oxen; they all got wealthy, and now they own farms varying from 200 to 600 acres each."

The captain now crossed at Niagara into Canada, where he was shocked with the different aspect of affairs. "On entering Canada, I had been impressed with a marked difference between it and the United States. In the latter, the people were every where distinguished by that cheerfulness and appearance of contentment which attend activity and exertion in peaceful pursuits. In Canada, there prevailed an almost universal gloom, the consequence of recent internal commotion; of the still existing conflict and rancour of political feeling; or of the withered hopes of many who, having speculated largely in land, have received little or no return for their money. This was my early impression, and any thing I have since observed, or by inquiry ascertained, has served to confirm it, and to satisfy me, that of the two countries the States hold out, for agricultural pursuits, by far the greater advantages to persons possessed of any capital. With the exception of portions of cleared land, varying from fifty acres in some situations to several hundreds in others, Upper Canada is an immense and trackless forest, forlorn and forbidding at best, and in many places rendered more gloomy and repulsive by the trees having been burnt preparatory to being cut down, and consequently now presenting to the eye nothing but bare and blackened poles. And with regard to what is called cleared land, it consists of no more than a patch here and there, on which the huge pines that for ages had been tenants of the soil, have, by the application of fire and axe, been reduced to stumps four feet in height, so thick set as in many places to bid defiance to the plough, and to preclude any mode of cultivation except sowing and hand-raking the seed. There are here no railways, and no interior water-carriage, advantages so amply enjoyed in the States; and although there are roads, they are of such a description as to be nearly impassable, excepting in winter, when the sleigh is made use of. Upper Canada, too, is comparatively destitute of local markets, or of any proper outlet for the surplus produce of the land; for the population is not only thin and widely scattered, but themselves chiefly agricultural, each family therefore raising sufficient for its own supply; and there are no towns of any magnitude to create any considerable demand for the surplus, nor if there were, are easy means of transport afforded. In such circumstances, it is by no means surprising to find that the greater number of those who had speculated in land have suffered grievous disappointment, and that of those coming under the description of gentlemen who had attempted to convert the forest into cornland by the force of money, the greater number quickly got rid of it, and then either betook themselves to other pursuits, or, as sometimes happened, becoming disgusted and reckless, gave themselves up to dissipation."

The ideas of Captain Barclay on this subject are in unison with those of every impartial tourist. He thinks that Canada is chiefly to be recommended to poor and hardy labourers, who will be contented to erect a rude hovel of log, and clear a few acres of land for a plain subsistence. He says the price of clearing an acre of forest cannot be less than L.20, and for a lower sum an acre of good cleared land can be had in the States. We need not follow the captain through the remainder of his journey, but conclude with the advice which he offers to agriculturists who think of emigrating. "Where the British farmer is possessed of capital sufficient for the purchase, and also the *stocking and cultivating*, of a farm, he might certainly find his account in making a purchase in the States. From the generally moderate price of land, and the opportunity he would have of reclaiming a fertile soil, or, by his superior skill, rendering that which is already reclaimed greatly more fruitful, he might assure himself of such a return for capital as I believe is not to be had from agriculture in any other country equally abounding as the States are in all the comforts of life."

OCCASIONAL NOTES.

SCREWING DOWN TEACHERS.

In former notes, we adverted to the under-payment of teachers as one cause of the deficient supply of educational talent. Our remarks then had reference chiefly to stated salaries or endowments, as provided by town-councils and heritors. We would now address a few words to parents, on the too common practice of negotiating with teachers for a reduction of the school fees.

Some parents go to a school, as they would to a shop, to purchase a certain quantity of education, as they would food or clothing, at the lowest possible price. They inquire the amount of the fee, and whatever that may be, a guinea or a half-crown, they object, and propose an abatement. Their arguments are amusing: "Schooling is very dear to what it was when they were young—Mr So-and-so charges far less—teaching is but little trouble," &c. Others, we have heard, claim a reduction because the pupil is very young, or very *little*, quite forgetting that there is at least as much trouble in teaching a very young child as one more advanced, and that a greater amount of professional skill is requisite in the former than in the latter case. Parents of a third variety may be found demanding a discount because they have three or four to pay for; and they quietly hint, that if the teacher will not give education to *four* for *three* fees, he shall have none. Would these parties admit such a practice in their own trades or professions? Would a banker lend *four* hundred pounds for the interest of *three*? Would a landlord let *four* houses for the rent of *three*? Would a baker sell *four* loaves for the price of *three*? Again, a fourth class will advance many pleas to the same purpose; such as—"The boy joined the class a week after the quarter day; now, there are twelve weeks in a quarter, and the fee is six shillings; therefore sixpence must be deducted!" These people would be astonished, were they informed that the teacher, instead of granting a deduction, would be justified in charging *double* fee, as a trifling compensation for the extra trouble caused by his urging the laggard pupil on to overtake the class. They will also plead, "The boy was unwell for *three days and a half!*" In short, each economical father or managing mother believes that every shilling kept off the teacher is a shilling justifiably gained.

Besides these attempts at reduction, which every independent teacher should resist, there are others to which the benevolent must yield. A widow struggling to give her child a good education—a professional brother having a family to bring up on limited means—a merchant, suddenly unfortunate, whose children may have been with the teacher for years—all have claims upon his gratuitous services. Thus, if even those who are the most successful, and hold the most lucrative situations, realise far less than calculators suppose, how great must the privations be to men of very limited incomes, thus cruelly diminished!

In one word, let parents *economise* every where, that they may be generous, or at least *just*, to the most laborious and worst remunerated of all professions.

THE CONDEMNED GUN.

Juries are sometimes a set of very stupid people. At the trial of a gentleman for accidentally shooting his servant (thinking him to have been a robber on the premises), which took place a few weeks ago in an English provincial town, the jury returned a verdict of "a deodand of L.1 on the gun, which we recommend to be forthwith destroyed." Was there ever any thing to match the absurdity of this?—the gun, the unoffending instrument, the insensate material, is ordered to be put out of existence, for the murderous crime of which it has been found to be guilty! The thing reminds us of the consoling declarations of a nurse, when her baby knocks its head

against the table. "Come to me, my darling, and I'll pay the table—there, give it a good blow—the naughty table, to hurt my darling!" The jury on the gun case had received a good nursery training.

LIFE-PRESERVING CAPES.

A gentleman of Edinburgh, a member of the Skating Club, has invented what we have no doubt, if used, will save many lives, and at all events be a preservative from the unhappy consequences of "boat accidents." The plan, which we have inspected at the shop of the Albion Cloth Company of our city, presents a cape for the neck and shoulders, formed of Macintosh cloth, and which may be partially inflated with air at pleasure, by means of a small mouth-piece hid from external observation. The cape we saw is outwardly a greyish serge (it may, however, be made of any material), and hangs down all round as low as the elbows. A tape from the inner part of the back, to be tied round the body, keeps the cape down, in the event of immersion in water. When blown up, the cape swells to about an inch in thickness, which presents nothing unsightly; however, it need not be inflated till the wearer goes into a condition of danger —into a boat on a sailing excursion, for instance, or upon unsafe ice. As a piece of dress, it may be worn by ladies as well as gentlemen.

With respect to the buoyant powers of the apparatus, they have been the subject of a critical experiment by the Edinburgh and Leith Humane Society, which is mentioned in nearly the following terms in the newspapers of the day:—"The use of a large cast-iron tank or tun having been obligingly placed at the service of the directors by a brewer in Edinburgh, it was filled with warm water to the depth of six feet two inches. A stout man, a sailor, five feet six inches in height, and about ten to eleven stone weight, went into the water with his clothes on, wearing the safety-cape, and, to the satisfaction of all present, floated vertically at his ease, with his head, neck, and part of his shoulders, above water. Wishing to ascertain what degree of buoyancy he had to spare, weights were given to him, which he held in his hands. Seven pounds sank him to the throat, and four more to the lip; proving that he could have sustained another person in the water. The man came out repeatedly, and again plunged into the water, always declaring it difficult to immerse his head even for an instant. On this fact, the directors of the society found that, in the event of ice giving way under a skater, the reaction will effectually protect him till relieved from his perilous situation."

After this satisfactory testimony, nothing more need be said on the subject. It is quite clear to us, that if people would but be persuaded to wear one of these safety-capes, they need be under no apprehension whatever of immediate drowning in the case of sudden immersion in water; and it is well known that, except in shipwrecks at a great distance from land, a power of buoyancy for only a few minutes would save almost every life. The deplorable deaths from boat accidents on rivers, for lack of some such simple means of preservation, who can either number or sufficiently lament?

HEAT OF TEMPER.

It sometimes happens that a character generally amiable is marred by a certain fieryness of temper, which tends to lead its possessor into painful relations towards his fellow-creatures. The ordinary demeanour of such a person may be calculated to conciliate the greatest esteem; he may be remarkable for benevolent acts, incapable of any show of jealous or invidious feeling, and free from all the degrading vices. Yet, being at the same time prone to sudden and violent anger, and unable when in that state to control his actions, all these good qualities will go in a great measure for nothing, or only cause his fatal infirmity to be the more lamented. It is generally to be said in favour of such persons, that their passion, as it is easily induced, so it passes quickly, and that the moment it is past their usual benevolent feelings regain the mastery. They are even remarkable as a class for the ability to show a thorough and heartwarm forgiveness. But these circumstances, while pleading for a gentle judgment, do not save the man of hot temper from the natural consequences of such a peculiarity. It is not one of the least of these that such a man can rarely enjoy a steady and confiding friendship. The uncertainty of his demeanour—the chance of sunshine being in one moment, for no good cause, changed into gloom and thunder—makes it impossible for any one to be on perfectly cordial terms with him. Thus, his own habitual feelings of social kindness are constantly exposed to disappointment and the vexation of unrequited affection, and it can rarely be that he gets through life without sinking more or less deeply into the sordid mire of the misanthrope. Yet it is comparatively well for the irascible man if no worse befall him. Too often, under a moment's transient impetuosity, does he commit acts at which his better nature shudders, and which blight all the remainder of life. We shall relate a case in point.

About a mile from Edinburgh, there stands a solitary house named Marionville, enclosed in a square shrubbery of no great extent, surrounded by high walls. Whether it be that the place has become dismal in consequence of the rise of a noxious fen in its neighbourhood, or that the tale connected with it acts upon the imagination, we are at a loss to decide; but, unquestionably, there is about the house an air of depression and melancholy, such as could scarcely fail to strike the most unobservant passenger. Yet, little more than half a century ago, this mansion was the abode of a gay and fashionable family, who, amongst other amusements, indulged in that of private theatricals, and in this line were so highly successful, that admission to the Marionville theatre became a privilege for which the highest in the land would contend. Mr Macrae, the head of this family, was a man of good fortune, being the proprietor of an estate in Dumfriesshire, and also of good connexions—the Earl of Glencairn, whom Burns has so much celebrated, being his cousin, while by his mother he was nearly related to Viscount Fermoy and the celebrated Sir Boyle Roach. He had been for some years retired from the Irish Carabineers, and being still in the prime of life, he was thinking of again entering the army, when the incident which we are about to relate took place. He was a man of gentlemanlike accomplishments and manners, of a generous and friendly disposition, but marked by a keen and imperious sense of the deference due to a gentleman, and a heat of temper which was apt to make him commit actions of which he afterwards bitterly repented. After the unfortunate affair which ended his career in Scotland, the public, who never make nice distinctions as to the character of individuals, adopted the idea that he was as inhumane as rash, and he was reported to be an experienced duellist. But here he was greatly misrepresented. Mr Macrae would have shrunk from a deliberate act of cruelty; and the only connexion he had ever had with single combat was in the way of endeavouring to reconcile friends who had quarrelled, an object in which he was successful on several memorable occasions. But the same man, whom all that really knew him allowed to be a delightful companion and kind-hearted man, was liable to be transported beyond the bounds of reason by casual and trivial occurrences. A messenger of the law, having arrested the Rev. Mr Cunningham, brother of the Earl of Glencairn, for debt, as he was passing with a party from the drawing-room to the dining-room at Drumsheuch House, Mr Macrae threw the man over the stair. He was prompted to this act by indignation at the affront which he conceived his cousin as a gentleman had received from a common man. But, soon after, when it was represented to him that every other means of inducing Mr Cunningham to settle his debt had failed, and when he learned that the messenger had suffered severe injury, he went to him, made him a hearty apology, and agreed to pay three hundred guineas by way of compensation. He had himself allowed a debt due to a tailor to remain too long unpaid, and the consequence was that he received a summons for it before the Sheriff Court. With this document in his hand, he called, in a state of great excitement, upon his law-agent, to whom he began to read, "Archibald Cockburn of Cockpen, Sheriff-depute," &c., till he came to a passage which declared that "he, the said James Macrae, had been oft and diverse times desired and required," &c. "The greatest lie ever uttered!" he exclaimed. "He had never heard a word of it before; he would instantly go to the sheriff, and horsewhip him." The agent had at the time letters of *horning* against a very worthy baronet lying upon his table—that is to say, a document in which the baronet was denounced as a rebel to the king, according to a form of the law of Scotland, for failing to pay his debt. The agent took up this, and coolly began to read—"George the Third, by the grace of God," &c. &c. Macrae at once saw the application, and fell a-laughing at his own folly, saying he would go directly and give the sheriff tickets for the play at Marionville, which he and his family had requested. It will be seen that the fault of this unfortunate gentleman was heat of temper, not a savage disposition; but what fault can be more fatal than heat of temper?

Mr Macrae was married to an accomplished lady, Maria Cecilia Le Maitre, daughter of the Baroness Nolken, wife of the Swedish ambassador. They occasionally resided in Paris, with Mrs Macrae's relations, particularly with her cousin Madame de la Briche, whose private theatricals in her elegant house at the Marais were the models of those afterwards instituted at Marionville. It may not be unworthy of notice that, amongst their fellow-performers at Madame de la Briche's, was the celebrated Abbé Sieyes. When Mr Macrae and his lady set up their theatre at Marionville, they both took characters, he appearing to advantage in such parts as that of Dionysius in the *Grecian Daughter*, and she in the first line of female parts in genteel comedy. Sir David Kinloch and a Mr Justice were their best male associates; and the chief female performer, after Mrs Macrae herself, was Mrs Carruthers of Dormont, a daughter of the celebrated artist Paul Sandby. When all due deduction is made for the effects of complaisance, there seems to remain undoubted testimony that these performances involved no small amount of talent.

In Mr and Mrs Macrae's circle of visiting acquaintance, and frequent spectators of the Marionville theatricals, were Sir George Ramsay of Banff and his lady. Sir George had recently returned, with an addition to his fortune, from India, and was now settling himself down for the remainder of life in his native country. The writer of this narrative has seen original letters between the two families, showing that they lived on the most friendly terms, and entertained the highest esteem for each other. One written by Lady Ramsay to Mrs Macrae, from Sir George's country-seat in Forfarshire, commences thus—"My dear friend, I have just time to write you a few lines to say how much I long to hear from you, and to assure you how sincerely I love you." Her ladyship adds—"I am now enjoying rural retirement with Sir George, who is really so good and indulgent, that I am as happy as the gayest scenes could make me. He joins me in kind compliments to you and Mr Macrae," &c. How deplorable that social affections, which contribute so much to make life pass agreeably, should be liable to a wild upbreak from perhaps some trivial cause, not in itself worthy of a moment's regard, and only rendered of consequence by the sensitiveness of pride, and a deference to false and worldly maxims!

The source of the quarrel between Mr Macrae and Sir George was of a kind almost too mean and ridiculous to be spoken of. On the evening of the 7th April 1790, the former gentleman handed a lady out of the Edinburgh theatre, and endeavoured to get a chair for her in which she might be conveyed home. Seeing two men approaching through the crowd with one, he called to ask if it was disengaged, to which the men replied with a distinct affirmative. As Mr Macrae handed the lady forward to put her into it, a footman, in a violent manner, seized hold of one of the poles, and insisted that it was engaged for his mistress. The man seemed disordered by liquor, and it was afterwards distinctly made manifest that he was acting without the guidance of reason. His lady had gone home some time before, while he was out of the way; he was not aware of this, and, under a confused sense of duty, he was now eager to obtain a chair for her, but in reality had not bespoken that upon which he laid hold. Mr Macrae, annoyed at the man's pertinacity at such a moment, rapped him over the knuckles with a short cane, to make him give way; on which the servant called him a scoundrel, and gave him a push on the breast. Incensed overmuch by this conduct, Mr Macrae struck him smartly over the head with his cane, on which the man cried out worse than before, and moved off. Mr Macrae following him, repeated his blows two or three times, but only with that degree of force which he thought needful for a chastisement. In the meantime, the lady whom Mr Macrae had handed out, got into a different chair and was carried off. Some of the bystanders, seeing a gentleman beating a servant, cried shame, and showed a disposition to take part with the latter; but there were individuals present who had observed all the circumstances, and who felt very differently. One gentleman afterwards gave evidence that he had been insulted by the servant, at an earlier period of the evening, in precisely the same manner as Mr Macrae, and that the man's conduct had throughout been rude and insolent, a consequence apparently of drunkenness.

Learning that the servant was in the employment of Lady Ramsay, Mr Macrae came into town next day, full of anxiety to obviate any unpleasant impression which the incident might have made upon her mind. Meeting Sir George in the street, he expressed to him his concern on the subject, when Sir George said, lightly, that, the man being his lady's footman, he did not feel any concern in the matter. Mr Macrae then went to apologise to Lady Ramsay, whom he found sitting for her portrait in the lodgings of the young artist Raeburn, afterwards so highly distinguished. It has been said that he fell on his knees before the lady, to entreat her pardon for what he had done to her servant. Certainly, he left her with the impression that he had no reason to expect a quarrel between himself and Sir George on account of what had taken place.

James Merry—this was the servant's name—had been wounded in the head, but not severely. The injuries which he had sustained, though nothing can justify the violence which inflicted them, were only of such a nature as a few days of confinement would have healed. Such, indeed, was the express testimony given by his medical attendant, Mr Benjamin Bell. There was, however, a strong feeling amongst his class against Macrae, who was informed, in an anonymous letter, that a hundred and seven men-servants had agreed to have some revenge upon him. Merry himself had determined to institute legal proceedings against Mr Macrae, for the recovery of damages. A process was commenced, by the issue of a summons which Mr Macrae received on the 12th. Wounded to the quick by this procedure, and smarting under the insolence of the anonymous letter, Mr Macrae wrote next day a note to Sir George Ramsay, in which, addressing him without any term of friendly regard, he demanded that either Merry should drop the prosecution, or that his master should turn him off. Sir George temperately replied, "that he had only now heard of the prosecution for the first time; that the man met with no encouragement from him; and that he hoped that Mr Macrae, on further consideration, would not think it incumbent on him to interfere, especially as the man was at present far from being well."

On the same evening, Mr Amory a military friend

of Mr Macrae, called upon Sir George with a second note from that gentleman, once more insisting on the man being turned off, and stating that, in the event of his refusal, Mr Amory was empowered to communicate his opinion of his conduct. Sir George did refuse, on the plea that he had yet seen no good reason for his discharging the servant; and Mr Amory then said it was his duty to convey Mr Macrae's opinion, which was "that Sir George's conduct had not been that of a gentleman." Sir George then said that further conversation was unnecessary; all that remained was to agree upon a place of meeting. They met again that evening at a tavern, where Mr Amory informed Sir George that it was Mr Macrae's wish that they should meet properly attended next day at twelve o'clock, at Ward's Inn, on the borders of Musselburgh Links.

The parties met there accordingly, Mr Macrae being attended by Captain Amory, and Sir George Ramsay by Sir William Maxwell; Mr Benjamin Bell, the surgeon, being also of the party. Mr Macrae had brought an additional friend, a Captain Haig, to favour them with his advice, but not to act formally as a second. The two parties being in different rooms, Sir William Maxwell came into that occupied by Mr Macrae, and proposed that, if Mr Macrae would apologise for the intemperate style of his letters demanding the discharge of the servant, Sir George would grant his request, and the affair would end. Mr Macrae answered, that he would be most happy to comply with this proposal, if his friends thought it proper; but he must abide by their decision. The question being put to Captain Haig, he answered, in a deliberate manner, "It is altogether impossible; Sir George must in the first place turn off his servant, and Mr Macrae will then apologise." Hearing this speech, equally marked by wrong judgment and wrong feeling, Macrae, according to the testimony of Mr Bell, shed tears of anguish. The parties then walked to the beach, and took their places in the usual manner. On the word being given, Sir George took deliberate aim at Macrae, the neck of whose coat was grazed by his bullet. Macrae had, if his own solemn asseveration is to be believed, intended to fire in the air; but when he found Sir George aiming thus at his life, he altered his resolution, and brought his antagonist to the ground with a mortal wound in the body.

There was the usual consternation and unspeakable distress. Mr Macrae went up to Sir George, and "told him that he was sincerely afflicted at seeing him in that situation."* It was with difficulty, and only at the urgent request of Sir William Maxwell, that he could be induced to quit the field. Sir George lingered for two days. The event occasioned a great sensation in the public mind, and a very unfavourable view was generally taken of Mr Macrae's conduct. It was given out, that during a considerable interval, while in expectation of the duel taking place, he had practised pistol-shooting in his garden at a barber's block; and he was also said to have been provided with a pair of pistols of a singularly apt and deadly character; the truth being, that the interval was a brief one, his hand totally unskilled in shooting, and the pistols a bad brass-mounted pair, hastily furnished by Amory. We have Amory's testimony, that as they were pursuing their journey to another country, he was constantly bewailing the fate of Sir George Ramsay, remarking how unfortunate it was that he took so obstinate a view about the servant's case. The demand, he said, was one which he would have thought it necessary to comply with. He had asked Sir George nothing but what he would have done had it been his own case. This is so consonant with what appears otherwise respecting his character, that we cannot doubt it. It is only to be lamented that he should not have made the demand in terms more calculated to lead to compliance.

The death of an amiable man, under such deplorable circumstances, roused the most zealous vigilance on the part of the law authorities; but Mr Macrae and his second succeeded in reaching France. A summons was issued for his trial, but he was advised not to appear, and accordingly sentence of outlawry was passed against him. The servant's prosecution meanwhile went on, and was ultimately decided against Mr Macrae, although, on a cool perusal of the evidence on both sides, we see the clearest proof of Merry having been the first aggressor. Mr Macrae lived in France till the progress of the Revolution forced him to go to Altona. When time seemed to have a little softened matters against him, he took steps to ascertain if he could safely return to his native country. It was decided by counsel that he could not. They held that his case entirely wanted the extenuating circumstance which was necessary, of his having to contemplate degradation if he did not challenge. He was under no such danger; so that from his letters to Sir George Ramsay he appeared to have forced on the duel purely for revenge. He came to see the case in this light himself, and was obliged to make up his mind to perpetual self-banishment. He survived thirty years. A gentleman of our acquaintance, who had known him in early life in Scotland, was surprised to meet him one day in a Parisian coffee-house after the peace of 1814—the wreck or ghost of the handsome sprightly man he had once been. The comfort of his home, his country, and friends, the use of his talents to all these, had been lost, and himself obliged to lead the life of a condemned Cain, all through the one fault of a fiery temper. Reader, if thou shouldst ever feel thyself hurried by such a cause towards rash words and acts, however trivial, think on the fate of this unhappy man, pause, and be cool. Thou little knowest what may arise from a small ill-considered action. A rap over a servant's knuckles led to a scene of disgusting violence: four or five days after, a short imperious letter, beginning "Sir," brought two gentlemen to a field, where one fell in the prime of his days, and whence the other fled to be a remorseful and miserable exile for all the remainder of his life.

* Letter of Captain Amory, MS.

DOUGLAS JERROLD'S "CAKES AND ALE"

Is a merry little book, in two volumes, with plates by Cruikshank—a fair specimen of the light literature of our age—vivacious, superficial, somewhat extravagant, yet in the main well calculated to serve the end in view, namely, to amuse the passing hour. Mr Jerrold has a high London reputation as a writer of short pieces for the stage, and it is not therefore surprising to find the present prose sketches marked by a certain improbability of incident and situation which is not generally tolerated out of the drama; but, to make up for this, he has infused some remarks and moralisings of a kind for which his plays had not prepared us.

The difference between the professed and real practice of men in many domestic things may be every where observed, if we look narrowly. Most men, for instance, have a theoretical and practical hour of rising. Ask one when he usually gets up, and say he mentions seven. Take this as his theoretical hour, the hour at which he *wishes* to rise, thinks he *should* rise, and once in a twelvemonth *does* rise; but be sure that in reality he does not in general see much of the daylight world before eight. Say eight, again, is his professed or theoretical hour, it will be found that nine is the real one; and so on. Mr Jerrold has a penetrating eye for these discrepancies. Mr Pigeon is a young man a fortnight married. Coming home prematurely from Brighton, he determines to go out, leaving his young wife, the very first night—though he is "the same Pigeon whose landlady had given him for a character, as she thought, all the virtues of a household god. 'Pray, ma'am,' inquired Charlotte's busy maiden aunt, 'what are the habits of Mr Pigeon? He is about to marry into our family, and you'll pardon the question—what are his habits?' 'Habits!' replied the landlady; 'the woman's blessed who gets Mr Pigeon—gruel at ten, and bed at eleven.' And these moral proprieties, on the part of her future husband, were impressed upon the brain and heart of the bride by the aunt aforesaid. 'Gruel at ten, and bed at eleven!' reiterated the spinster; 'it seems little to speak of, child, but what a deal of happiness is ensured by the custom!' Mr Pigeon, assuring his wife that he would keep aloof from all acquaintance, took his hat. Mrs Pigeon looked at her lord with a mild mixture of matrimonial sorrow and anger. Can the female reader wonder at this? It was already half-past nine, and Mrs Pigeon sighed as she thought of her aunt; yea, she sighed deeply at the visionary happiness of—gruel at ten, and bed at eleven.

'All men,' said Susan [the servant], marking the melancholy of her mistress—'all men are alike, ma'am.'

'They are, Susan,' said Mrs Pigeon. 'Where's my handkerchief?"

Mr Pigeon is thus described on his way home at an early hour in the morning. "As the man crept homeward, there was culprit in his looks—in his hesitating pace. He had, it was true, fallen into a most delightful party—had been so happy, so very jolly; but now, alas! it wanted only seven-and-twenty minutes to six. What a beautiful morning!—yet what a reproach came with the bright sun! Sam blushed as he met the milkmaids; artisans passing to their work, made him turn his head away; the chimney-sweepers, crying their noisome trade, struck him compunctious; yea, the very sparrows, chirping and playing in his path, gave him a twitch of the conscience. Let not the reader think that Samuel Pigeon had any fear of the violence of his ill-used spouse; no, she would only weep—for she was a young wife, and had not yet come to her nails. It was a nobler feeling that possessed Pigeon—not base dread, but bitter repentance. He had been beguiled into cards—had, moreover, been very lucky—but what was luck at nearly six in the morning! He had held the most wonderful hands at loo, and had never played but when justified by both king and queen. And then he thought, and in the dissatisfaction of his soul almost gave vent to the words—'Tis six in the morning—my wife is sitting up—and, compared to domestic peace, oh! what are trumps?'

Pigeon, with heavy legs, walks on; and now he approaches his door. He scrapes his shoes as tenderly as though he scraped his bare feet; he wants to cough, but he hasn't sufficient nerve to risk the operation. He looks at his knocker; the lion's head ornamenting it seems to stare with new ferocity upon him. He touches the knocker as if it were red-hot—shakes it spasmodically—tap, tap, tap—and to Pigeon the sound seems to search through a dead, deserted house—a desolate homestead. Has Charlotte gone to her family? Or, anticipating the completion of a threat to be made in after-life, has she already taken a lodging? Strange thoughts chill the heart of Pigeon, as he stands pricking his ears at his own inhospitable door."

To the same effect is the following "bit:"—"Young Brown inherited from his father the equivocal sum of a thousand pounds. He had better inherited nothing; for, in the present state of society, we hold a thousand pounds to be not merely a useless but a mischievous sum: it is not a negative good, but a positive evil. What is to be done with a thousand pounds? Put it in the funds, says Quiet, and philosophise upon thirty pounds a-year! There are exquisite essays written to prove the sufficiency of thirty pounds a-year, allowing at least five shillings per quarter for the conversion of the Jews; essays, in which the expenses of a pauper gentleman are so nicely calculated, that it must be his own wilful eccentricity if, at the end of the year, he either owes a shilling or has one. We happen to be honoured with the short acquaintance of the author of some of these *libretti*. He had thrice been shut up in the Fleet on an income of three hundred per annum, and was consequently enabled to preach on the competence of thirty pounds a-year. It was during his third visit to the jail that we had some interesting talk with him. He was lamenting the extravagance of the present generation; and passing his right hand under his velvet cap, and turning his pensive and eloquent eye upwards, asked us if we had ever read his book. Of course we had. We, however, ventured to question the correctness of its conclusions; in a word, we were hardy enough to express our doubts of the possibility of existing 'as a gentleman'—for such were the author's premises—on thirty pounds a-year. 'Look at Higgingbottom,' said we; 'he has followed your system to a chop, and yet Higgingbottom is in debt.' 'Pardon me,' quickly returned the author, 'I grant his obedience so far as the chop goes, but there were three days in the year that Higgingbottom would not take his chops without pickles. Now, my system is so philosophically arranged, as not to admit even of a single onion. Depend upon it, my dear sir, with a wise economy, a man may always on thirty pounds a-year obtain his chop; the ruin lies in the pickles.' We were about to dispute the point, when the temperate author began to swear at a boy who entered with a bottle of port. 'And where, you scoundrel,' cried the author of a treatise on the sufficiency of thirty pounds per year—'where, you miscreant, are the olives? What! forgot them? Vagabond! to suppose I could drink port without olives! Vanish! Stop! Don't make the blunder you made before—mind, *French* olives!'" These neat pieces of philosophy, slashed into Mr Jerrold's stories, speak for themselves. Alas for the illusoriness of all human professions, and the infirmity of all human resolutions!

Passing from these matters, we are reminded of the fine allegorical writing of the Elizabethans by such passages as the following, which relates to the anticipations of Mr Silvertop, an author on the point of finishing a great metaphysical work:—"In another month, he would no longer creep along the streets, accompanied by Desert, a pretty fellow, yet withal a timid, blushing, stammering knave, content to slink with him he waits upon, down dismal alleys, over barren heaths, at length, it may be, conducting his master to a dry ditch for his bed, and to wild cresses and water for his breakfast—a trick the varlet hath often put upon brave spirits—but, in his place, that swaggering, brow-beating, gold-laced lacquey, Success, would clear the way for Silvertop, would strike off the hats of the mob, content to be so unbonneted, seeing that Success—oh! the magic of his name upon the world, hath willed it—nor ever ask whence comes he—what's his value? No matter for his birthplace, his parentage; Success has all-in-all in his name. Though he were born on the wayside, his mother a gipsy, and his father a clipper of coin—for his name, and name alone, men shall bow down and worship him. Desert weeps at the early grave of the broken-hearted; Success eats ortolans with a quacksalver at threescore. Men may certainly be brought to allow the possible existence of unrewarded Desert, but for Success, there can be no doubt of its vitality; he is seen, known, touched; nay, sometimes men dine with him."

How well, too, are some modern follies touched upon in the following description of the visit of a great foreigner to an ancient English borough:—"The church bells rang in the happy day; shops were closed; every man, woman, and child, in their best clothes, and with their blithest looks; fifty maidens scattered roses in the path of the magnificent stranger, and a thousand voices rent the sky, at the first glimpse of his right royal beard. The Spaniard alighted at the mansion-house, and though he spoke not a word of English, expressed himself enraptured with his reception. At which Tobias Aconite placed his hand upon his heart, and upon his honour declared that day to be the very happiest of his whole existence. The Spaniard and his followers having partaken of a slight repast of brawn, brown bread, and ale—a public-spirited economical townsman calculated that each man consumed a pound and a half of meat, a two-penny loaf, and two quarts of liquor—were conducted by the mayor and other authorities to inspect the public works and buildings of Hole-cum-Corner. Thus moving in slow procession down Prigapple Lane, the Spaniard was shown the stocks; at which curious instance of man's ingenuity he expressed his most intense delight. He was continually heard to murmur

as to himself, 'Great English! wonderful people!' a truth translated by the schoolmaster of Hole-cum-Corner; who, in his childhood wrecked off Cadiz, had served three years as turnspit in the most Holy Inquisition. Having duly inspected the stocks, the Spaniard was conducted two miles out of the town, to Hempseed Common, to view an antique gibbet, one of the highly-prized, most sacred, and most venerable institutions of Hole-cum-Corner. Here, again, he exclaimed, 'Great English! wonderful people!' Returning to the town, the illustrious visiter was conducted to the cake-manufactory, where was exhibited to him the whole process of cake-making; at which, as before, he declared himself sufficiently astonished, and biting a cake hot from the oven, again exclaimed, 'Great English! wonderful people!'

The royal Spaniard was, after this, shown over the vast establishment of Squint and Leer, inventors and makers of dolls'-eyes. Here a most gratifying surprise awaited the royal guest, for he was presented, not only with the freedom of the town, in a handsome pearl box, but with a document that enabled him to set up as dolls'-eyes maker in any part of England; a privilege which he declared to be the most flattering mark of national liberality and national affection. He avowed that, in the whole course of his life, he would never look into the eyes of a doll, without thinking of the worthy people of Hole-cum-Corner."

The "Preacher Parrot" is a happy and original idea of our author. The bird in question has been brought up in an auction mart, where it has picked up a great number of the phrases of the place. Afterwards transferred to various owners, it loses the favour of all in succession by its too apropos repetition of the auctioneers' slang. The following is a specimen of its adventures:—"A very select party was congregated at the house of Mrs Limetwig, to celebrate the birth-day of her daughter, the youngest of four, the fair Belinda, who, at the time we write, had entered into her nineteenth year; and although she had no fortune—at least, what is vulgarly understood by the mercenary young men of our day as fortune—she had the nobler kind of wealth in great abundance—she was accomplished to the verge of perfection. Her pine-apples painted on white satin, were equal, if not superior, to any in Covent Garden. And then her portraits of dear and particular friends—they lived and looked! It was only known to a few, but she had contributed some of the fancy heads, to either the Bloomsbury or the Bagnigge Wells Beauties, we forget which. Her modesty withheld her name; but they who had seen one of her faces, could easily point out the whole gallery. They had all the same sweet small mouth; in which the artist finely indicated the ethereal nature of the heroine, showing that with such a mouth it was impossible to eat. A mouth—if we may dare even to approach a masculine simile—almost the size of a shirt-button-hole; indeed, when any of the teeth were seen, it might almost be doubted if they were not the pearl button itself. And then the Dian-like purity illustrated in such little lips!—they might, with difficulty, compass a whistle, but could never be brought to perpetrate a kiss. The eyes were worthy of the lips; nice little beads, looking up in one head and down in another, as, in obedience to a wire, we see the different orbs of different dolls. And then the flesh and the general expression of the face—so soft, so very sweet, so unlike the flesh that, on this dull earth, is wooed and won and taken before a parson: no, it is clear such beauties live upon honey-dew like humming-birds—on conserves of roses, and jessamine paste. They are a great improvement to the ideal woman of Wordsworth, and are

> —— 'much too good
> For human nature's daily food.'

It may be thought that we have lingered too long on the one ability of Belinda, seeing that she has so many; but we could not for the life of us let the reader pass in ignorance of the fair hand so successfully helping the advancement of high British art. We have paused—many a time have we paused—before these heads, contemplating them with the same profound sense of the beautiful, that in our schoolboy days we have lavished upon sugar-plums; nay, it may be wrong to own the weakness, but, perhaps, with the self-same wish. To return to the birth-day party.

We never see a young lady, surrounded by eight or ten bachelors, take off her gloves, and seat herself at the piano, but we shudder, from an association of ideas—yes, we instantly think of the infernal machine! Who knows how many men may be killed dead on the spot by the first crash! Belinda played divinely. Edgar Flimsy, the younger son of a country banker, looked very serious as the music proceeded. Mrs Limetwig observed the gravity of the young gentleman, and, doubtless to divert it, desired Belinda to sing. Belinda obeyed, and sang in the finest possible taste. Had she been wound up for the occasion like a musical snuff-box, she could not have acquitted herself with more precision, and with less vulgar impulse: every note fell from her lips as if it were chiselled—and then her execution! Poor Edgar Flimsy!—his heart was dragged up and down the gamut until exhausted; when, at the last three-minute shake of the songstress, it fell into a thousand little pieces. Indeed, we would not own the heart that could stand that shake. There was a general burst of applause, followed for a moment by a profound silence. Mrs Limetwig looked proudly at the young bachelors, but favoured the younger son of the banker with a look entirely for himself.

In this pause, a voice cried out, and it seemed as if accompanying the glances of Mrs Limetwig—'*Does nobody offer?*'

A titter, deepening into a laugh, went round the room, and Mrs Limetwig and Belinda turned to scarlet. 'Oh—ha! ha!' observed the mamma, evidently restraining excessive laughter; 'that teazing bird, which William's godfather brought him—how came it here?' and the servant was immediately ordered to secure the intruder. But the parrot was a social parrot, and resolved not to leave the party; hence, after many ineffectual attempts to catch it, for its leg, though weak, had been set by some Samaritan, the bird was suffered to remain.

'It was downright cruelty to ask, but would'—thus spoke the banker's younger son—'would Miss Limetwig sing his favourite song—the' ——

'Certainly,' answered Mrs Limetwig for her daughter; and the favourite song—we forget its title and words, but its being very popular may account for that—was executed with incomparable power.

'Your only unmarried daughter?' observed the banker's son, in a low voice, to Mrs Limetwig.

'All married, except my dear Belinda; and it would break my heart, I believe, to part with her. Yes, sir,' said the mother, affected even by the probability of a separation; 'Belinda, sir, is—is' ——

'*The last lot, gentlemen—the last lot!*' cried the parrot; and the guests burst into uncontrolled laughter. Belinda, with fine presence of mind, immediately struck the keys of the piano, as though quite unconscious of the interruption, and in a minute or two was in the midst of a furious battle-piece.

'If I might aspire to the notice of Miss Limetwig,' said the banker's son to the mother, 'I hope that' —

'*Going for a song, gentlemen!*' cried the parrot; and again its words were greeted with a shout. 'It was too much; the creature—where could it have learned such words?—should be sent from the house.' Such was the sentence pronounced by Mrs Limetwig, and after some little difficulty carried into execution. But the charm of the night was broken: Mrs Limetwig was irritated, Belinda languid, and the banker's son—whether the last declaration of the bird had 'given him pause,' we know not—not once, for the remainder of the evening, ventured to speak of Belinda. She died a maid, a victim to the intrusion of truth.

What would become of the world, if truth interfered in every marriage?"

THE BOTHY SYSTEM.

A BOTHY is a rude barrack, or place of lodging, for farm-servants, where they are kept very much on the principle that a gentleman keeps his hounds—a roof over their head, a few of the meanest articles of furniture, and no kind of moral superintendence. In former times, it was customary for agriculturists and those in their employment to live under the same roof, and the habitual and familiar intercourse in and out of doors produced ties of friendship. The one party, at least, took an interest in the welfare of the other; and if there was homeliness of manner, there was at the same time propriety of behaviour. The master found himself under the necessity of setting an example, and the servants felt that to forfeit esteem was to lose their means of existence. Thus, the action and reaction of opinion kept all right. In these times, however, all the servants of the establishment did not live under the roof of their employer. Married ploughmen lived in a cottage somewhere on the land, and their families, on occasions, lent assistance in field labour, herding cattle, or, as Burns says, "running an errand to a neebour toun."

A time came when all these old-world practices were blown up. The demand for agricultural produce, consequent on the French war and other circumstances, excited a spirit of improvement in husbandry, which has, in the space of forty years, about as effectually changed the face of Scotland as if the old country had been carried away and a new one set down in its stead. There is now scarcely such a thing as a thatched farm-house of the old fashion. The farm-houses are good slated buildings; the farmer lives in a style better than a landed gentleman half a century ago, paying, at the same time, ten times the old rent; and in several quarters of the country, all the operations connected with the farm are executed by young unmarried men, hired for short terms, and who are usually lodged in a *bothy*. In some districts, the practice of employing only unmarried men has not yet been introduced; and in such cases, the ploughmen with their families reside in cottages near the homestead, a practice which it is a pity should ever be broken up.

The reader will now understand what is meant by the *bothy system*, which, from whatever cause, we are assured is effecting a serious demoralisation of manners among the peasantry in all the places in which it has taken root. The evil, it appears, has attracted the attention of those philanthropists who take pains to look below the surface of things; and the Highland Society has, we observe, lately given a premium to the writer of an essay on the subject. As readers in the south may be interested in knowing the *mechanique* of a bothy, we can tell them something of it from the account which we have just alluded to. First, of the inmates: they are all unmarried men; their salary, individually, is from L.10 to L.12 per annum, paid in money. Besides this allowance, they have each two pecks of oatmeal weekly, nearly two quarts of milk per day, or an equivalent in small beer or money; and frequently a quantity of potatoes during the winter half year. Next, for their lodgment: they are provided with an out-house connected with the farm-offices, which contains a few rough stools, benches, or chairs, sometimes a table, a pot for boiling water in, fuel, either of wood or coal, salt, light, and a few small articles, which usually belong to the ploughmen themselves, such as a small chest for holding meal, a wooden or tin bowl, and a horn spoon. The place is provided with beds, consisting of common frames, ticks stuffed with chaff, blankets, and coarse linen sheets. Sometimes the sleeping place is not in the bothy, but in a room adjoining the stable. The inmates cook their own victuals—in plainer terms, make their own porridge—make their own beds, and perform other offices for themselves. The bothy establishment is under no other jurisdiction than that organised by its own inhabitants, and that is as lax as may be. There is no privacy; and a virtuously disposed individual has no chance of escape from his comrades. A farmer, who has had the courage to expose the system in a well-written essay on the subject, declares that the corruption of manners is complete; for, says he, "should any of the inmates of the bothy be disposed to rational enjoyment, they are most probably exposed to the interruption of noisy ribaldry and unbecoming behaviour, which disturb all composure, or all commendable social intercourse. I have witnessed his evil on my own premises. I have had, of late years, several single men-servants from a district of country where there are few bothies. At first, they read in their spare hours; and some contributed towards procuring a newspaper and periodical work for themselves, besides having the use of mine. The interruptions of the old bothy inmates, however, soon altered their habits. They first gave over *paying* for a paper of their own, and latterly declined to read one, except on rare occasions, afforded to them *gratis*; and they gradually became very consistent bothy-men. They professed to regret this, but alleged they were obliged to yield to the circumstances under which they were placed. Indeed, I am persuaded the minority would find it impossible to alter the nature of bothy characteristics, or even to follow the superior bent of their own minds. One thoughtless or mischievous associate is much more likely to become a leader in a bothy than one of an opposite character. The present situation of unmarried farm-servants cannot, therefore, in the very nature of things, conduce to any other result than that which we have contemplated; and while they continue to be so situated, the same elements of corruption, produced by like exciting causes, will assuredly mingle their bitter fruits with the devoted community."

Speaking of the habits acquired under this vicious system, the same writer observes, that intemperance is not the least common. "They frequently either purchase whisky, and use it in their bothies on high occasions, or resort in a body to the public-house, where they seldom fail to indulge beyond their physical capabilities. These debauches, especially when committed in their own dwellings, are followed by language the very excess of ribaldry, and by conduct resembling that of a tribe of savages; and as these extraordinary revels last throughout the greater portion of the night, besides all other personal sacrifices and injuries, the want of proper rest incapacitates the misguided and infatuated victims for the work of the succeeding day. While they were inmates of the farm-house, they could not absent themselves without discovery, far less keep a bottle for the use of themselves and friends in the manner described. Now, they may do both. They can go wherever, or do whatever, they please, provided they are at their work in working hours, however indisposed or unprepared for its execution. The temptations and opportunities to indulge in intemperance have not *yet* made many servants *habitual* drunkards. They exceed only occasionally, when urged by the contaminating system of association. But at both terms of the year many of them give full license to their depraved appetites. A great proportion of them expend their hard-earned means, on these occasions, most profusely and recklessly. From the period of leaving their old service and entering on their new, being generally every half year, the average expenditure of each unmarried man-servant, on intoxicating liquors and other evil indulgences, cannot be less than ten or fifteen shillings. Some of them expend one or two pounds, thus wasting nearly the half of their wages. The poverty produced by these short-lived seasons of revelry, is the best safeguard against their repeating acts of the same description until the wages are again won, to be expended in a similar manner. This regular routine of inebriety seldom gets a check until the victims are overwhelmed by debt. The money that went into the pocket of 'mine host,' ought to have gone to pay the shoemaker and tailor. Indeed, so unguarded and indiscreet are bothy servants in general in their expenditure, that they have often to purchase their necessaries on credit. Few are able to pay in ready money, and their wages, even before they are earned, are consequently almost all uplifted, or pledged, for a portion of both necessaries and indulgences; and as they are continually changing their situations, some of them *omit* to give a

parting call to their creditors. This improvident and dishonest conduct destroys in them every honourable feeling, and forms a barrier to the cultivation of habits of economy in after life. * * * *

The reader can judge from these facts, why many rural female-servants have become so depraved in their habits, and inefficient in the discharge of their duties; and, moreover, how little they are qualified to be wives and mothers, and what kind of promise their offspring hold out for the future cultivators of the soil. The labourers are not the only sufferers from this depth of degeneracy into which they are plunged, and are plunging, it is to be feared, still deeper and deeper. Their masters' interests and comforts are materially involved. They are wanting in their duty to themselves, and they cannot be dutiful to others. Many of them, being totally regardless of the interests of their employers, become mere eye-servants; and all the strictness with which they are watched cannot ensure the efficient performance of their duty."

We must have done with this odious picture of rural depravity. Having brought the subject fairly under public attention, we leave it to the consideration of those who have it in their power to carry practical remedies into effect.

GLASS WAISTCOATS.

The very ingenious discovery of working glass into a substance resembling the richest silk, is now being brought into very general operation, and in various ways, such as gentlemen's waistcoats and stocks, ladies' dresses, and many other articles of decoration, in the most splendid patterns. It is superior even to silk in flexibility and softness, and the durability of it (a point, however, of no consideration with the *haut ton*, among whom at present it exclusively is), as a matter of course, vastly superior. In process of time, when the manufacture has arrived at a more perfect state, and all its little defects remedied, and its wastings discovered, it will in all probability come within the reach of most classes of society, but at present its cost is its only drawback. The magnificence of its appearance is quite remarkable, and when used in any considerable quantity, such as window-curtains, &c., it should be seen before a just appreciation of its richness and elegance can be entertained.—*Newspaper paragraph.*

CONDUCT BEFORE THE KING AND QUEEN.

In the first place, you must not cough. If you find a cough tickling in your throat, you must arrest it from making any sound; if you find yourself choking with the forbearance, you must choke—but not cough. In the second place, you must not sneeze. If you have a vehement cold, you must take no notice of it: if your nose-membranes feel a great irritation, you must hold your breath; if a sneeze still insists upon making its way, you must oppose it, by keeping your teeth grinding together; if the violence of the repulse breaks some blood-vessel, you must break the blood-vessel—but not sneeze. In the third place, you must not, upon any account, stir either hand or foot. If by chance a black pin runs into your head, you must not take it out. If the pain is very great, you must be sure to bear it without-wincing; if it brings the tears into your eyes, you must not wipe them off; if they give you a tingling by running down your cheeks, you must look as if nothing was the matter. If the blood should gush from your head, by means of the black pin, you must let it gush; if you are uneasy to think of making such a blurred appearance, you must be uneasy, but you must say nothing about it. If, however, the agony is very great, you may privately bite the inside of your cheek, or of your lips, for a little relief; taking care, meanwhile, to do it so cautiously as to make no apparent dent outwardly. And, with that precaution, if you even gnaw a piece out, it will not be minded, only be sure either to swallow it, or commit it to a corner of the inside of your mouth till they are gone—for you must not spit. I have many other directions, but no more paper; I will endeavour, however, to have them ready for you in time. Perhaps, meanwhile, you would be glad to know if I have myself had opportunity to put in practice these receipts?—*Madame D'Arblay's Diary.*

QUACKERY.

Quackery, like sin, is very ancient. It flourished in ancient Rome as well as in modern Europe. Nor does it depend for its prosperity on the ignorance of the uneducated classes. "The desire of wealth and health," says Pitt, "seems to put all understandings on a level: the avaricious are duped by every bubble—the lame and unhealthy by every quack." The faith of that singular compound of folly and knavery, the world, is kept up by peers, judges, and bishops, by clowns, operatives, and old women, who furnish certificates to the value of nostrums, and testify in favour of imposture, delusion, and villany. Every material substance and medicament, from the inert herb and common weed to simple water, having no properties beyond mere matter, have been at one period or another boasted up to the vain and empty nothingness of a great name, as the best remedy in the world for the inward bruises of all mankind. Indeed, each has possessed in turn the same reputation, and produced the same imputed benefits as a panacea for the cure of every disease under the sun; and their imaginary virtues have been witnessed and attested by persons from the throne to the garret. In this country the sale of quack medicines has kept pace with the "march of intellect." Forty years ago they yielded an annual revenue to the state of about L.14,000. In 1841 the amount realised was L.50,000. For the last half century, English governments have looked upon this vile revenue as more valuable, in their judgment, than the health of the people, the prosperity of the regular profession, and the improvement of physic. "They manage these things better in France." There the compositions of all nostrums are divulged, compulsorily, to the Academy of Medicine; after which a license is given for the sale of them, if they are not injurious to the public health. The sale of hurtful nostrums is prohibited by penalties. As to other nostrums, the quack may sell, the dupe may buy—the government only interfering with "the liberty of the subject" (whether that subject be quack or dupe) for the protection of life.—*Abridged from a Paper by Dr Fosbroke of Chester.*

LINES ON REVISITING THE COUNTRY.

[BY BRYANT, AN AMERICAN POET.]

I STAND upon my native hills again,
Broad, round, and green, that in the southern sky,
With garniture of waving grass and grain,
Orchards and beechen forests, basking lie;
While deep the sunless glens are scooped between,
Where brawl o'er shallow beds the streams unseen.

A lisping voice and glancing eyes are near,
And ever-restless steps of one, who now
Gathers the blossoms of her fourth bright year;
There plays a gladness o'er her fair young brow,
As breaks the varied scene upon her sight,
Upheaved, and spread in verdure and in light.

For I have taught her, with delighted eye,
To gaze upon the mountains—to behold,
With deep affection, the pure, ample sky,
And clouds along the blue abysses roll'd—
To love the song of waters, and to hear
The melody of winds with charmed ear.

Here I have 'scaped the city's stifling heat,
Its horrid sounds, and its polluted air;
And—where the season's milder fervours beat,
And gales, that sweep the forest borders, bear
The song of bird and sound of running stream—
Have come awhile to wander and to dream.

Ay, flame thy fiercest, sun; thou canst not wake,
In this pure air, the plague that walks unseen;
The maize leaf and the maple bough but take
From thy fierce heats a deeper, glossier green;
The mountain wind, that faints not in thy ray,
Sweeps the blue steams of pestilence away.

The mountain wind—most spiritual thing of all
The wide earth knows—when, in the sultry time,
He stoops him from his vast cerulean hall,
He seems the breath of a celestial clime—
As if from Heaven's wide open gates did flow
Health and refreshment on the world below.

—*Selections from American Poets.*

TEMPERANCE IN IRELAND.

ON this subject it affords us much pleasure to give the following letter (extracted from a newspaper) by Miss Edgeworth, dated "Edgeworthstown, Feb. 28, 1842," to R. Allen, Esq., Secretary of the Irish Temperance Union, Dublin:—

"Sir,—Your letter needs no apology. I thank you for having thought it worth while to apply to me, and for desiring to have my opinion on the Temperance Association, along with those of the most benevolent and enlightened friends of humanity.

I am happy to be able—by all the experience we have had in this neighbourhood, and by all that I have heard of evidence from different parts of the country—to confirm the accounts you have from all parts of Britain, and especially from Mr Clarkson—'the venerable Clarkson,' as you justly call him. I should content myself with saying—as once a gentleman did after hearing a speech of Burke's—'I say ditto to Mr Burke,'—I say ditto to Mr Clarkson—but that I think it may be useful to this good cause, that all should give specific individual evidence of what they know of their own knowledge of the operation of this temperance pledge.

In our village of Edgeworthstown, the whisky-selling has diminished, since the pledge has been taken, within the last two years, so as to leave public houses empty, and to oblige the landlord to lower house-rent considerably. This we know to our pecuniary loss—I need not add, to our moral satisfaction.

The appearance of the people—their quiet demeanour at markets and fairs—has wonderfully improved in general; and to the knowledge of this family, many notorious drinkers, and some, as it was thought, confirmed drunkards, have been completely reformed by taking the pledge.

They have become able and willing to work, and to take care of their farms and business—are decently clothed, and healthy and happy—and now make their wives and children happy, instead, as before the reformation, miserable and broken-hearted. I have heard some of the strong expressions of delight of several of the wives of the reformed drunkards. One wife said to me, 'Ma'am, I'm the happiest woman now that can be; sure, *he* says he is wakened from a dream, and now *he* goes about his business so well; and, ma'am, he can eat more, and he can bear the noise of the children, which he never could formerly.'

I have heard of many instances where the health has been improved, even where the 'total abstinence' began late in life, and after habits of daily intemperance.

I have not *known* of any in which the health has suffered. Very few instances of breaking the pledge have as yet come to our knowledge in this neighbourhood, but some have occurred. The culprits have been completely shunned and disgraced, so that they are awful warnings to others.

So long as public opinion is upheld in this manner, and so continues to act, we may hope that this great power—this inestimable moral blessing to Ireland, in particular, will continue; and most earnestly I hope and pray that it may.

Beyond all calculations—beyond all the predictions of experience, and all the examples *from the past*, and all analogy, this wonderful crusade against the bad habits of nations—the bad habits and sensual tastes of individuals—has succeeded and lasted for above two years.

It is amazing, and proves the power of moral and religious influence and motive, beyond any other example on record in history.

I consider Father Mathew as the greatest benefactor to his country—the most true friend to Irishmen and to Ireland.—I am, sir, with the most earnest wish for the continued success of your great cause, yours truly,

MARIA EDGEWORTH."

FRENCH IDEAS OF ENGLISH SPORT.

After horses, greyhounds, foxes, pigeons, and bull-dogs, we at length come to boxers—the last class of sport, which holds brutes in greater esteem than men; for do not fancy that this classification is the effect of chance, and of a sense of shame or disgust. Not so; the English do nothing without an intention; they never blush at what they do, and are enraptured with delight at the hideous sight of two desperate boxers. Thus the last rank allotted in the hierarchy of sport to those ignoble fights, proves only, that if they tremble when their horse has caught a cold, they have somewhat less feeling when they behold a man's ribs knocked in. In those combats every thing is opprobrious and repulsive—ay, every thing, from the teethless mouth and the brutal looks of those degraded beings, to the preparations and precautions destined to prolong the combat. Each second brings his champion a pail of water, a large horse sponge, and a bottle of brandy or wine. The heroes are stripped to the waist, and, at first, totter, as much from fear as from drunkenness; but the murmurs of the spectators soon warn them that they have not come to witness mere childish play. Vanity then prevails over fear, and the combat becomes serious. At every tooth that drops, at every rib that breaks, at every eye that falls out, there are voices that shout "Bravo!" and hands that applaud. The struggle has already lasted an hour; the boxers are exhausted; they can scarcely stand; their faces are bruised, and covered with blood; their bodies present but a huge sore. But they have not yet rested and assailed one another above fifty times, and a proper combat must be renewed at least sixty or seventy. Their seconds apply the sponge to the flowing blood, wash their eyes, noses, and ears, pour wine or brandy down their throats; and the blows resound again, until one of them, panting, exhausted, almost dead, falls down to get up no more. And yet the crowd is often dissatisfied; often does it cry that there has been treachery or cowardice—instead of one corpse it would have two. This is the ugly side of sport in England, for it is not the populace only that encourage these loathsome spectacles; the most elegant men blush not to witness them, and to speculate upon the fists of a boxer with the same coolness as they speculate upon a horse's legs. In this department of sport we shall never be on a level with the English, and we can but congratulate ourselves upon it. —*La Presse.*

EDITORIAL NOTE.

THE Editors of CHAMBERS'S EDINBURGH JOURNAL again beg to intimate that they do not wish any contributions, and that they will not be responsible for the safe-keeping or the return of papers pressed upon them notwithstanding these repeated announcements. They also would respectfully submit, that it is too much to expect them to attend to or answer all the letters sent to them. The greater proportion of these communications are inquiries on subjects which the writers themselves, by a small share of industry, could easily settle to their own satisfaction. At all events, the Editors have such onerous duties to perform to the public, in the conducting of the present and the other works on which they are engaged, that to attend to the many inquiries put to them is entirely out of the question. Some may be inclined to think this uncourteous; a knowledge of the facts would show that such was not the case. Many of these correspondents seem not to have the slightest notion that they are giving trouble, or that they have not established a claim to be answered to the full extent of their demands. Were the Editors to publish some of their letters, they would form an amusing farrago of conceit, spite, and folly. The class of persons whom a statesman described as bothering him with advices to tax pianos and umbrellas, are a type of these letter-writers. One sends a long, ill-spelled communication respecting the millenium, which, he says, from a peculiar combination of certain letters of the alphabet and certain figures, is proved will take place in the present year—he is anxious to know if his calculations are correct. A second has discovered the perpetual motion, "and could make watches go by the same power that governs the motions of the planets"—the Editors are to be rewarded with half the profits if they will be at the expense of taking out a patent for the discovery. A third is a person residing in England, who thinks he is somehow related to a family of distinction and wealth in the north—he requests to be furnished with a private history of the said family for two centuries back; —expenses of search will be cheerfully paid. A fourth is most anxious to discover the origin of his name, and will go the length of half a guinea to be satisfied on the subject. Not a few ask a candid opinion on the merits of parcels of poetry (!) which they enclose for perusal. But, as above mentioned, the greater proportion ask answers to questions of the most trifling nature. At least six persons have asked why the pages of the "Information for the People" are not numbered, any one of whom might have seen that the pages *are* numbered—the only peculiarity being that the figures are placed at the bottom instead of the top of the page. Perhaps a dozen persons have asked to be furnished with the address of Dr Turnbull in London, although it is expressly mentioned in the article referring to that gentleman that he lives in Russel Square; and surely it could not be *very* difficult for an inquirer to find out all the rest himself; some people, however, never seem to be able to do any thing for themselves—they always require somebody to lead them or push them on. Once for all, the Editors do *not* know any thing more of Dr Turnbull's address than that it is—Russel Square, London. London is a large city in England, and may be reached by stage-coaches, railways, or steam-boats. On arrival, a good plan would be to hire a street *cab* (contraction of cabriolet), and tell the cabman to drive to Dr Turnbull's, Russel Square; and leave him to find out the house, which there is little fear of his doing. It is hoped this will be considered sufficiently explicit.

The Editors, in conclusion, have a more pleasing duty to perform in thanking many kind friends for their obliging hints, observations, and corrections of errors, which they indulgently and properly ascribe to inadvertency. In all cases in which the errors are not imaginary but real, care is taken to correct them in subsequent impressions.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 535. SATURDAY, APRIL 30, 1842. PRICE 1½d.

SHORT NOTES ON MATRIMONY.

MATRIMONY has never been treated formally in the Journal, but several matters connected with it have received some attention. In an early number, in a paper entitled "Fathers have Flinty Hearts," we endeavoured to combat the idea that parents are in general animated by views opposed to the happiness of their children with regard to marriage.* Afterwards, under the title of "Attachments,"† it was our aim to show that that fixing of the affections upon one object, which the young generally consider as an act, like certain advertisements, "not to be repeated," is in reality only the employment of a *power* of affection, which, on some subsequent occasion, and under certain favouring circumstances, may be shifted to a second object, which it will regard with as strong a feeling of preference as it ever manifested for the first. We afterwards said what we could to discountenance the dangerous practice of making engagements when there is any thing but the most immediate prospect of their being fulfilled by marriage—a practice which leads to a vast amount of misery otherwise avoidable, and which every one possessing the slightest influence over young persons, ought by all means to discourage.‡ The different but even more alarming class of dangers attending marriage between parties nearly related in blood, was the subject of another paper.§ More recently, we took into consideration the common notion as to the dependence of women upon marriage, and endeavoured to show that their respectability and happiness might be advanced by their appearing and really considering themselves as comparatively independent of matrimony; for which reason we counselled parents to train up their female children to look upon a husband as a thing which it was only well to have, if a good one should readily occur, but which it were better otherwise to want, or for which, at least, no sacrifice should be made, seeing that it is quite possible to lead both an useful and a happy life unmarried.‖ We would now advert to a few other points connected with this subject—a delicate one, we confess, seeing that every error involved in it has been committed by the wisest and most estimable of our friends, but which we shall nevertheless venture on, with some hope of passing over it successfully, being, on this as on all other occasions, sincerely anxious to treat general questions with as little offence to the feelings of individuals as possible.

It is but to reiterate the most commonplace observation, that unequal matches of all kinds are unfavourable to happiness. A match may be unequal in age, in the personal appearance and manners of the parties, in their original grade, and many other respects. In every respect inequality is mischievous, and generally as much so for the party who seems to have the advantage, as for the other. When, for instance, a female of thirty-five marries a man of twenty, the likelihood of unhappiness ten or twelve years afterwards, is even greater for herself than for her husband. The laws of nature have in this case been signally violated, and nothing but evil can follow. The ages of married pairs should be adjusted according to a sliding scale, in something like the following manner:—When the woman is under twenty-five, the man should not be less than five years older; when she is between twenty-five and thirty-three, he ought to be eight years older; when she is between thirty-three and forty, he should be fully fifteen years her senior; and so on. It may be observed that departures from such a rule are not certain in all cases to be attended with unhappiness; but assuredly, in as far as it is departed from, there is the less *likelihood* of happiness. So, also, when an individual of a humble grade is adopted by marriage into a comparatively refined circle, there is, upon the whole, most risk of suffering to the inferior person. It is not good for either, but certainly worst for the party who makes the greatest change, and whose position is consequently the falsest. In such a case, one may really be said to gain a loss. Unsuitable matches are awkward and troublesome to more than the parties themselves. It is common for persons who have made such alliances to say that they had a title to please themselves; but this is a maxim to be taken with some exception. A married pair are not quite isolated in society. They are on the contrary associated and connected with many persons who owe to them, and to whom they owe, duty. It is felt by these persons that the unsuitableness of the match is productive of much inconvenience to them, and must needs be so, while such a thing as society exists. It is therefore in some measure necessary, in marriage, to please friends, as well as one's self, if we would discharge all the obligations under which we lie as social beings. When a man or woman of some rank marries a person of greatly inferior condition, a great and real offence is unquestionably committed, and the consequent alienation of friends, though to be deplored, is only what is to be expected.

Harmony of character is as needful as equality of condition. When fortune joins the gentle to the rude, she certainly commits one of the most wanton of all her pranks. There is a theory which probably has taken its rise in a wish to find a final cause for the many inharmonious unions which are formed—that nature delights in uniting opposites. The only countenance which the doctrine has is in the noted caprice which makes tall men select short women, and short men tall women, dark men fair women, and so forth. There is perhaps some principle of taste which produces these odd associations, but it is greatly to be doubted if opposite dispositions ever lead to a feeling of preference. All that we know of mind teaches us, on the contrary, that souls sympathise only under the influence of a community of sentiment. When a gentle nature is drawn into connexion with an ungentle one, it is probably either through the efficacy of some external circumstances, or by the working of that venerative principle which, in all love affairs, produces a blindness to the real qualities of the object. The refined come into conjunction with the coarse, the enlightened with the ignorant, the benevolent with the severe, through similar causes; and from all such alliances only misery can come. The wreck of peace produced by an inharmonious marriage, and the almost hopelessness of redress, present one of the most distressing views of human affairs which we ever meet with. And it is difficult to reconcile with justice our condemning to perpetual misery a person who has only been unfortunate in the choice of a mate. Such pairs are forced, or all but forced, by society to remain together, not exactly because their separating would be an evil in itself, but because it is feared that the least facilitation to divorce would produce a general disposition to dissolve the marriage tie. It has always seemed to us highly questionable if the relaxation of the laws on this subject would be attended with any such effect, for, first, the natural disposition is, not to separate, but to remain together, as is shown by the pertinacity with which even unhallowed unions are maintained; and, second, there is greater laxity in some countries than in others, without having the slightest observable effect in inviting to separation. But this is a critical subject, and not strictly under our view at present; so we shall leave it with the remark that, in the present arrangements, there is certainly a powerful call for the exercise of caution with regard to the dispositions of the party with whom an alliance is to be formed.

Matrimony presents occasion for the exercise of conscientiousness towards somewhat extraordinary objects. Where any one, by marrying, has a great chance of injuring the happiness of the other party, it certainly ought to be a point of conscience to avoid taking the step. The circumstances of some men—with regard, for instance, to the nature of their profession [this is particularly the case in the army], or with regard to their income [this is a more general case]—are such, that there is no reasonable prospect of happiness for their partner. They are therefore bound to postpone coming under this obligation until they shall be in more favourable circumstances. There is a large class of both men and women who are disqualified for matrimony by their condition as to health. Where there is some simple disease, about which no concealment is affected, or where there is the obvious feebleness of old age, the association will be fair enough, if both parties are willing. But where there is a deep-seated and fatal disease, which does not make an appearance, and where the party so affected marries, or even commences or encourages addresses, without a full disclosure of the nature of the case, the act is a fraud, and one of a gross and dangerous character. It may be that the erring party is young, and ignorant of the full extent of the evil done; but in this case the guilt is only transferred to parents or other guardians. Where there is a liability to hereditary disease, it becomes a duty both to others and one's self to abstain from the marriage tie. It may be very true that such is only an inherited misfortune, and that it is a hardship for such a person to be debarred from an association which others enter into for the promotion of their happiness; but these are only smaller evils which it is proper to submit to in order to avoid greater. By forbearing from matrimony, the evil is kept at its original amount; by marrying, the risk is incurred of widely enlarging it. A person who takes a hereditary disease into the marriage connexion, may be said to be laying the foundation of a life of trial and misery. Like all other selfish wrong acts, it is severely punished. An offspring probably arises, only to be sources of anxiety and affliction to their parents, or to wring their hearts by what reason may afterwards acknowledge as a comparative mercy—premature death. It often happens that such a family observes a regular time in succession for beginning to pine, reaching a crisis, and then dropping into the grave. Imagine the feelings of a parent who sees these nevertheless endeared objects going on to their almost certain doom, conscious that earthly aid is all in vain to counteract the decrees of nature. Or suppose the more agonising feelings with which the first symptoms of a hereditary mental taint are observed arising. The heart of the unconcerned melts with compassion at the mention of such distresses; yet there cannot be a doubt that the parties are only reaping the harvest of the herb of bitterness which they have sowed. Nature tells that certain malignant ailments go from parents to children. Reason therefore infers that persons so affected ought not to marry. This is a counsel which they are bound to obey. Do they disregard the injunction, they have only themselves to blame for the consequences. The most sympathising bystander must see and acknowledge this truth. It is unfortunate that many have but obscure notions of

* See Journal, No. 3. † No. 40. ‡ No. 243.

‖ "Ideas respecting the Fair Sex," No. 494.

the government of these matters by invariable natural laws. In perfect ignorance, or in some vague hope of escape, they rush into circumstances which may be said to secure their ruin. Were they fully aware of the truth, they would avoid such circumstances sedulously. Conscientiousness to the other party in the matrimonial contract, demands their doing so. Nay, it is demanded by more than this—conscientiousness towards the possible offspring of the alliance. To usher into existence beings who are only to be a burden to themselves, and condemned from the first to early death, is an act as evil in its consequences as to inflict deadly injury upon a healthy person; and, where this is known, the act is not less strongly forbidden by a right morality. The views of society upon these points are as yet very imperfect; but we do not despair that the time will arrive, when either to marry with disease, or to marry a diseased person, will be shrunk from as one of the most flagitious of acts, and visited, where it occurs, with the same reprobation which is now bestowed on fraudulency and gross outrages of all kinds.

It seems at first sight to admit of some question how far it is right to recommend a selection of the best women and men for husbands and wives, as that would imply that a number are to be left over on account of what are perhaps only natural misfortunes. But, on a more careful consideration, such selection appears quite legitimate. It is better that the weakly and the foolish be left over, than that the sound and rational should be so, because the former are the least likely to enjoy happiness in the married state. Still more clearly is this the case, considering that it is better that the race should be continued from good than from inferior stock. It is therefore only right for both men and women to endeavour to obtain as good specimens of the opposite sex for their partners as possible. A good general figure is a point worth looking to in all cases; but young ladies especially are apt to make it rather too important a one. What would they think of an advice to look for a well-developed head, as a not less important point? The large heads tend to the upper strata of society, the small heads the contrary way. To be married to a youth of perhaps inferior present rank, but who from this cause is rising in life, is apt to turn out much preferable in the long run to marrying a perfect equal, whose development of brain indicates the probability of a declining course. Let no man, on the other hand, who wishes that his children should possess competent ability, ally himself to a small-headed woman. The volume of brain is hereditary, as well as tallness and a fair skin. Indeed, this is the case with all natural characteristics; and it may be laid down as a general rule, that such qualities as we should like in children, such qualities should we look for in the associate of the conjugal yoke.

THE LIFE AND POETRY OF HORACE.

SECOND ARTICLE.

AFTER the Odes of Horace, his *Satires* fall under review. Of these he has left eighteen, which are distributed into two books. Luxury, avarice, and affectation, the prevalent vices of the time, he assails with much sound sense and easy raillery. Employing on purpose, in this class of compositions, a homely, conversational style, whence his allusion to his "pedestrian muse," he not only directs his powerful ridicule against the local and ephemeral modes of vice and vanity, but probes, with a steady and scientific hand, those permanent principles in human nature, which are ever ready to throw off a fresh race of follies as soon as their predecessors have vanished. Take the following verses, which form the introductory section of the First Satire, as a specimen. The poet illustrates the discontent produced by covetousness. He addresses Mæcenas:—

How happens it, my friend, that none 's content,
Nor likes the lot or choice or chance hath lent;
Turns from his own employ with perverse will,
And after that of others hankers still?
"Oh, happy merchants!" thus the veteran sighs,
As o'er his war-worn frame he casts his eyes;
While thus the merchant, tossing on the brine—
"A soldier's life is better far than mine:
For why, I'm ever on the rack; but he—
An hour will bring him death or victory!"
The man of law, to whom at cock-crow swarm
A pack of clients, lauds the quiet farm:
The simple farmer to the city come,
Vows none are bless'd but those that live at Rome.
There's many a case would suit my aim as well,
'Twould tire the babbler Fabius' self to tell:
So here's my point. Suppose some god should say,
Good-naturedly, "Well, each may have his way:
You, soldier, be a trader; lawyer, you
Shall, since you wish it, be a farmer too.
So off! Why linger ye?" Why, each is fain
To lose the boon, and be himself again.
And yet they *might* be bless'd! Why, where's the wonder
If he, the wrathful sovereign of the thunder,
Should puff his cheeks, and, for the future, swear
He'll not so readily fulfil their prayer?

—*Satires*, I. 1.

In the satire of which we next translate a portion, Horace describes, with exquisite humour, the molestation he had suffered from the pertinacity of a *bore*. After various ineffectual attempts to shake off this "weaver of long tales," he hopes at last to carry his point by the connivance of a friend, in a little stratagem which his seasonable appearance has suggested. He is, as the event proves, too sanguine. The waggish acquaintance enjoys the poet's vexation too keenly to come to the rescue; affects respect for the day, which happened to be one of those held sacred by the Jews; and so sheers off, leaving Horace in the hands of his tormentor. At this juncture, the plaintiff in a suit, in which the babbler was defendant, luckily appears, and effects the desired riddance. An allusion here requires a little explanation. When a prosecutor wished to compel the attendance of his adversary before the prætor, the adversary being unwilling to go, he was at liberty to drag him thither by force, provided he first touched the ear of any person present, and secured his attestation to the refusal. If this ceremony were omitted, the arrest was deemed illegal. "The ancients believed that the seat of the memory was in the tip of the ear; and hence their custom of touching it, in order to remind another of a thing, or for the purpose of calling him to witness any circumstance or occurrence."*

Thus chatter'd he: when Fuscus comes in view,
A friend of mine that well my pesterer knew.
Our greetings over, straightway I begin
To twitch, significant, his callous skin,
Provokingly pinch-proof; I nod full sly;
A thousand gestures show my agony:
I summon worlds of meaning into a squint;
In vain: the rogue plays shy to every hint.
"You had some matter to disclose, I thought—
Something or other, though I know not what:
A secret 'twas; I long to hear't, I vow."
"True, I remember; but won't tell you now.
Another time, for all I've got to say,
Will serve—I see you are engaged to-day:
Besides, 'tis thirtieth Sabbath; surely you
On no account would thus affront the Jew?"
"I've no such scruples, I assure you." "Oh,
But all the world are not enlighten'd so;
I have my weak side, I must own with pain—
My friend, excuse me, we shall meet again."
Black day! he leaves me: when, by happy chance,
Who but the foresaid plaintiff should advance!
"Where now, you scoundrel?" (he accosts my friend):
"Sir, you'll be evidence?" (to me): I lend
My ear with right good-will: away they go,
A mob their convoy: Phœbus saved me so.

—*Satires*, I. 9.

At Rome, in the time of Horace, fortune-hunting had become a profession. In an imaginary dialogue between Ulysses and Tiresias, the blind prophet of Thebes, introduced in the Odyssey, the poet covertly satirises the mean practices of his countrymen. From this performance we extract the following passages. The version is by Dr Dunkin, the coadjutor of Francis.

ULYSSES.

How poor and naked I return, behold,
Unerring prophet, as you first foretold.
The wooing tribe,† in revellings employ'd,
My stores have lavish'd, and my herds destroy'd;
But high descent and meritorious deeds,
Unblest with wealth, are viler than sea-weeds.

TIRESIAS.

Since, to be brief, you shudder at the thought
Of want, attend how riches may be caught.
Suppose a thrush, or any dainty thing,
Be sent to you, dispatch it on the wing
To some rich dotard. What your garden yields,
The choicest honours of your cultured fields,
To him be sacrificed, and let him taste,
Before your gods, the vegetable feast.
Though he be perjured, though a low-born knave,
Stain'd with fraternal blood, a fugitive slave,
Yet wait upon him at his least command,
And always bid him take the upper hand.
* * * * *
If any one desires you to peruse
His will, be sure you modestly refuse,
And push it from you; but obliquely read
The second clause, and quick run o'er the deed,
Observing whether, to reward your toil,
You claim the whole, or must divide the spoil.

—*Satires*, II. 5.

In Roman wills, which were generally written on tablets overspread with wax, the first line or clause was occupied by the name of the testator; the second, as is above intimated, would contain that of the legatee. A man was at liberty to pass by his nearest relatives, and constitute whom he pleased his heirs, provided the persons nominated were Roman citizens.

The lively sarcastic vein which pervades and is proper to the satires of Horace, is likewise so characteristic of his *Epistles*, that many eminent critics have viewed the latter as simply a continuation of the former. The distinction between the two classes of compositions is, however, sufficiently marked by a variety of circumstances. The individuality of address, the range of topics, and the constant exclusion of dialogue, clearly establish the propriety of the title under which the epistles have come down to us.

The letters of the first book, of which there are twenty, are mostly familiar or moral. The poet skips with great alacrity from gay to grave. At one time he is eulogising Homer; at another, excusing himself for having ill-pared nails or a threadbare shirt; now he is discoursing on the excellence of virtue, anon he is inviting a friend to supper. These productions are supposed to have been written when their author was verging on fifty. We translate entire, as a favourable specimen of the lighter sort, the epistle to a celebrated contemporary poet:—

TO ALBIUS TIBULLUS.

My friendly critic, think you I can guess
How you employ your rural loneliness?
Art writing verses which shall more than vie
With even Parman Cassius' elegy?
Or art thou sauntering through the healthful wood,
Revolving themes beseem the wise and good?

I know thou art: that form of thine, so fair,
Is genius' home, nor soul is wanting there.
Heaven gave thee wealth, nor did kind Heaven refuse
A better boon—the wit that wealth to use:
What could her suckling nurse's wish assign,
Save person, genius, fortune, fame like thine?
Yet take advice: howe'er your life be pass'd,
Act as you thought each day that dawns your last;
For so, should many chance to be in store,
You'll relish each new-comer all the more,
And live, with keener zest, the unexpected hour.
In fine, my friend, if ever dull you be,
Then come my way, and have a laugh at me:
In good condition, fat and sleek, am I—
A well-fed pig of Epicurus' sty.

—*Epistles*, I. 4.

The epistle to Bullatius, of which we extract only the concluding section, may be read as a commentary on Milton's emphatic axiom—"The mind is its own place." From an obscure intimation in one of his odes, it would seem that Horace had once been in danger of shipwreck. The remembrance of his former jeopardy might whet the zeal with which he reprobates the rage for travel. We here use the version of Francis:

Believe me, at delicious Rhodes to live,
To a sound mind no greater bliss can give
Than a thick coat in summer's burning ray,
Or a light mantle on a snowy day,
Or to a swimmer Tiber's freezing stream,
Or sunny rooms in August's mid-day flame.
While yet 'tis in your power, while fortune smiles,
At Rome with rapture vaunt those happy isles;
Then with a grateful hand the bliss receive,
If Heaven an hour more fortunate shall give.
Seize on the present joy, and thus possess,
Where'er you live, an inward happiness.
If reason only can our cares allay,
Not the bold site that wide commands the sea;
If they who through the venturous ocean range,
Not their own passions, but the climate change;
Anxious through seas and land to search for rest
Is but laborious idleness at best:
In desert Ulubræ the bliss you'll find,
If you preserve a firm and equal mind.

—*Epistles*, I. 11.

The second book contains only three epistles. In the opinion of Hurd, these are "the best and most exquisite" of the works of Horace. The first and third are throughout critical; an epithet scarcely applicable to the light gossip of the second. The former compositions bear a relation to his other epistolary and satirical writings, very similar to that subsisting between Pope's "Epistles" and his "Essay on Criticism." We must reserve our attention for the third, which is better known under the appellation of the *Art of Poetry*. In this composition he sets out somewhat abruptly, with a very forcible illustration of the grotesque effect produced by patches of false ornament in composition; guards against abuse of the poetic license; enforces the necessity of a just estimate of one's own powers; adverts to the beauty of an unaffected diction, admitting at the same time that words have their generation as well as men, and observes that custom is the supreme arbiter of language; and then specifies the different measures appropriate to the various orders of poetry. Here he launches into a disquisition on the drama, both as written and acted, enjoining a strict attention to the proprieties of situation and character, and counselling the removal of murders and the like revolting spectacles from the stage. He exhorts aspirants to dramatic fame to the daily and nightly study of the Grecian models; ridicules, in his keenest style, the folly and presumption of those who declined to "use the pruning-knife," pleading genius as an apology for the neglect of revision; and yet rebukes the captious criticism, which, passing by without eulogy the conspicuous beauties of a composition, only fastens, like the flesh-fly, on the tainted part. He then, addressing himself especially to the elder of the young Pisos, enlarges on the necessity of distinguished excellence in order to the establishment of such a reputation as he seems to have set his heart on; observing that, though moderate talents might command success in other lines of useful exertion, poetical mediocrity was alike intolerable "to gods, to men, and to booksellers." After delivering the celebrated advice, to suppress a piece till the ninth year after its production, and pronouncing a warm panegyric on the masters of ancient song, he glances at the oft-mooted question, whether art or genius enters the more largely into the composition of good poetry. He declares both indispensable; and holds up, in conclusion, by way of bugbear to all unlicensed trespassers on Parnassus, a highly graphic picture of a bard run mad.

In the passage which we select as a specimen, there occurs a much-quoted line, which runs literally thus: "He bears off every point who has blended the useful with the sweet." The allusion is to the manner of recording votes at the elective assemblies of the Romans. Each of these was indicated by a *dot* on a tablet; consequently, he who *bore off all the dots* was the successful candidate. Hence is derived the English phrase, to *carry one's point*.

Poets design to profit, or delight,
Or useful things in pleasing verse convey.
When morals you instil, be brief; and then
Your precepts will be readily retained.
* * *
The aged will explode an idle tale,
And stories too severe disgust the young;
But he who joins instruction with delight,
Profit with pleasure, gains the praise of all;
For such a work shall live, pass o'er the seas,
And bear to future times the author's fame.
Yet there are faults which pardon may deserve:
Not every string obeys the master's hand,

* Anthon. † Penelope's suitors.

Nor always can the archer hit the mark.
So, in a work where many beauties shine,
I will not cavil at a few mistakes,
Which inadvertence sometimes may commit,
Or human nature could not wholly shun.
What then? Suppose a copyer should transcribe
The same words wrong, though often told his fault;
Or a musician the same jarring strings
Repeat—who could abstain from ridicule?
So he who trips at every other line,
May justly be compared to Choerilus;*
For, when he stumbles on a shining verse,
I smile to see it in such company,
And wonder by what magic it came there;
But fret whenever honest Homer nods.
—*Duncombe's Version.*

In that class of his writings which has come under review in the present article, Horace appears as the possessor of qualities which rarely enter into the mental conformations of those whom he has himself so felicitously dubbed, the *genus irritabile vatum*.† That accurate self-knowledge, that exact measurement of his own intellectual proportions, that fine instinct which taught him the limits of his own strength, and prevented him from overstraining it, to which these, and indeed all his works, are the infallible indices, are endowments but seldom seen allied to that ardent, generous, imaginative temperament, which is the very source and soul of poetry. And yet these apparently antagonist attributes weld together in, and impart its distinctive idiosyncracy to the genius of Horace. His satires and epistles show the man of the world—the keen Crabbe-like observer of every-day life and manners—the shrewd yet good-natured unmasker of the faults and the follies of his fellows. He peers into the most secret nooks of the human heart, and lays his finger on the very foibles that seemed best screened from detection. In these admirable performances, there is no straining and no affectation; he does not sink into vulgarity, nor does he strut in heroics. There is no writer with whom one feels so soon on the easy footing of a companion.

"Horace still charms with graceful negligence,
And without method talks us into sense;
Will, like a friend, familiarly convey
The truest notions in the easiest way."

It is in the Odes, however, that Horace towers into the poet, and puts on the grandeur of the "diviner mind." These, in his own judgment, formed the monument on which his name was to stand inscribed for the homage of posterity. For music of cadence, for purity of diction, and for beauty of sentiment and imagery, each of the odes will ever be esteemed a model and a study; and in his hands the Latin tongue becomes an instrument more delicate and flexible than it ever approves itself in those of any other writer.

PREDISPOSITION TO BLEEDINGS.

It is now pretty clearly understood that almost every individual human being has something peculiar in his physical organisation—some characteristic which renders him liable to special impressions from certain classes of circumstances and casualties. By this it is not meant that every single person differs in constitution from every other person. Scientific observers have seen grounds for arranging mankind into classes, according to their peculiarities of constitution; and it it is found that, as our temperament may chance to be nervous, or sanguine, or bilious, we will be exposed to particular impressions, in each case, from particular circumstances. There is a species of idiosyncrasy, however, which has not attracted so much attention as other constitutional peculiarities, being, indeed, of comparatively rare occurrence. At the same time, it is a physical singularity of the most remarkable kind, mysterious in its nature and striking in its effects. When it comes before medical men in the case of any patient, they term it the *Hemorrhagic Diathesis;* that is, a tendency to bleedings or fluxes of blood, from any hurt or lesion of the skin, to an extent far greater than is common with persons ordinarily constituted. So strong is this liability in some instances, that a leech-bite has caused death, the flow of blood having proved irrepressible by all the usual means. Another feature, distinguishing this idiosyncrasy, is its hereditary character. It has been observed to pass from generation to generation, and to pervade whole families. From attending to the cases of this kind on record, both instruction and warning, interesting to many, may perhaps be derived.

The extraction of teeth has frequently called into perilous and fatal action the hemorrhagic diathesis; and surgeons seem to have had their attention first directed to the subject by accidents resulting from that operation. In a work published at Paris in 1778, by M. Jourdain, a dentist, we find various early cases alluded to. Haller mentions a case of mortal hemorrhagy, caused by the extraction of a tooth. Plater gives an example of a locksmith, who had a tooth extracted, and was seized in consequence with a flux of blood, which resisted all remedies, whether in the form of compression, touching with caustic, or cauterisation with red-hot iron, and terminated fatally. In these and other early cases, the surgeons conceived that a small *artery*, or vessel carrying blood directly from the heart, had been wounded, thus producing the fatal issue. No artery, at least of such a bulk as to cause any danger, lies at the roots of the teeth in ordinary circumstances; but it is indubitable, that irregularities in the distribution of the blood-vessels do sometimes take place, causing operations otherwise safe to become seriously dangerous. Such irregularities are very rare, however, and the old surgeons only resorted to this explanation, because they were unacquainted with the existence of any peculiar constitutional tendency to hemorrhage in individuals. In those early cases, where a cure was effected, pressure was the means employed; in one instance, a melted plaster was introduced into the socket of the tooth, and, in another, a portion of a bean, fixed down, was successfully used to stop the bleeding.

The truth respecting the existence of a hemorrhagic predisposition in individuals, was made strikingly apparent in a case recorded by Mr Blagden in 1816. Joseph Langton had a tooth extracted when a boy; an oozing of blood followed, and ceased only at the end of twenty-one days. The slightest wound, in this boy's case, caused dangerous hemorrhage; and one trifling hurt in the forehead, in 1815, had been followed by a flow of blood, which even the tying of both ends of the small bleeding vessel failed to check. Blood still oozed from the open surface, but caustic (potass) at length stopt it. The boy and his friends were so far made aware of the existence of some dangerous peculiarity in his constitution, that, when toothache again troubled him, it was for a time considered better to bear it than risk the extraction. At last, the tooth, one of the grinders on the left side of the upper jaw, was taken out. Profuse bleeding followed; and, on the day succeeding the operation, caustic, cold applications, and pressure by plugging, were all tried, but with, at best, merely temporary advantage. On the fourth day, the hemorrhage still continued, and the actual cautery, or red-hot iron, was applied, which checked the flow for a few hours. On the fifth day, the bleeding went on, and the boy was reduced so low, that it was resolved to tie the carotid artery of the left side of the neck, one of the great sources of the blood in the face and head. The operation was performed; but to the ill-fated youth it proved only a new avenue to dissolution. The *wound made by the operation* began in the course of a few minutes to bleed profusely; ice checked it; but, on the removal of the ice, it instantly broke out afresh. As for the bleeding from the tooth, it was stopped for a few hours by the operation, but again returned; and, on the seventh day from the removal of the tooth, the boy died.

There did appear to be in this case something peculiar about the poor lad's tooth, matter of a purulent kind having come from the socket; but the other circumstances prove sufficiently that a remarkable predisposition to bleeding, from any lesion of the skin whatever, existed in the boy, and was the immediate cause of death. It has been observed that this extraordinary peculiarity was hereditary, and pervaded families. Krimer mentions one family, of which the male descendants, for four generations, had been strangely liable to bleedings; and M. Sanson, in a treatise published in 1836, mentions a case, where a man died from a slight hemorrhage, having been preceded to the grave by *six* children, *all* of whom were cut off by the bleeding consequent on casual wounds. In an American essay on the same subject, the following case is recorded among others:—"A. B., of the state of Maryland, has had six children, four of whom have died of a loss of blood from the most trifling scratches or bruises. A small pebble fell on the nail of a finger of the last of them when at play, being a year or two old; in a short time, the blood issued from the end of the finger, till he bled to death." The sister of these children had no such peculiarity. Mr Liston also relates the case of a family of seven brothers, all of whom were affected by the hemorrhagic diathesis, while their five sisters could bear wounds without any unusual danger. Of one of these brothers whom Mr Liston saw, it is mentioned that he was a large, strong-made man, without any thing peculiar or unhealthy in his aspect.

The last instance in proof of a hemorrhagic predisposition in individuals which we shall give here, is a very remarkable one which occurred in Edinburgh in December 1841. Two reports have been given of it in the medical journals—one by Dr Roberts, dentist, and the other by Dr David Hay, who accompanies his statement with a number of analogous cases, of which those already noticed form examples. Mr C. P., a gentleman of middle age, came to Dr Roberts on the 19th of December, and had a decayed *wisdom*-tooth taken from the under jaw. No unusual bleeding ensued at first; but, on the evening of the same day, a continuous stream of blood was flowing from the socket. Dr Roberts, being applied to, checked it for the time by a plug of lint, compressed with a piece of cork. It soon broke out anew, however, and, for three weeks and two days, continued to bleed, with occasional intermissions caused by the various remedies employed. Full trials were made of caustic, the use of which is to burn and shrivel up the ends of the bleeding vessels, so impeding the sanguineous flow. The cautery, or red-hot iron, was applied more than once; and on the second trial of it, the lip was slightly burned by accident. The result of this accident showed but too clearly what the nature of the case was; an oozing of blood took place from the *burn*, which continued for days. Cold lotions were used, and pressure exerted in various ways; all was in vain. In place of a lessened flow of blood to the head, it seemed, after several days, as if more blood were actually directed to that region. The face became much swollen and discoloured, as if from the effects of a blow; and an oozing also commenced from the gums and nostrils. Still considerable hopes were entertained from the 23d to the 31st of December, the oozing remaining comparatively slight, though almost continuous; but the worst symptoms suddenly recurred, and the patient sank on the 11th of January, notwithstanding all the exertions of his able attendants.

It may not be very common for cases to occur, where the predisposition to bleedings is so extremely strong as in the instances recorded. But where they are liable to occur, even in a modified form, guarded conduct is advisable; and, moreover, from what takes place in the instance of one member of a family, another may at least learn a lesson of prudence. The unfortunate gentleman, whose case has just been stated, had a tooth extracted three years before his death, and a bleeding of three days' duration followed. Had he been aware of such a case as that of the boy Langton, or had he been generally informed on the subject, he would in all likelihood have received a warning which might have prolonged his life. He erred, indeed, in not relating his former experience to Dr Roberts, who might have timeously cautioned him. For these reasons, the relation of such cases to the public may, it appears to us, be of great service.

The cause of the hemorrhagic diathesis is supposed to be a deficiency of the *fibrine* or *thicker portions* of the blood, which prevents the formation of a coagulum or *clot* at the mouths of wounded vessels. Flows of blood are naturally stopped, in ordinary cases, by such clots. The remedial means to be employed, where bleedings occur in persons predisposed to them, must depend, to a certain extent, upon the site of the bleeding. It is not uncommon for *leech-bites* to cause long and dangerous bleedings in children. Frequently, the employment of pressure, continued for a lengthened time, is efficacious in checking the flow; but sometimes ordinary pressure, caustics, and even hot iron, are applied in vain. The passage of a very fine needle from lip to lip of the wound, and the twisting afterwards upon the needle of thread in the shape of a figure of eight, has often been found effective where other means have failed. Often, in the case of persons even but slightly predisposed to bleeding, an alarming flux comes from the *nostrils*, which resists cold applications and other common remedies. Pressure is here the most effective remedy, and it is one, happily, which can be readily used by non-professional persons. Lint may answer the purpose, but other substances have been found more efficacious. One substance, we are assured upon excellent authority, answers the end peculiarly well, and has been long in use among the common people of some districts of Great Britain. This is simply a portion of the blood *dried*. The fluid matter being expelled by heat, the fibrine and thicker parts are left, which are the very materials wanted by the thin flowing blood to make a clot. This remedy is at once simple, and must necessarily be ever at hand. With regard to bleedings from the socket of an extracted *tooth*, fatal in so many cases, it seems to us, after an examination of the cases recorded, that, where the hemorrhagic diathesis is marked and strong, *pressure* is the only safe and effectual remedy. The repeated use of caustics appears to blister the gums, and but to add fresh outlets, ultimately, for the oozing blood. Even the operation of tying the carotid artery, in the boy Langton's case, only accelerated the fatal result. Pressure, while it can do no injury, seems best fitted to do good. The question is—what is the best material to use in exerting pressure on the socket? Obviously such a substance as will best contribute to the formation of a clot in the mouths of the open vessels. The simple pressure of a hard unyielding substance will scarcely do this, as a hard body cannot mould itself into the shape of the cavity, and the blood will too readily force a way past it. One medical gentleman has been successful, where all other remedies failed, with *plaster of Paris*, introduced into the socket in a soft state. In this case, the liquid parts of the flowing blood would be absorbed by the plaster, and the thick parts, forming the clot, left at the mouths of the vessels. It is probable that this substance will be found a valuable resource in such cases. The other substance mentioned above, namely, blood dried or nearly dried, would in all probability form an equally valuable material for filling the socket, though we are not aware if it has yet been used in the case of bleedings from the teeth. Where either of these substances, or common lint, or any other material, is used to fill up the socket, it is necessary to keep it down and compress it, by means of cork, or something of the kind, properly fixed.

As bleedings are much more easily checked at the outset, for the most part, than after they have been permitted to continue for a time, these hints regarding the use of pressure may prove not altogether unserviceable in guiding the public, where medical aid is not at hand. And, moreover, as already observed, the present remarks may afford that caution which, in the case of Mr C. P., might have lengthened a valuable life. At the same time, it should be kept in mind, that instances of a strong hemorrhagic diathesis are rare; and that, in ordinary cases, fluxes of blood are perfectly under the command of medical men, whether after operations or otherwise. It would

* A wretched versifier in the train of Alexander the Great.

† The irritable tribe of poets.

be foolish, indeed, for persons with no constitutional peculiarities of the kind under consideration, to neglect the means which nature and art have provided for the relief of suffering, from any fear of consequences which depend on a specific cause, and which are only witnessed where that cause exists in a marked degree.

JOSEPH STURGE'S VISIT TO THE UNITED STATES.

Joseph Sturge is a respectable and intelligent member of the Society of Friends, who, twelve months ago, left his quiet home near Birmingham to visit the United States, for the purpose of contributing his mite of encouragement to the cause of slave abolition, and the promotion of permanent international peace. On his return he has favoured the world with an account of what he saw, experienced, and thought, during his journey, on these great subjects, but chiefly that of the abolition of slavery.* We have perused the work of Mr Sturge not without gratification, both as respects his observations and the circumstances which came under his notice, but with much less satisfaction than we had reason to expect from the production of a man usually so clear-headed. The style is far from being perspicuous, and the account of the journey is so retarded and confused with extraneous matter, that the reader has the greatest difficulty in knowing at any time where the author is, or what he would exactly be at. We fear the volume has been written in haste, and without a precise idea of that great desideratum in the narrative of a tourist—taking the reader in all cases along with him.

In looking over the work, we find a few matters worthy of remark or extract. It appears that two or three years ago, a serious schism broke out among the abolitionists in the United States, and certainly about one of the most paltry affairs which ever unsettled a great cause: the source of disquietude was, whether women should be placed on committees, and vote along with male members of the anti-slavery body. An actual separation in the societies took place in the spring of 1840, and there are now two leading societies, "The American and Foreign Anti-slavery Society," and "The American Anti-slavery Society." We are glad to learn from Mr Sturge, that notwithstanding this unseemly rupture, "a better and kindlier feeling is beginning to pervade all classes of American abolitionists; the day of mutual crimination seems to be passing away, and there is strong reason to hope that the action of the respective societies will henceforward harmoniously tend to the same object." According to our author, the members of the Society of Friends in the states are any thing but warm in the cause of abolition. What is the reason for this is not clearly stated. It appears, however, that the Friends have lent a helping hand to the schemes of the Colonisation Society, and this is considered a serious error in principle. This society, it may be necessary to remind our readers, is an association organised and supported by voluntary contributions, to assist free persons of colour, who may find themselves uncomfortable in America, to emigrate to Liberia, on the coast of Africa, where now, as lately mentioned by us, there is a flourishing little nation of civilised blacks. This society has met with the uncompromising hostility of nearly all abolitionists, and it is spoken very disparagingly of by Friend Sturge. The charges made against the Colonisation Society seem to amount to this, that the society distracts attention from the principal object of pursuit—total and immediate abolition, and contemplates the expatriation of the coloured race from America, on the ground that amalgamation with the whites is impracticable. These charges may or may not be true, for any thing we know; but it is abundantly evident that the grand crime of the Colonisation Society is not uniting in the projects of the leading abolitionists. The whole affair, we fear, is a matter of jealousy. No man must relieve the pressure of slavery in any other way than is sanctioned by those at head-quarters, because that would be depriving these personages of all glory in winning the battle. The success of the Liberian scheme, which, one would think, would delight every humane mind, is odious to the great party-leaders of the anti-slavery societies. It is an achievement from which they derive no honour; they did not plan it, and it is proceeding without their assistance. How melancholy is it to find the meanest motives thus mixed up with what is truly the greatest secular cause in which men can be engaged!

Leaving the Colonisation Society, however, to settle its own disputes, we are more pleased in turning to parts in Friend Sturge's narrative which give token of an improvement in the American public mind respecting the treatment of coloured persons:—"One evening during my stay, I took tea with twelve or fifteen coloured gentlemen, at the house of a coloured family. The refined manners and great intelligence of many of them would have done credit to any society. The whites have a monopoly of prejudice, but not a monopoly of intellect; nor of education and accomplishments; nor even of those more trivial yet fascinating graces, which throw the charm of elegance and refinement over social life. I found, from the conversation I had with my coloured friends on different occasions, that the prejudice against them was steadily, and not very slowly, giving way; yet several instances were mentioned, of recent occurrence, which show that it is still strong. I will quote one only. A coloured gentleman informed me that last winter, a near female relative being about to take a journey by railway to Philadelphia, she was compelled, though in delicate health, to travel in the comfortless exposed car, expressly provided for negroes, though he offered to pay double fare for a place in the regular carriage. A lady, not of the proscribed class, who has long resided in New York, mentioned to me, as a marked indication of a favourable change in regard to colour, the holding of such meetings as those at which the Amistad captives were introduced. Such an exhibition, instead of causing a display of benevolent interest among all classes, would some years ago have excited the malignant passions of the multitude, and probably caused a popular outbreak. Another sign of the times was, that white and coloured children might be seen walking in procession, without distinction, on the anniversaries of the charity schools. The same lady, in whose veracity I place full confidence, informed me that there is now residing in this city a native of Cuba, formerly a slave-holder at the Havana, who narrowly escaped assassination from a negro. He had threatened the slave with punishment on the following day, but the desperate man concealed himself in his master's room, and in the night stabbed and killed his mistress by mistake, instead of his master. Three negroes were executed as principal and accessories; but their intended victim was so terrified, that he left Havana for New York. His fears, not his conscience, were alarmed, for he still carries on his diabolical traffic between Africa and Cuba, and is reported to have gained by it, last year, one hundred thousand dollars. He lives in great splendour, and has the character of a liberal and generous man, but with the most implacable hatred to the blacks. 'One murder makes a villain, thousands a hero.' How wide the distinction between this man and the wretches who paid the forfeit of their lives for a solitary murder!"

A little farther on, he says—"A fine black man was brought to me about this time, who showed me papers by which it appeared he had lately given one thousand five hundred dollars for his freedom. He had since been driven from the state in which he lived, by the operation of a law enacted to prevent the continued residence of free people of colour, and has thus been banished from a wife and family, who are still slaves. He has agreed with their owner, that if he can pay two thousand five hundred dollars in six years, his wife and six children shall be free; and he was then trying to get employment in New York, in the hope of being able to raise this large sum within the specified time."

"I subsequently," he observes, "visited, in company with a coloured gentleman, one of the principal coloured schools in New York, in which there were upwards of three hundred children present. All the departments appeared to be conducted, under coloured teachers, with great order and efficiency, and the attainments of the higher classes were very considerable. On the whole, this school would bear comparison with any similar school for white children which I ever visited."

Mr Sturge visited Washington in the course of his tour, one of his objects being to present an address to the President of the United States from the committee of the British and Foreign Anti-slavery Society, signed by Thomas Clarkson. A communication which he made to the president on the subject met with no reply, and the address was never delivered. The president's non-reply was shabby, but perhaps politic and consistent with etiquette. We question if an English monarch would receive an address from a foreigner, praying his majesty to use his influence in dissolving one of the most prominent national institutions.

At Baltimore, a slave-holding city, Mr Sturge was glad to find that free people of colour were fully alive to the importance of education. "One individual told us, that in distributing about two hundred and fifty religious books, which had been sent to be gratuitously supplied to the poor of this class, he found only five or six families in which the children were not learning to read and write." In Virginia, considerable efforts have been made to promote general education; "yet the governor of Virginia, in his message to the legislature (1839), says, that of 4614 adult males in that state who applied to the country clerks for marriage licenses in 1837, 1047 were unable to write their names." Another authority says that there is reason to suppose that one-fourth of the people of the state cannot write their names. "The destitution of the means of moral and religious improvement is in like manner very great." Matters are very different in the old free states of New England, where few things are more striking than the number and commodiousness of the places of worship. Schools are likewise abundant. But the progress of temperance is most surprising. There are splendid hotels in which no intoxicating liquors are dispensed, and "it is now very rare to see a drunken person even in the most populous cities."

Visiting Lowell, a manufacturing town, which has been called the Manchester of America, he was much pleased with the great propriety of demeanour of the operative classes, particularly the girls employed in the factories. On this subject he quotes the following from a native authority:—"The most striking and gratifying feature of Lowell is the high moral and intellectual condition of its working population. In looking over the books of the mills we visited, where the operatives entered their names, I observed very few that were not written by themselves; certainly not five per cent. of the whole number were signed with a mark, and many of these were evidently Irish. It was impossible to go through the mills and notice the respectable appearance and becoming and modest deportment of the 'factory girls,' without forming a very favourable estimate of their character and position in society. But it would be difficult indeed for a passing observer to rate them so high as they are proved to be by the statistics of the place. The female operatives are generally boarded in houses built and owned by the 'corporations' for whom they work, and which are placed under the superintendence of matrons of exemplary character, and skilled in housewifery, who pay a low rent for the houses, and provide all necessaries for their inmates, over whom they exercise a general oversight, receiving about one dollar and one-third from each per week. Each of these houses accommodates from thirty to fifty young women, and there is a wholesome rivalry among the mistresses which shall make their inmates most comfortable. We visited one of the boarding-houses, and were highly pleased with its arrangement. A considerable number of the factory girls are farmers' daughters, and come hither from the distant states of Vermont and New Hampshire, &c., to work for two, three, or four years, when they return to their native hills, dowered with a little capital of their own earnings. The factory operatives at Lowell form a community that commands the respect of the neighbourhood, and of all under whose observation they come. No female of an immoral character could remain a week in any of the mills. The superintendent of the Boott Corporation informed me, that during the five and a-half years of his superintendence of that factory, employing about nine hundred and fifty young women, he had known of but one case of an illegitimate birth, and the mother was an Irish immigrant. Any male or female employed, who was known to be in a state of inebriety, would be at once dismissed." The next extract shows their prosperity in a pecuniary point. "The average wages, clear of board, amount to about two dollars a-week. Many an aged father or mother, in the country, is made happy and comfortable, by the self-sacrificing contributions from the affectionate and dutiful daughter here. Many an old homestead has been cleared of its encumbrances, and thus saved to the family, by these liberal and honest earnings. To the many and most gratifying and cheering facts, which, in the course of this examination, I have had occasion to state, I here add a few others relating to the matter now under discussion, furnished me by Mr Carney, the treasurer of the Lowell Institution for Savings. The whole number of depositors in this institution, on the 23d July, was 1976; the whole amount of deposits was 305,796 dollars and 70 cents (about L.60,000). Of these depositors 978 are factory girls, and the amount of their funds now in the bank is estimated by Mr Carney, in round numbers, at 100,000 dollars. It is a common thing for one of these girls to have 500 dollars in deposit; and the only reason why she does not exceed this sum is the fact, that the institution pays no interest on any larger sum than this. After reaching this amount, she invests her remaining funds elsewhere."

In addition to this satisfactory account of the working population of Lowell, Mr Sturge mentions the following fact as an instance of the spread of intellectual cultivation:—"I ought not to omit a notice of the 'Lowell Offering,' a little monthly magazine, consisting of original articles, written exclusively by the factory girls. The editor of the 'Boston Christian Examiner' commends this little periodical to those who consider the factory system to be degrading and demoralising; and expresses a doubt whether a committee of young ladies, selected from the most refined and best-educated families in any of our towns and cities, could make a fairer appearance in type than these hard-working factory girls."

In his general observations on all that had passed under his notice in the States, the author sums up his opinions on the social condition of the people at large as follows:—"In short, whether I consider the religious, the benevolent, or the literary institutions of the

* London: Hamilton and Adams. 1841.

northern states—whether I contemplate the beauty of their cities, or the general aspect of their fine country, in which nature every where is seen rendering her rich and free tribute to industry and skill—or whether I regard the general comfort and prosperity of the labouring population—my admiration is strongly excited, and, to do justice to my feelings, must be strongly expressed. Probably there is no country where the means of temporal happiness are so generally diffused, notwithstanding the constant flow of emigrants from the old world; and I believe there is no country where the means of religious and moral improvement are so abundantly provided—where facilities of education are more within the reach of all, or where there is less of extreme poverty and destitution. As morals have an intimate connexion with politics, I do not think it out of place here to record my conviction, that the great principle of popular control, which is carried out almost to its full extent in the free states, is not only beautiful in theory, but that it is found to work well in practice. It is true that disgraceful scenes of mob violence and Lynch law have occurred, but perhaps not more frequently than popular outbreaks in Great Britain; while, generally, the supremacy of law and order have been restored without troops, or special commissions, or capital punishments. It is also true that these occurrences are, for the most part, directly traceable, not to the celebrated declaration of the equal and unalienable right of all men to life, liberty, and the pursuit of happiness, which is the fundamental principle of the constitution, but to the flagrant violation of that principle in the persons of the coloured population, of whom those in most of the free states are actually or virtually deprived of political rights; and the rest, constituting a majority of the population in some of the southern states, are held in abject slavery."

To this we have nothing to add, but that the slavery of the southern states of America and elsewhere will not be got rid of by frantic projects such as have lately proved abortive, but by plans devised on principles of common sense, peaceful suasion, and a reasonable allowance of time to permit prejudices to be weakened and ultimately removed.

THE PHILOSOPHICAL SHOWMAN.

Carswell House, in which I have now resided for upwards of seven years, is a prettily situated mansion. It stands on the brow of a gentle declivity, and overlooks a wide extent of beautiful country. The view from our parlour windows in the summer season, when the woods are green, and the fields clothed in verdure, is delightful. It must be allowed, however, that we are rather dreary in winter. The house is somewhat solitary, and the snow, which falls heavily, lies long and deep around it. At about a quarter of a mile from the house passes a cart-road leading to the village of Limburne, about five miles distant, and of this road a stretch of about a mile lies in view of our windows.

It was on a wild snowy day in the month of January last year, that one of my youngsters, who was standing at a window looking at the drift which was whirling past in thick and blinding clouds, called my attention to the figure of a man on the road, who, though still struggling with the storm, seemed ready every moment to sink beneath its violence. He appeared unable to make any way against the suffocating drift; and this the less readily that he bore, as we could discern, a heavy burden on his back.

Seeing the man's distress, I dispatched my gardener and footman to his assistance, desiring them to conduct him to the house, in which I meant he should remain until the storm had somewhat abated. In less than half an hour the man was comfortably seated by our kitchen fire, and proved to be an itinerant showman. He was an Italian, and the burden which we had observed upon his back was his show-box. Grateful for the kindness shown him—which kindness included of course the refreshments required by his condition—the poor Italian sent up a respectful message to the dining-room, to the effect that he would be happy to exhibit his show to the younger members of the family, if they would so far honour him. He was immediately requested to come up stairs, and to bring his show along with him.

I was much struck with the man's appearance on his entering the room, which he did with a remarkably graceful bow. His countenance had the swarthy hue of his country, and his dark eye all the fire and brilliancy that belong to the eyes of the children of the sunny south. But there was an expression of mildness and intelligence in his countenance not so often seen, and which at once attracted my attention.

Having placed his show-box—a tasteful thing, beautifully painted and gilt—in a proper situation, he withdrew the slides from the lenses, wiped them carefully, and placing himself at one end of the box, in order to work the tableaux, or pictures, he invited us, with a polite bow and pleasant smile, to take our places at the sights, of which there were in all six.

Before drawing the cord which was to exhibit the first picture to us, the Italian made a short speech in broken but perfectly intelligible English, the substance of which was—That his exhibition differed from all other exhibitions in the show way; that there was little in what he had to exhibit to gratify the eye as mere spectacle, but a good deal, he hoped, to strike the imagination, and perhaps improve the mind; that, in short, his was a philosophical exhibition, the material being taken from human life.

Having taken our places at the glasses, the Italian drew a cord, when there was presented to us the figure—picture, I presume it was, but so admirably painted, so life-like, so finely relieved, that it seemed a beautiful statue—of a child, a lovely boy of between three and four years of age. We all uttered an involuntary exclamation of delight on beholding this fair child; his look was so innocent, so playful; his brow so open and sunny; the smile on his beauteous countenance so full of sweetness and childish simplicity.

"Is not that a lovely child?" said the Italian. "Saw you ever such a picture of innocence? Saw you ever human countenance so utterly free from all expression of evil—from all indications of the darker passions of human nature? Does he not seem, in truth, a very angel? You cannot believe it possible—nay, it surely *is* not possible—that so guileless and innocent a being should ever become a cruel, ruthless, blood-thirsty savage."

"No, no," we all exclaimed; "it cannot be. It is impossible."

At this instant, click went one of the cords of the show-box. The picture of the child disappeared, and what is called a battle-piece occupied its place. In the foreground, a body of cavalry was making desperate havock amongst the remains of an army which had just been broken and put to flight. The leader of the charging party was himself employing his sabre with merciless activity, not scrupling to cut down even those who supplicated his mercy, or whose wounds disabled them for flight or resistance. His countenance manifested that excitement which accompanies the exercise of the more violent passions.

"Have you ever seen *that* man before, my kind friends?" said the Italian, with a gentle but significant smile.

We all declared we had not.

"Ah! my good friends, but you have," he said, laughing. "That ruthless warrior is no other than the beautiful and innocent child, grown to man's estate, whom you a little while since so much admired."

Click, again, went the cord of the show-box, and a splendid pageant took the place of the battle-piece. The scene was the interior of a noble Gothic hall, hung with rich tapestry, and blazing with the light of a thousand wax candles in silver sconces. Along the centre of the hall ran a long table, loaded with the most costly viands in gold and silver vessels. At this table sat a multitude of persons, male and female, splendidly attired. At a small table, at the farther end of the hall, and raised upon a dais, sat a lordly-looking personage, arrayed in sumptuous robes, and wearing on his head a crown of gold sparkling with precious stones. By his side sat a fair young lady, on whom all eyes seemed bent in wonder and admiration, and on whom her lordly companion appeared gazing with inexpressible fondness. As became a creature of such surpassing loveliness, she, too, was magnificently attired, while behind and around her chair stood a crowd of attendants, ready to obey her slightest wish. It seemed, in truth, as if the air of heaven would not be permitted to breathe too rudely on that exquisitely beautiful form.

We were all struck with admiration of this splendid scene, especially with the extraordinary beauty and sumptuous attire of the young lady who sat beside the king, and now inquired who the former and latter were. The Italian told us that the king was Edward IV.; the lady who sat beside him the celebrated Jane Shore. We were about to ask some other questions, when click, again, went the string of the box, and a dreary, monotonous view of frost-bound ponds and fields, and leafless trees, with a large city in the distance, which we subsequently learnt was London, was presented to our view. In the foreground of the picture, which it made one cold and chilly but to look at, was the figure of a miserable old woman, haggard and wrinkled with poverty and age, gathering sticks for firewood. Her clothes were in rags, and she seemed as if perishing with cold and hunger.

"Have you, my kind benefactors," said the Italian, as on a former occasion—"have you, think you, ever seen that miserable old woman before?"

We all declared we had not.

"Ah! wrong again," replied the Italian, with one of his gentle and intelligent smiles. "You *have* seen her. What will you think, now, when I tell you that that starving, wretched, repulsive, old woman, who is searching the leafless hedges for withered sticks wherewith to make a fire to warm her aged limbs, and the beauteous young lady whom you saw seated beside royalty, surrounded with all the pomp and adulation of a regal court, are one and the same person. It is so. And yet, extreme as the transition is, it is not the work of fancy. It is not the conception of an idle brain; it is an incident from real life. That miserable old woman is Jane Shore; and such, we all know was her unhappy end."

Again the string was drawn. And now the interior of an apartment of moderate size, and otherwise such as are seen in the houses of the more respectable of the middling classes, was exhibited. It was filled with company, all apparently dressed for the occasion, and seemed to be the scene of some joyous revelry—every countenance beaming with a mirth and glee which, we might conjecture, was, in part at least, inspired by the profuse display of good cheer which the ample table board around which the guests were seated exhibited.

We could not, at first, make out any special purpose for this merry-making. But, at length, descrying a jolly-looking dame, who struck us at once as presenting what we may call the characteristics of a nurse, bearing about with an air of triumph a gaily-dressed and smiling babe in her arms, we made out that it was a christening. On a small brooch or clasp, which united in front a broad band or cincture that begirt the infant, the artist had inscribed, in very small, almost invisible letters, the words, "Edward Marston, aged three weeks."

Again the string was drawn, and another apartment, similar to the above described, was exhibited; but how differently occupied. It was filled with mourners, and on a table or tressel in the centre lay a coffin. It was still unclosed, and we could see that it contained the body of an old man. His ghastly, withered countenance, and pinched features, were uncovered, and on the metal plate of the coffin lid, which lay close by, we read, "Edward Marston, aged 72 years." The figure which we now contemplated was, then, the smiling cherub of the preceding picture. Where now were the members of that merry company, whom we saw assembled to welcome his admission within the pale of the church? One after another, they have all long since descended into the grave; and *he*, too, is now about to follow. His term of life has run out. It was a long one; but at its close it seemed to have passed almost as quickly as the transition of the two pictures.

"Now, my kind benefactors," said the Italian, "let us see what is doing in the mansion adjoining this house of mourning."

He drew the string, and a brilliantly lighted apartment, filled with a gay assembly, presented itself. The centre of the floor was occupied by a crowd of light-footed dancers, and mirth and revelry held unrestrained dominion over the scene.

"It is the celebration of a marriage," said the Italian. "Look to the right, and you will see the bride and bridegroom standing together. That is she, the fair young girl in the white satin dress. See how beautiful she is; how elegant her form! That tall and graceful young man, on whose arm she so fondly leans, is her husband. How happy he looks! He has no thought for the future. His whole soul, his every sense, is wrapt up in the present; he dreams not that all this happiness and joy will speedily pass away."

And, at this instant, away like thought passed the joyous scene, and another took its place. It was a fair garden; and on one of its rustic seats sat an old lady, dressed in the deepest mourning of widowhood. Her aged countenance was sad and melancholy. A long staff, with an ivory head, which stood beside her, showed that she could not walk without such aid. Around her sported three or four young children; on the golden head of one of whom rested one of her long, thin, withered, and palsied hands. She seemed as if blessing the child.

"Know ye who that feeble old woman is?" said the Italian.

"We guess," said we; for we now fully understood the nature and scope of his exhibition.

"Right," he replied, satisfied that we did know who she was. "That ancient dame, who cannot totter along without the support of a staff, is no other than the fair young bride of the preceding picture. Her husband, the gay and graceful youth whom you saw by her side, has been long dead, and these bright-haired children who are sporting around her are her grand-children. Thus goes the world on."

Once more the string was drawn, and a splendid mansion presented itself to view. A little, ragged, shivering boy, who seemed to have been soliciting charity, was being thrust rudely from the door by a pompous, over-fed menial, who held a stick over him in a threatening attitude. The Italian bade us mark the little ragged boy well. We did so. He drew the string, and the same mansion was again presented to our sight. But it had undergone many changes. Additions had been made to it here and there. New doors and windows had been struck out, and other prominent features altered. The grounds around the building, too, had undergone change; trees grew where there had been none before; and where there had, they had been cut down. Altogether, the painter, if picture it was, had so contrived it, that, on comparing the appearances of the mansion in the two paintings, a distinct impression was conveyed of the lapse of an interval of many years. A little way from the door of the house in the picture we were now contemplating, a gentleman, seemingly the proprietor, was about to get into a carriage. An old mendicant on crutches, with hat in hand, his grey locks streaming in the wind, stood a little apart, as if in the act of imploring his charity. The appeal did not appear to be made in vain. The gentleman, with a look of great benevolence, was putting something into his hand.

The Italian now questioned us as before. "Know ye," he said, "who that gentleman is, and who that poor old man who is soliciting his charity, and, as you see, not in vain? That gentleman, my kind friends," he went on, "is the poor boy who was turned from the door of the mansion thirty years since, and he who is now appealing to his benevolence is the same with him who drove him away—such are the extra-

ordinary changes which are constantly taking place in human affairs, often from heedlessness, or, perhaps, wilful extravagance, on the one hand, and perseverance with self-denial on the other."

Here dinner being announced, we were reluctantly compelled to desist, for the time, from further gratifying our curiosity with these pictures of life. But as there was no appearance of the storm abating, and as I in consequence had offered the Italian quarters for the night—an offer which he gratefully accepted—we engaged him to renew his interesting exhibition in the evening; he having informed us that we had yet seen but a very small portion of what he had to show.

A FEW WEEKS ON THE CONTINENT.

VISIT TO HOFWYL.

Hofwyl, situated at the distance of from six to eight English miles from Berne, was one of those places which had formed a principal object of my visit to Switzerland—a visit which, it will have been perceived, was rather less to scramble over ice at the height of ten thousand feet, than to see nature in her more charming moods, and to observe something of the character and features of Swiss society. No one taking the slightest interest in education and its progress, could visit Berne without seeing the far-spoken-of establishment of M. de Fellenberg, more particularly since it is open to the inspection of strangers from all quarters of the world. It was not therefore surprising that I made it the object of a special side excursion.

Hiring a voiture on purpose for the day, we proceeded from Berne in a northerly direction, and passed for several miles through a rich agricultural tract, well clothed with tall timber, and evidently the property of a class of persons above the usual standing of cottage farmers. The fields had been cleared of their autumnal produce; ploughs were here and there seen turning over the furrows preparatory for new crops; and at the doors of the large thatched homesteads of the farmers, clusters of women were busy skutching flax, with the customary energy and clacking noise with which that occupation is performed. Passing through these pleasing scenes of rural comfort and industry—or, I should almost say, hard labour, for hard it would be to English females—our carriage at length entered a more undulating stretch of country, and made the best of its way through a pretty thick wood. On emerging from the cool shade of the overhanging trees, we had before us an open tract, in the midst of which, on the top of a gently rising ground, stood Hofwyl—a situation apparently unmatchable in point of salubrity and beauty, for all around, the cleared fields descend to distant vales and meadows, which are backed by sheltering hills and woods; and from various parts of the grounds are seen the long ridgy peaks of the Bernese Alps. A few minutes served to carry us up to the place, where we were received with the greatest politeness and attention by M. de Fellenberg, one of the most venerable men whom it was ever my fortune to meet; and his son, a young gentleman who is now taking a large share of the burden of the establishment. As it is my desire to give as exact an idea as possible of Hofwyl and the plans of its proprietor, I hope to be excused for going a little into detail.

M. de Fellenberg is by birth a Swiss, having been born in the canton of Berne, in the year 1771. His immediate ancestors were of the patrician or privileged class, which late events have levelled with the ordinary citizens of the country; by the mother's side, he is a descendant of the Dutch admirals Cornelius and Van Tromp. The excellent example and admonitions of his parents had a happy influence upon his early years, and induced that strong devotion to the interests of his country and of mankind at large which has distinguished him through life. While still a young man, he had the sagacity to form the conclusion that no species of political reform in the affairs of Switzerland could be of any use unless preceded by a reform in education. To satisfy himself on this point, he travelled all over Switzerland, the Tyrol, and Germany on foot, everywhere acquainting himself with the state of the people, residing in the villages and farm-houses, and mingling in the labours and hearing the sentiments of the peasants. On the invasion of Switzerland by the French in 1798, he took an active part in opposing them, was proscribed, and fled to Germany. He was soon after recalled to his native country, and employed on a political mission to the French Directory; but the prevailing disregard of all principle gave him a distaste of diplomacy, and he resigned his office. He then filled a public station at home, and, fully impressed with the belief that the only resource against the revolutionary horrors he had witnessed was to be found in education, he resolved to devote his life to this object. He was appointed a member of the Council of Education; but finding little was to be done by those with whom he acted, he threw off all connexion with the government, and determined to form on his own estate of Hofwyl, and with his own fortune, an institution, to prove practically what could be done, by a right system of education, for the benefit of humanity.

Such was the principle on which M. de Fellenberg started as an educationist about forty years ago, and we have now to say something of his operations. His plans were comprehensive and full of benevolence. He purchased and added about two hundred acres of land to his estate, which must have been originally small, his object being not only to improve the knowledge of agriculture in the district, but to make lessons in industrial affairs a means of moral training. He began, therefore, by establishing an agricultural school, which he formed of the destitute children of the canton. To this, after a time, he added a school for youths from the higher classes of society. And, lastly, he formed an intermediate school of boys, chiefly the sons of farmers who were able to pay a small board. His scheme was gone about with great caution and deliberation; for his object being the formation of character, it was absolutely necessary that new comers should be admitted only after the previous pupils had been to a certain extent fixed in principle. This was a wise resolution, which it would be well for teachers in general to copy, as large accessions of raw lads at one time are apt to derange the whole economy of an educational establishment, and undo much of the advantages already gained.

After a course of constant improvement for nearly forty years, we now find the establishment of Hofwyl complete in all its details—the edifices constituting the schools and dwelling-houses settled into the character of a quiet orderly village, and the fields, for half a mile round, trimmed with the same skill and neatness as you would see in East Lothian or Norfolk. The buildings stand on the most elevated part of the estate, and are of a respectable appearance, each several storeys in height. On entering an open play-ground, we have, on the right, the largest building, in which M. de Fellenberg and his family, and also the higher class of pupils, reside, and in which also are some of the class-rooms. On the lower or sunk floor are the kitchen and cellars; the floor above contains a large dining-room, chapel, and other apartments; on the next floor are the class-rooms; and the top storey is laid out in two large sleeping apartments, with a row of beds on each side—the whole clean and neat in the extreme. Each boy occupies a separate bed, and the whole are superintended by masters, whose apartments are adjoining. The boys are never alone, so that none has the power of either domineering over or contaminating his companions. All rise at 5, and breakfast at 6 o'clock in summer, and at 6 and 7 in winter.

From this large and commodious building we were conducted to a house of more plain appearance across the play-ground, the lower part of which we found to be occupied as a museum and a receptacle for garden tools; in the floor above was a cabinet-making shop, where several young gentlemen were at the time engaged in making articles according to their own taste, under the direction of a professed workman. Passing a place for gymnastic exercises, we now went to the house containing the intermediate classes, at which, in a lower hall, eighty lads were at the time at dinner, under the superintendence of their masters. Next, we adjourned to the extensive suite of buildings connected with the dairy and operations of the farm, which stood on the northern slope, and a little aloof from the main cluster of the establishment. Here a most extensive system of rural management was disclosed to us. In a series of lower offices stood seventy-two cows, beautiful large animals, which I was told were occasionally, for the sake of exercise, employed in drawing the plough—a practice to which nothing could reconcile either the ladies of the party or myself. In the upper part of the cow-house was a barn of immense size; and in a neighbouring loft we were shown a large array of agricultural implements, quite new, and ready for use—the preparation of these articles on the most improved plan forming a part of M. de Fellenberg's widely comprehensive schemes. The dairy, the places of residence of the boys of the lower school, and other departments, were shown, but require no notice. After seeing every thing here, we were led by a pathway down the sloping field to a pond 90 feet in diameter, neatly paved, and surrounded by a tall hedge, with a dressing-house. The water is kept ever fresh by a spring. This is the bathing pond for the boys, and here they learn to swim.

We were conducted over these various outlying parts of the establishment by young M. de Fellenberg, who has been in England, and clearly explained every thing to us in our own tongue. Returning with him to the *grande maison*, we again sat down by the side of the venerable founder of the institution; and what betwixt his own and his son's observations, I really believe little was left to be told. The manner and conversation of M. de Fellenberg were exceedingly pleasing. In his appearance is embodied all that we can conceive of an estimable old man—a most benevolent cast of countenance, silver white hair, and the sober dress of a recluse. He spoke in French, and so slowly and distinctly that there was no mistaking his meaning. German is the common language in this part of Switzerland, and is therefore used in the schools; but French and English are taught to those who desire them. At the period of my visit, the whole establishment included about 150 boys, of whom from 50 to 60 belonged to the high school, 80 to the intermediate, and the remainder to the lower or agricultural school. With respect to the latter, their schooling is on a very moderate scale; but they are taken gratuitously, and their labour, such as it is, compensates for their board and instruction. The boys of the intermediate school are taught on a more advanced plan, but with reference to ordinary professions, including agriculture, and are boarded in a plain manner, conformable to the moderate sum paid for their attendance. The pith of the whole concern is the high school; the pupils are taught by the best masters, and I should certainly say that the principle of their education is unexceptionable, for it refers alike to physical, intellectual, and moral training. Among other accomplishments, vocal music is taught upon scientific principles to all, and instrumental music to those whose taste inclines. Lessons in music being also given in the lower schools, at times there are meetings in which all join in concert. An English lady, who has three boys at the institution, and to whom I have been indebted for a candid statement of what she saw and felt during a pretty lengthened visit, says, in a communication to me on the subject—"The pupils of the intermediate school sing in parts with a perfection rare among children; and I was never more touched by music, than when, early on a Sunday morning, their voices broke the universal stillness. There is a monthly concert on a Sunday evening. The night I was present the audience consisted of more than two hundred persons, formed of the pupils of the three schools and their masters, who took no part in the performance, also M. de Fellenberg, his daughters, and grand-children, and servants of the whole establishment. The orchestra was composed of violins, violoncello, double bass, trombone, clarionet, flute, and French horn. The pieces played were those of Haydn, Neukomm, Rossini, and other leading composers. The audience were very attentive, but did not applaud, as M. de Fellenberg conceives the young have not sufficient judgment to pronounce an opinion publicly. After the concert, the performers were invited publicly to the saloon, and partook of refreshments. I may here mention that the part taken by M. de Fellenberg's daughters is most valuable. Their mother died about three years since. She gave them the example of an undeviating co-operation in the views and practical details of their father's philanthropic designs. They all speak English, and their maternal kindness and care of the young children are beyond all praise. They are elegant and accomplished women, uniting the simplicity of Swiss habits with intellectual refinement. In the winter, the pupils visit the saloon in turn, twice a-week, and also join the domestic circle of the head master and his wife. Thus, Hofwyl unites the advantages of public with domestic education in a manner unknown in any other institution."

It is customary in some of the best continental boarding-schools for the boys to proceed on excursions annually with their masters; and this is particularly attended to at Hofwyl. A certain number of boys are placed under the charge of a trusty master, and set out on a tour in the month of August, in a direction previously determined. The journey is on foot, and each carries a knapsack, furnished with a few articles of clothing. Thus the squad march over hill and dale, visit places of historical interest, picturesque scenes, ruins of old castles, and towns of commercial note. It need hardly be mentioned that these journeys, which last for several weeks, are of great use in opening up the minds of the youths, independently of the advantages which may be derived from physical exercise. A boy at a school of this liberal kind, in the course of a few years, has perambulated the north of Italy, the Tyrol, a portion of Germany, and best part of Switzerland, and is able to converse in several languages; while a boy at an English boarding-school has seen nothing, can with difficulty translate a few words of Latin, and speak only his own vernacular tongue.

I learned from M. de Fellenberg that he has taken every possible care to surround the institution with a pure moral atmosphere, to exclude evil influence and example, and thus, as far as possible, control whatever evil passions the pupil may naturally possess. Boys who are restive under the mild system of discipline which is established are removed. It is not every one who will be admitted. The place is not a reformatory or penitentiary; neither is it a place in which there is any attempt at proselytising. In the course of religious instruction, nothing beyond the general principles of Christianity are taught; and on Sunday, the boys of each sect attend chapel at certain hours, when a clergyman of their own creed is in attendance. The chapel is a large apartment, which we were shown in making the round of the premises. It is plainly furnished with benches, and has at one end an object which I took to be a closed cupboard; pointing to it, M. de Fellenberg observed that it was "*l'autel pour la messe*," which was shut up when the place was used for the reformed worship. Notwithstanding the presence of this dangerous piece of furniture, there never has been known an instance of a conversion to Roman Catholicism in the school, neither has there been an instance of a change from Roman Catholicism to Protestantism. M. de Fellenberg is not a propa-

gandist; and his liberal and judicious arrangements for each set of boys being brought up in the religion of their parents, shows that he is any thing but a bigot.

The plans of this amiable philanthropist may be said to be much ahead of the age in which he lives. He has formed conceptions of the moral improvability of the human species which do not seem to enter the minds of ordinary instructors. The object of ninety-nine in the hundred of persons assuming the education of youth, is little more than to impart a certain routine of instruction. They have not the most remote idea of elevating the moral character—cultivating and purifying the innermost thoughts of the child. Fellenberg aims at making the very most of the being committed to his charge—training him to be a really good as well as highly intelligent man. For this end, besides excluding evil influence and example, he surrounds the pupil with what will allure and stimulate him to good; but without resorting to the principle of emulation, or holding out the offer of prizes and honorary distinctions, which he considers injurious to sound morals. When new pupils arrive, they find themselves in the midst of a busy little world; they perceive industry and occupation accompanied by enjoyment; they soon acquire a love of intellectual and moral exercise for their own sake; and gradually falling into the stream of duties, in turn exert an influence on others. But though apparently left to act as free agents, they are individually under constant supervision; the effects of circumstances on their bodies and minds are observed; evil propensities are restrained, and every thing is done to inspire confidence, self-control, and that self-approval which is ever the reward of good conduct.

I believe I should only tire the reader by saying any thing more respecting Hofwyl. I ought to speak with diffidence, as I spent only a few hours within the walls of the institution; and before pronouncing an opinion, ought to have followed the plan of an Irish nobleman who lately went to the establishment, like myself, for a forenoon, but was so delighted with all he saw that he stayed six months. My impression is, that the class instruction and physical and moral training at Hofwyl are of the first order; at all events, I never saw any thing to compare with it in England: and I am assured by those who have children in the institution—persons who know what education should be—that it is all they could wish. How far M. de Fellenberg has realised the views on which he originally set out, is a different question. I rather think he has been disappointed. The bulk of the Swiss, as I mentioned on a former occasion, are a set of hard-working peasant farmers. They are diligent, frugal, and virtuous, but their minds are contracted. The offer of M. de Fellenberg to educate their children has never been accepted of with hearty approbation or thanks. Their plan of rearing a family consists in making their children contribute a share to the general means of subsistence. A child of four years can tend a goat; a boy of twelve can handle a spade. The whole scheme of operations in Switzerland is to take out of every living being all the work he or she can produce to the general stock. Against such mean ideas of the value of juvenile labour, M. de Fellenberg could not possibly contend. The offer to a parent to educate his child was equivalent to asking him to part with a servant; and it was imagined that the offer was made only for selfish purposes. Consequently, the lower department of the institution has been the least successful; still, it has sent out a considerable number of lads well skilled in husbandry on the most approved models, and that is something done for the great outfield of ignorance. The intermediate school has been a degree more successful, and is generally well attended. It must likewise have had a beneficial effect in scattering throughout the middle order of society many young men impressed with proper notions of trade, agriculture, and social organisation. The strength of the institution appears to have centered in the upper school, which is attended by gentlemen's sons from Germany, and some other countries to which the fame of the institution has spread, including Switzerland. There are a few young gentlemen from England. The plan of uniting in one establishment three boarding-schools of different grades, appeared to me objectionable, and I imagine it would scarcely answer in England. I learned, however, that it has never been attended with the collisions I anticipated; and that when all the various boys happened to assemble, there was nothing like arrogant superiority on the one hand, or inferiority on the other, but that all was perfect harmony between them.

The world in general, condemning what it cannot understand, or which does not fall in with its own prejudices, has, I believe, not hesitated to hold up M. de Fellenberg as a charlatan, and his schemes as at best idle dreams. That this character is unjust, I have no hesitation in saying. He may not have realised all his intentions; but these intentions were sincere, and he has at least sacrificed a lifetime in endeavouring to carry them into effect. Local circumstances, as I have hinted, have not a little hampered his views; but he has clearly made an impression in the educational arrangements of his country; and, by the model which he has presented of a farm cultivated on the best principles of science and art, his exertions have proved of great value to the agriculture of this part of the continent. Persons, also, who have been trained up at his seminary have gone forth and established industrial schools on a similar model in different parts of Switzerland and Germany; and thus the benevolent designs of the founder of Hofwyl are likely, at a future day, to be fully carried out.

We parted from M. de Fellenberg's family not without regret, and returned slowly to Berne, pondering on the many agreeable sensations which had been experienced on our visit.

POPULAR ENGLISH FESTIVALS.

MAY-DAY.

A SOUND of laughing villages comes over the imagination at the very name of May-day. This, in times when festivals were real observances of the people, was one of the most signally and cheerfully kept, although it has not the least trace of Christianity about it, but may be said to be Pagan all over. The celebration of May-day must have been prompted by nature herself: the time of the young flower and leaf, and of all the promise which August fulfils, could not but impress the minds of the simplest people, and dispose them to joyful demonstrations in word and act. The sun, as the immediate author of the glories of the season, was now worshipped by the Celtic nations under the name of Baal; hence the festival of *Beltein*, still faintly observed in Ireland and the Highlands of Scotland. Even in Ayrshire, they kindled Baal's fire in the evening of May-day, till about the year 1790. The Romans held games called Floralia, at which there was great display of flowers, and where women danced, if we are to believe Juvenal, only too enthusiastically. The May-day jollities of modern Europe seem to be directly descended from the Floralia.

In England, we have to go back a couple of hundred years for the complete May-day; since then it has gradually declined, and now it is almost extinct. When it was fully observed, the business of the day began with the day itself, that is to say, at midnight. We have the authority of Shakspeare, that with the populace of England it was impossible to sleep on May morning. Immediately after twelve had struck, they were all astir, wishing each other a merry May, as they still, at the same hour on the first of January, wish each other a happy new year. They then went forth, with music and the blowing of horns, to some neighbouring wood, where they employed themselves in breaking down and gathering branches. These they brought back at an early hour, and planted over their doors, so that by daylight the whole village looked quite a bower. The citizens of London went a-Maying in this fashion, notwithstanding their comparative distance from woods. They went marshalled in parishes, or in unions of two or three parishes; their mayor and aldermen went also; and we read of Henry VIII. and Queen Catherine riding from Greenwich to Shooter's Hill, attended by lords and ladies, to join in the sport. In some places, the Mayers brought home a garland suspended from a pole, round which they danced. In others, and this was a more general custom, there was an established May-pole for the village, which it was their business to dress up with flowers and flags, and dance around throughout all the latter part of the day. A May-pole was as tall as the mast of a sloop of fifty tons, painted with spiral stripes of black and white, and properly fixed in a frame to keep it erect. Here lads and lasses danced in a joyful ring for hours to the sounds of the viol, and masquers personating Robin Hood, Little John, Maid Marian, and others of the celebrated Sherwood company of outlaws, as well as morris-dancers, performed their still more merry pranks. May-poles, as tending to encourage levity of deportment, were condemned by the puritans in Elizabeth's time; James I. supported them in his Book of Sports; they were altogether suppressed during the time of the Commonwealth, but got up again at the Restoration. Now, change of manners has done that which ordinances of parliament could not do. This object, so interwoven with our national poetical literature, is all but rooted out of the land. Washington Irving speaks of having seen *one* in the earlier days of his acquaintance with England—probably twenty-five years ago. "I shall never," he says, "forget the delight I felt on first seeing a May-pole. It was on the banks of the Dee, close by the picturesque old bridge that stretches across the river from the quaint little city of Chester. I had already been carried back into former days by the antiquities of that venerable place, the examination of which is equal to turning over the pages of a black-letter volume, or gazing on the pictures in Froissart. The May-pole on the margin of that poetic stream completed the illusion. My fancy adorned it with wreaths of flowers, and peopled the green bank with all the dancing revelry of May-day. The mere sight of this May-pole gave a glow to my feelings, and spread a charm over the country for the rest of the day; and as I traversed a part of the fair plains of Cheshire, and the beautiful borders of Wales, and looked from among swelling hills down a long green valley, through which 'the Deva wound its wizard stream,' my imagination turned all into a perfect Arcadia. I value every custom that tends to infuse poetical feeling into the common people, and to sweeten and soften the rudeness of rustic manners, without destroying their simplicity. Indeed, it is to the decline of this happy simplicity that the decline of this custom may be traced; and the rural dance on the green, and the homely May-day pageant, have gradually disappeared, in proportion as the peasantry have become expensive and artificial in their pleasures, and too knowing for simple enjoyment. Some attempts, indeed, have been made of late years, by men of both taste and learning, to rally back the popular feeling to these standards of primitive simplicity; but the time has gone by—the feeling has become chilled by habits of gain and traffic—the country apes the manners and amusements of the town, and little is heard of May-day at present, except from the lamentations of authors, who sigh after it from among the brick walls of the city."

It is not unworthy of notice that the late Dr Parr was "a patron of May-day sports. Opposite his parsonage house at Hatton, near Warwick, on the other side of the road, stood the parish May-pole, which on the annual festival was dressed with garlands, surrounded by a numerous band of villagers. The doctor was 'first of the throng,' and danced with his parishioners the gayest of the gay. He kept the large crown of the May-pole in a closet of his house, from which it was produced every May-day, with fresh flowers and streamers preparatory to its elevation, and to the doctor's own appearance in the ring. He always spoke of this festivity as one wherein he joined with peculiar delight to himself and advantage to his neighbours."*

A certain superstitious feeling attached to May-day. The dew of that morning was considered as a cosmetic of the highest efficacy, and women, especially young women, who are never unwilling to improve in this respect, used to go abroad before sunrise to gather it. To this day, there is a resort of the fair sex every May-morning to Arthur's Seat, near Edinburgh, for the purpose of washing their faces with the dew. Mr Pepys, in his curious diary written in the time of Charles II., gravely tells us of his wife gone to Woolwich for a little air, and to gather May-dew, "which Mrs Turner hath taught her is the only thing in the world [Rowland's Kalydor not being then invented] to wash her face with." Scott, in his "Discovery of Witchcraft," speaks of a sprig of hawthorn gathered on May-day, and hung in the entry to a house, as a presumed preservative against all malign influences. We find another quaint superstition as to May-day in Gay's "Shepherd's Week:"—

> "Last May-day fair, I search'd to find a snail
> That might my secret lover's name reveal.
> Upon a gooseberry-bush a snail I found,
> For always snails near sweetest fruit abound.
> I seized the vermin; home I quickly sped,
> And on the hearth the milk-white embers spread:
> Slow crawl'd the snail, and if I right can spell,
> In the soft ashes mark'd a curious L.
> Oh! may this wondrous omen lucky prove,
> For L is found in Lubberkin and Love."

There was also a practice of making fools on May-day, similar to what obtains on the first of the preceding month. The deluded were called *May-goslings*. It was held unlucky to marry in May, a notion which, we learn from Ovid, existed among the Romans.

A gentleman residing at Hitchin, in Hertfordshire, communicated to Mr Hone a curious account of the way in which May-day is observed at that place. The Mayers there express their judgment of the estimableness of the characters of their neighbours by fixing branches upon their doors before morning; those who are unpopular find themselves marked with nettle or some other vile weed instead. "Throughout the day, parties of these Mayers are seen dancing and frolicking in various parts of the town. The group that I saw to-day, which remained in Bancroft for more than an hour, was composed as follows:—First came two men with their faces blacked, one of them with a birch broom in his hand, and a large artificial hump on his back; the other dressed as a woman, all in rags and tatters, with a large straw bonnet on, and carrying a ladle: these are called 'Mad Moll and her husband.' Next came two men, one most fantastically dressed with ribbons, and a great variety of gaudy-coloured silk handkerchiefs tied round his arms from the shoulders to the wrists, and down his thighs and legs to the ankles; he carried a drawn sword in his hand; leaning upon his arm was a youth dressed as a fine lady, in white muslin, and profusely bedecked from top to toe with gay ribbons; these, I understood, were called the 'Lord and Lady' of the company. After these followed six or seven couples more, attired much in the same style as the lord and lady, only the men were without swords. When this group received a satisfactory contribution at any house, the music struck up from a violin, clarionet, and fife, accompanied by the long drum, and they began the merry dance, and very well they danced, I assure you; the men-*women* looked and footed it so much like *real* women, that I stood in great doubt as to which sex they belonged to, till Mrs J—— assured me that women were not permitted to mingle in these sports. While the dancers were merrily footing it, the principal amusement to the populace was caused by the grimaces and clownish tricks of Mad Moll and her husband. When the circle of spectators became so contracted as to interrupt the dancers, then Mad Moll's husband went to work with his broom, and swept the road dust all round the circle into the faces of the crowd; and when any pretended affronts were offered (and many were offered) to his wife, he pursued the offenders, broom in hand; if he could not overtake them, whether they were males or females, he flung his broom at them. These flights and pursuits caused an abundance of merriment."† The

* Hone's Every-Day Book. † Ibid.

Hitchin Mayers have a song much in the style of a Christmas carol, which Mr Hone has also given :—

"Remember us, poor Mayers all,
And thus do we begin
To lead our lives in righteousness,
Or else we die in sin.

We have been rambling all this night,
And almost all this day;
And now, returned back again,
We have brought you a branch of May.

A branch of May we have brought you,
And at your door it stands;
It is but a sprout,
But it's well budded out
By the work of our Lord's hands.

The hedges and trees they are so green,
As green as any leek;
Our heavenly Father he watered them
With his heavenly dew so sweet.

The heavenly gates are open wide,
Our paths are beaten plain,
And if a man be not too far gone,
He may return again.

The life of man is but a span,
It flourishes like a flower;
We are here to-day, and gone to-morrow,
And we are dead in an hour.

The moon shines bright, and the stars give a light,
A little before it is day;
So God bless you all, both great and small,
And send you a joyful May!"

In London, as has been said, May-day was once as much observed as it was in any rural district. There were several May-poles throughout the city, particularly one near the bottom of Catherine Street in the Strand, which, rather oddly, became in its latter days a support for a large telescope at Wanstead in Essex, the property of the Royal Society. The milkmaids were amongst the last conspicuous celebrators of the day. They used to dress themselves in holiday guise on this morning, and come in bands with fiddles, whereto they danced, attended by a strange-looking pyramidal pile, covered with pewter plates, ribbons, and streamers, either borne by a man upon his head, or by two men upon a hand-barrow: this was called their *garland*. The young chimney-sweepers also made this a peculiar festival, coming forth into the streets in fantastic dresses, and making all sorts of unearthly noises with their shovels and brushes. The benevolent Mrs Montagu, one of the first of the class of literary ladies in England, gave these home slaves an annual dinner on this day, in order, we presume, to aid a little in reconciling them to existence. In London, May-day still remains the great festival of the sweeps, and much finery and many vagaries are exhibited on the occasion.

The Robin Hood games and morris-dances, by which this day was distinguished till the Reformation, appear, from many scattered notices of them, to have been entertainments full of interest to the common people. Robin has been alternatively styled in at least one document as the King of May, while Maid Marian seems to have been held as the Queen. The various scattered particulars respecting these festivities, which make but dry reading by themselves, have been wrought up to some advantage by Mr Strutt in his "Queen Hoo Hall," where he describes May-day as celebrated by the servants and dependants of an English baron of the fifteenth century. (We abridge a little in the matter of costume.) "In the front of the pavilion, a large square was staked out, and fenced with ropes, to prevent the crowd from pressing upon the performers, and interrupting the diversion; there were also two bars at the bottom of the enclosure, through which the actors might pass and repass, as occasion required. Six young men first entered the square, clothed in jerkins of leather, with axes upon their shoulders like woodmen, and their heads bound with large garlands of ivy leaves, intertwined with sprigs of hawthorn. Then followed six young maidens of the village, dressed in blue kirtles, with garlands of primroses on their heads, leading a fine sleek cow decorated with ribbons of various colours interspersed with flowers; and the horns of the animal were tipped with gold. These were succeeded by six foresters equipped in green tunics, with hoods and hosen of the same colour; each of them carried a bugle-horn attached to a baldrick of silk, which he sounded as he passed the barrier. After them came Peter Lanaret, the baron's chief falconer, who personified *Robin Hood;* he was attired in a bright grass-green tunic, fringed with gold; his hood and his hosen were particoloured, blue and white; he had a large garland of rose-buds on his head, a bow bent in his hand, a sheaf of arrows at his girdle, and a bugle-horn depending from a baldrick of light blue tarantine, embroidered with silver; he had also a sword and a dagger, the hilts of both being richly embossed with gold. Fabian, a page, as *Little John*, walked at his right hand; and Cecil Cellerman, the butler, as *Will Stukely*, at his left. These, with ten others of the jolly outlaw's attendants who followed, were habited in green garments, bearing their bows bent in their hands, and their arrows in their girdles. Then came two maidens, in orange-coloured kirtles with white courtpies, strewing flowers, followed immediately by the *Maid Marian*, elegantly habited in a watchet-coloured tunic reaching to the ground. She was supported by two bride-maidens, in sky-coloured rochets girt with crimson girdles. After them came four other females in green courtpies, and garlands of violets and cowslips. Then Sampson, the smith, as *Friar Tuck*, carrying a huge quarter-staff on his shoulder; and Morris, the mole-taker, who represented *Much*, the miller's son, having a long pole with an inflated bladder attached to one end. And after them the *May-pole*, drawn by eight fine oxen, decorated with scarfs, ribbons, and flowers of divers colours, and the tips of their horns were embellished with gold. The rear was closed by the hobby-horse and the dragon. When the May-pole was drawn into the square, the foresters sounded their horns, and the populace expressed their pleasure by shouting incessantly until it reached the place assigned for its elevation. During the time the ground was preparing for its reception, the barriers of the bottom of the enclosure were opened for the villagers to approach and adorn it with ribbons, garlands, and flowers, as their inclination prompted them. The pole being sufficiently onerated with finery, the square was cleared from such as had no part to perform in the pageant, and then it was elevated amidst the reiterated acclamations of the spectators. The *woodmen* and the *milk-maidens* danced around it according to the rustic fashion; the measure was played by Peretto Cheveritte, the baron's chief minstrel, on the *bagpipes*, accompanied with the pipe and tabor, performed by one of his associates. When the dance was finished, Gregory the jester, who undertook to play the *hobby-horse*, came forward with his appropriate equipment, and frisking up and down the square without restriction, imitated the galloping, curvetting, ambling, trotting, and other paces of a horse, to the infinite satisfaction of the lower classes of the spectators. He was followed by Peter Parker, the baron's ranger, who personated a *dragon*, hissing, yelling, and shaking his wings with wonderful ingenuity; and to complete the mirth, Morris, in the character of *Much*, having small bells attached to his knees and elbows, capered here and there between the two monsters in the form of a dance; and as often as he came near to the sides of the enclosure, he cast slyly a handful of meal into the faces of the gaping rustics, or rapped them about their heads with the bladder tied at the end of his pole. In the mean time, Sampson, representing Friar Tuck, walked with much gravity around the square, and occasionally let fall his heavy staff upon the toes of such of the crowd as he thought were approaching more forward than they ought to do; and if the sufferers cried out from the sense of pain, he addressed them in a solemn tone of voice, advising them to count their beads, say a paternoster or two, and to beware of purgatory. These vagaries were highly palatable to the populace, who announced their delight by repeated plaudits and loud bursts of laughter; for this reason they were continued for a considerable length of time; but Gregory, beginning at last to falter in his paces, ordered the dragon to fall back. The well-nurtured beast, being out of breath, readily obeyed, and their two companions followed their example, which concluded this part of the pastime. Then the *archers* set up a target at the lower part of the green, and made trial of their skill in a regular succession. Robin Hood and Will Stukely excelled their comrades, and both of them lodged an arrow in the centre circle of gold, so near to each other that the difference could not readily be decided, which occasioned them to shoot again, when Robin struck the gold a second time, and Stukely's arrow was affixed upon the edge of it. Robin was therefore adjudged the conqueror; and the prize of honour, a garland of laurel embellished with variegated ribbons, was put upon his head; and to Stukely was given a garland of ivy, because he was the second best performer in that contest. The pageant was finished with the archery, and the procession began to move away to make room for the villagers, who afterwards assembled in the square, and amused themselves by dancing round the May-pole in promiscuous companies, according to the ancient custom."

AN ELEGANTLY USELESS YOUNG LADY.

Of this class of young ladies we find the following specimen in a work now publishing, called "Family Secrets":—"Isabel advanced along the path of life with feeble and uncertain steps; for in addition to her constitutional delicacy, she had to contend with a will undisciplined, and with endless longings after personal gratification unchecked, unregulated, and consequently incapable of being gratified to their full extent. Indulged as a favourite child, the greater part of her life was spent in a kind of dreamy idleness, from which she was seldom roused, except by some awakening desire for personal gratification, some complaint of mental or bodily uneasiness, or some scheme for momentary amusement, which she was generally too languid or too indolent to carry into effect. The consequence of all this was, that Isabel arrived at the age of eighteen, a victim to dyspepsia, an amateur in medicine, a martyr to nervous maladies, and as elegantly discontented with life, and all it had to offer, as any other young lady of her age could think becoming her character and station. The worst of all was, that, by this system of injudicious treatment, false tastes had been created, unnatural cravings excited for bodily as well as mental stimulants, which, under the names of cordials, tonics, and restoratives, were but too plentifully supplied. Isabel had not, like her sisters, been permitted to go to school, though hers was a case in which school discipline might have been highly efficacious; she had not even been considered capable of enduring the usual process of mental instruction at home. Thus, her education, even that inferior part which relates to the understanding and the memory, was as vague and irregular as could well be imagined. She was, however, an extensive though superficial reader; and those who conversed with her only for a short time, believed her to be a much better informed person than she really was. We have said, that, with all her disadvantages, Isabel was not absolutely disagreeable. So far from this, she generally attracted attention in company by her easy and lady-like manners, and by a countenance which, perhaps, was less beautiful than interesting and expressive. Unassailed by any of those severe trials which put to the test the real principles upon which we act, she had not made the discovery herself, nor had any of her friends made it for her, that she was in reality selfish and unamiable; for while every one ministered to her gratification, she had only to express her gratitude, affect a little willingness to deny herself, and expatiate on her regret at being the cause of so much trouble, and all went on exactly as she wished—the trouble was incurred, the attempted self-denial was frustrated, and the kindness for which she expressed her gratitude was repeated and increased. What a lesson do we learn by a sudden reverse of this order of things!—a lesson, perhaps, the most severe that experience ever teaches; while, at the same time, our dependence upon animal and selfish gratification, our irritability, impatience, and wounded feeling, when these are denied, show us but too faithfully the living picture of those passions of which we believed ourselves incapable, simply because indulgence had hitherto lulled them to rest." This listless and spoiled child, the story goes on to say, is married, but having no mental resources to fall back upon, and no taste for the active duties of life, she seeks *artificial excitement;* the result is such as might have been expected—she loses caste, and sinks into disgraced obscurity.

INSANITY CURED BY THE PATIENT HIMSELF.

I recollect a case which occurred to me thirty-five years ago, of a seaman, who had been living in a very intemperate way for some time, until he became so maniacal, that he could not be kept on board his ship. He was sent to the workhouse at Hull, where he had only been a few days, when he leaped out of the window, in consequence, as he afterwards related to me, of believing that the devil wanted to get possession of him. He thought he should escape him, if he could but get out of the house. He said he felt quite free for some time; but he at last heard him beneath the pavement, wherever he went in the town. He then thought, that if he could only leap on board a ship, which was at some little distance from the wharf, he should avoid him; but he had not been long on board, before he felt convinced that he was scratching at the bottom of the vessel, and it then occurred to him, that if he got on shore and cut his throat, he should be safe. He borrowed a knife from a sailor whom he met, and instantly cut his throat from ear to ear. As is very usual in these attempts at self-destruction, the pharynx was wounded, but the carotids were uninjured; the hemorrhage from the superficial vessels was enormous. The parts were speedily brought together; the wound healed by the first intention; he was never insane one moment after the brain was relieved by the immediate loss of blood. He related to me all the above circumstances. He got perfectly well, and went to sea within a month after his unsuccessful attempt at self-destruction.—*Sir W. C. Ellis on Insanity.*

STATISTICS OF MUSCULAR POWER.

Man has the power of imitating every motion but that of flight. To effect these, he has, in maturity and health, sixty bones in his head, sixty in his thighs and legs, sixty-two in his arms and hands, sixty-seven in his trunk. He has also 434 muscles. His heart makes sixty-four pulsations in a minute; and, therefore, 3,840 in an hour—92,160 in a day. There are also three complete circulations of his blood in the short space of an hour. In respect to the comparative speed of animated beings and of impelled bodies, it may be remarked, that size and construction seem to have little influence; nor has comparative strength, although one body giving any quantity of motion to another is said to lose so much of its own. The sloth is by no means a small animal, and yet it can travel only fifty paces in a day; a worm crawls only five inches in fifty seconds; but a ladybird can fly 20 million times its own length in less than an hour. An elk can run a mile and a half in seven minutes; an antelope a mile in a minute; the wild mule of Tartary has a speed even greater than that; an eagle can fly eighteen leagues in an hour; and a Canary falcon can even reach 250 leagues in the short space of sixteen hours.—*Bucke.*

ADHERENCE TO OLD CUSTOMS.

The Welsh plough is one of the most awkward unmeaning tools to be found in any civilised country; but the Rotherham and other improved ploughs are coming into general use. A gentleman, a naval officer in Cardiganshire, introduced the light Rotherham, and insisted on his ploughmen using them. As soon as he turned his back, the new ploughs were dismissed the service, and the old ones brought into the field. One day, in a rage, he committed the old ploughs to the flames, and set the new ones a-going. Afterwards, taking a ride to cool himself, and returning, he found the new ploughs in the ditch, and old ploughs, borrowed from the neighbours, at work; the master then thinking it useless to persevere, gave up the contest. "I have," said he, "seen various kinds of human beings, in different parts of the globe, but none so obstinately bent on old usages as the Welsh."—*London's Encyclopædia of Agriculture.*

An error occurred in the paper on Coleridge which appeared in the Journal, No. 530. The poet's children, we are informed by P. H., are the following:—David Hartley, author of an interesting book entitled "The Worthies of Lancashire and Yorkshire"—Derwent, who has written a large volume on the scriptural character of the English Church—and Sara, the writer of a beautiful tale called "Phantasmion."

THE STRUGGLES OF ADOLESCENCE.

THE passage from boyhood to youth was marked amongst the Romans by a ceremonious investiture with what they called the *toga virilis*, or robe of manhood. I presume this was put on at a certain age, so that there could be no dubiety about the matter. The boy was a boy one day; next day, he was a man; all the world acknowledged the transition, and there was no more to be said. It is very different in this country, where a lad will sometimes hang for a year or two in a doubtful state between boy and man, to the great discomfort of himself, and not without some inconvenience to his neighbours, who scarcely know how to address or consider him. He himself is probably eager to be ranked with men, and for this reason has long put away boyish things; but his seniors, somehow, are usually plaguily slow at perceiving that he has ceased to be a boy—so that, unless he puts forward some determined claim, he stands little chance of being accepted in the superior capacity. This, again, his bashfulness may forbid his doing, so that he is condemned to pine in secret under an injustice for which there is no immediate remedy.

If a youngster have elder brothers, who have for some time been received into the pale of manhood, his case is even worse. I have known desperate struggles take place between younger and elder brothers, in the assertion of a claim to be considered as an adult specimen of the genus *homo*. It is very shameful; but certainly the policy of the elder parties is decidedly of the keep-him-down character. Orlando, in *As You Like It*, is but a type of what all younger brothers have to endure from elder brothers. One may have got above any thing like a particular affection for bread and butter for several months, and by rising at five every morning, may have made way through not only Smith's Wealth of Nations, but also Gibbon's History of the Decline and Fall of the Roman Empire; yet those big fellows will still deny one's claim to manhood. One may have even begun to shave pretty regularly, though somewhat clandestinely, once a-week; yet for some time it will all not do. Constant squabbling and fighting goes on—in some instances for one or more years—before the point is finally settled.

A *toga virilis*, to be put on at a particular age, would save all these inconveniences. We have, indeed, a *toga virilis* in the long-tailed coat; but then there is no fixed time for induing it. The difficulty with the young man is—to get his long-tailed coat. That would settle the matter at once; but then nobody will let him have it. Father, elder brothers, all who have any concern in the business, are found to labour under a remarkable prejudice about long-tailed coats, albeit wearing such garments most complacently themselves. The candidate is sure to be by far too young for it: in a year or two it may do very well, but it is absurd to speak of such a thing just now. In short, he must wait. And thus they would

> "Bid him sigh on from day to day,
> And wish and wish the soul away"—

until he almost rises in rebellion against authority of every kind; when at length, like many more important things, that is conceded to terror which has been denied to justice. Well may we say to the youth, "The long-tailed coat would make you a man at once; but first catch your long-tailed coat!"

Yet, if we cannot preach in the kirk, we may sing mass in the quier. It sometimes happens that, although a long-tailed coat is for the time unattainable, a pair of boots is not so; and the exchange of shoes for boots is a step towards the desired object. A sensible youth will be content to take his reform by instalments, trusting by and by to get the whole. And it is really remarkable how far even this alteration will go in advancing the youth to his proper character. One of a set of boys accustomed to play together, appears some fine spring morning with his organs of escape encased in boots. He is instantly recognised as having undergone some strange change, though they cannot at first tell what it consists in. He is no longer the companion they had yesterday, but somehow has got quite above them. They approach with the hesitation due to his felt superiority, to see what it is that has changed him so suddenly, and ere long detect the boots; yet cannot at first understand how those articles should have such an effect. The truth is, it is not the material boots upon his feet that make him look different; there is something within that passeth show. It is the boots of his mind that make the impress. He feels booted, and no longer is the boy he was. Were his actual boots quite concealed from view, he would still be the new man—like Addison's waiting-maid, whom there was no speaking to on the day when she put on her new garters. The other fellows have a faint sense of how the case stands, and at once see that, unless they can get boots too, they must be content to strike under. Home, therefore, they go to their parents, and commence a process of agitation for boots—to every refusal replying, "Well, there's Harry Go-ahead has got boots, and he is no older than we," until they gain their point. This done, all is smooth for a time, but only till some one of the set takes another stride in advance—for instance, getting a stock in place of a black handkerchief, or a hat instead of a cap—when instantly the whole pack, as before, must struggle to get upon the same footing.

The getting of boots, stocks, hats, and such things, are but inferior stages in the career towards manhood. They are unmarked, unfelt, in comparison with the grand business of getting a long-tailed coat. There lies the real struggle of youth. The other things are outworks: the long-tailed coat is the citadel. I well remember that, when I attained to boots, my ambition had scarcely yet conceived the idea of a long-tailed coat. One is modest at first, after the manner of Colonel Jack, of whom Defoe records—"About this time the colonel thought he might take it upon him to wear a shirt." About the time when I got a hat, the vision of a long-tailed coat hung with considerable distinctness before my mental eyesight. I beheld the skirts dangling, and the yellow buttons gleaming, in one of those fits of *clair-voyance* which are only enjoyed in youth. Still the coat, like many equally important matters, long remained a matter of abstract speculation—a kind of *Yarrow Unvisited*. I was sensible of its importance, for I saw how differently a lad in a jacket and one in a long-tailed coat were esteemed; but at the same time I knew that I was yet young and small, and without any proper pretensions to be so far advanced. At length, however, the time came when the long-tailed coat could be no longer dispensed with.

I and two juvenile and jacketed friends had for years been playfellows. We not only played together on all occasions, but had a regular alliance with regard to all matters offensive and defensive. As we grew up, we came to have a joint-stock collection of rabbits, from which we expected to derive an immense fortune; but this, like so many other joint-stock concerns, turned out a complete failure. Nothing occurred to mar the friendly feeling which subsisted between us, until one of my companions, who was a little taller and spoke somewhat louder than the rest, appeared before us one morning, to our no small astonishment, in a long-tailed coat. Our tall friend had cunningly kept the matter a secret, evidently, as we thought, for the purpose of creating a sensation. I and my remaining jacketed friend were taken by surprise, and stood perfectly awe-struck and abashed, peering from under our raised hands at our exalted companion. If he had exercised authority over us while he wore a jacket like ourselves, what would he not do now that he was arrayed in all the pride and plenitude of a long-tailed coat? We trembled at the anticipation, which only turned out to be too true. He of the long-tailed coat kept us in a state of perpetual helotism. There was a swell and a swagger in his air that nothing short of a long-tailed coat could have imparted. His voice waxed louder and more imperious. He dictated and dogmatised over us at his pleasure. We of course succumbed before him, for what could jackets do against a long-tailed coat? But were we to continue in that state for ever? That was the question. We had evidently arrived at a great crisis, and something must be done. My little jacketed friend and I did not say much on the subject, but our looks spoke volumes, and we knew that we felt as one. I may also remark that our long-tailed friend did not in so many words tell us that we were wretches in jackets, but his whole demeanour announced it as plainly as if he had spoken it. He first humbled us with an attempt at affability and condescension; then cooled off entirely. He was now joined to a set of younkers who wore regular long-tailed coats and smoked cigars. We were no longer fit company for him. Flesh and blood could not stand this unmoved, and in the first heat of our indignation we cogitated how we might manage to humble him in turn by cutting a skirt away from his coat. But this passed off. We came to see that it would be better for us to try to rise to his level, than to endeavour to pull him down to ours—a plan, by the way, which may be recommended to the consideration of many older persons with curtailing doctrines. Not many weeks passed ere my sole remaining companion had succeeded in the great object. By some means, to me at the time inexplicable, he had contrived to nestle himself into a pea-green coat with marvellously long tails. I had scarcely recovered from the surprise which this gave me, when I saw him one day walking down the street arm in arm with the tall youth who had lately so shamefully entreated us both, and whom we, in our resentment, had vowed never again to speak to—no, upon no account whatever. Here was a specimen of human constancy! Matters were quickly enough decided. In less than a week, my late companion had completely deserted the party of the jackets, and was received as a full privileged member of the fraternity of the long-tailed coats.

I went home melancholy and misanthropical. Visions of a long-tailed coat, as already mentioned, had ere now visited me, but I was not eager on the subject: I could have waited meekly till time was ripe for the glory which I knew was ultimately to be mine. But when I saw myself thus cast forth as it were from my own proper society, on account of my wearing a jacket, it was no longer possible to exercise patience. It was now clear that if I did not get a long-tailed coat myself, and that speedily, I must fall back upon a set of boys below me in age and all other respects. Agitation had not then become a political principle, but was a recognised domestic one, and I lost no time in taking advantage of it. I spoke to my sister to speak to my mother to speak to my father to get me a long-tailed coat. Next evening, as the worthy man was reposing in his easy chair after

dinner, quietly and unsuspectingly taking his usual tumbler of toddy, the trenches were opened by the deputed hand of my maternal parent, who, in the blandest tones, intimated that his son and heir had taken it into his head that he would like very much to have a long-tailed coat. The old gentleman flew into a violent passion, as old gentlemen are apt to do when their pockets are attacked. "A long-tailed coat!" he roared out in an old commodore sort of way; "what does he want with a long-tailed coat? Nonsense, nonsense! If he gets a long-tailed coat ten years hence, it will be soon enough." I heard the words from behind the door, and my heart died within me. Not get a long-tailed coat for ten years! Was I to be doomed to wear a jacket, and be the laughing-stock of the whole long-tailed fraternity, for such a long time? Rather, I thought, let me die at once; and I really did for a moment contemplate suicide. But my mother, with whom I was a favourite, evidently appeared to be on my side, and I then saw reason for hope, knowing that she was in general a capital agitator. That very night, to my unspeakable joy, it was announced that "the governor" had relented, and that I might go and get measure taken for a long-tailed coat!

I immediately sallied forth and sought the dwelling of the tailor, at whose door I rapped in a bold determined manner. "Is Mr Toggins at home?" said I, in an authoritative tone. "Yes, sir;" and I was shown into a room. In a short time, Toggins appeared, with his measures disposed over his arm, and these he right quickly applied to my person. I remember yet the pleasure with which I felt his fingers touch the back of my leg as he measured me for the *tails*. I told him that I wished a first-rate article, and expected that he would spare no pains. He solemnly promised to do as I wished; and added, that to give the coat every advantage, he would put on a set of buttons of a pattern newly introduced in town, and which had only that day reached him. I left him with my head in the clouds. On Saturday night the coat was brought home. I tried it on; the fit was faultless, the workmanship beautiful, the buttons splendid. Next morning, when the bells began to ring for church, I walked forth in my coat, and proceeded with as unconcerned an air as possible up the sunny side of the street, which I adopted for the double purpose of showing off, and of seeing the shadow of my skirts on the wall. As I went along, one of a group of urchins upon whom I suddenly came, cried "Haud out o' the man's road!"—an evidence that I was no longer a boy, but a full-fledged man. The sentence, pronounced as it was in the broadest Scotch of a country town, was music to my ears, and inflated me as wind does a bag. I felt tall, and strong, and dignified, and not-care-a-farthingishly, and went into church in a frame of mind any thing but that of a sober Christian. On the following morning, it became evident that my coat had made a sensation. My former companions, who had stood aloof during the jacket régime, now came up, and were as frank and social as ever. I was inclined to be cold at first, but soon relented. The only punishment I inflicted was to report what I had been told by Toggins, but did not believe, that my buttons were the favourite buttons of the Prince Regent; at which, as I expected, they all looked rather blank. To tell the plain truth, I soon saw how absurd it would be to resent their former exclusive conduct; for, before we had walked along a hundred yards together, I felt the same contempt for one or two jacketed striplings of my acquaintance whom we met, as my new companions had lately expressed for me.

Thus happily, at length, ended the struggles of adolescence in my case; but I remain deeply sensible of how much better it would be to revive the Roman fashion, than to allow a youth to fight his way, as I had done, into the *toga virilis*—freely translated, the long-tailed coat.

BIOGRAPHIC SKETCHES.

WILLIAM SMITH, THE "FATHER OF ENGLISH GEOLOGY."

[For the advance of most sciences two kinds of men are necessary—first, the active observing man who bustles about collecting facts, then the meditative reflecting man who systematises these facts and draws conclusions. Geology is eminently one of the sciences requiring two classes of cultivators. The first was more particularly necessary forty or fifty years ago, when the science only existed in its rudest elements. At that time there were two widely different men engaged in investigating the aqueous rocks—the German mine-superintendant Werner, a sublime genius, who theorised before he had largely enough observed, and William Smith, an English land-surveyor, who only could observe. To the latter, mainly, the world has been indebted for its knowledge of the order in which that class of rocks has been formed above each other—a piece of knowledge which has enlarged in the most interesting manner our conceptions of the Creator's works, and added a new and wonderful volume to the history of the world which we inhabit. Mr Smith is only the more remarkable for this service, from his being purely a practical man, one who had few opportunities for study, little intercourse with philosophers, and no theory to lead him on and reward him for his labours. We remember well his appearance at the Edinburgh meeting of the British Association: even then, when possessing name and fame, he looked only like a rather homely kind of farmer. He is recently dead; and as there is not only a scientific but a moral interest in his history, a brief view of it, furnished by one who knew him, is here submitted.]

William Smith was born, March 23, 1769, at Churchill in Oxfordshire—over, as he was fond to remark, the oolitic formation. He commenced as a geologist in his very boyhood, it being one of his earliest amusements to collect the fossil shells which abound in this class of rocks, and to observe their several characters. His patrimony being small, he engaged in the profession of a surveyor of land; and in the course of the acquisition of professional knowledge, it was his delight to store facts in reference to the strata whose surfaces he measured and apportioned as a matter of business. In 1791, Mr Smith was employed in Somersetshire; and some years later he was engaged in executing the Somerset Coal Canal. Here he frequently descended the coal-pits, and obtained much information on the coal-measures, from the colliers and his own keen personal inspection. In the course of this period, he became intimately acquainted with the minute characteristics of the stratification around Bath, which, including the coal-measures, embraced some of the most important of our English rocks and clays. He in time collected numerous organic remains, all of which he was careful to label in reference to the precise positions from which they were derived. He was now called to survey on the Coteswold Hills; and, early in 1794, to attend Parliament in connexion with the business of the Somerset Coal-Canal Company. His journey to London afforded him an opportunity, thoroughly made use of, of observing the contours of the hills and eminences in the various neighbourhoods; nor was the conformation of ranges of knolls and minor elevations lost upon our observer. A stage-coach journey was in fact to him the perusal, though necessarily a hasty perusal, of a page of nature's volume.

He was wont to relate with peculiar zest the history of a long, but to him by no means tedious, travel which he undertook with two engineers, in 1794, to the north of England, for the purpose of collecting information on canals and collieries. Seated foremost in the chaise, he explored every point of broken ground on two lines between Bath and Newcastle-on-Tyne; and, instructed by previous observations, he correctly interpreted the hieroglyphics presented by the contours of distant hills, and traced, by aid of these and the form and position of escarpments, the strata of Bath to the coast of Whitby, and the chalk of the Wiltshire downs to the wolds of Lincolnshire and Yorkshire. At this period of his life, Mr Smith was entirely unacquainted with books on physical geography or natural history; although, even if he had been learned in their lore, there was little at that time published that could have materially assisted him in his inquiries. His ignorance was proved by numerous particulars; and chiefly by his adoption of the local designations of the particular strata, and the employment of all such terms as would be given and recognised in the respective neighbourhoods of the rocks. Many of these, however inharmonious—such as combrash, forest-marble, lias—are still preserved in the alphabet of geology, while others have yielded to more correct denominations.

In 1795, when Mr Smith became a housekeeper, he began to arrange his collections of fossils from the vicinity of Bath, *in the order of the strata*; and before 1799 he had coloured geologically the large sheets of the Somersetshire survey, and a circular map of the vicinity of Bath, both remarkably accurate. By maps and sections, also, he explained to numerous scientific gentlemen, who were attracted by the novelty of his system to visit him, those views relating to the regular succession and continuity of strata, and the definite distribution of animal and vegetable remains in the earth, which are now placed in the first lessons of geology. The great distinctive features of Mr Smith's system were now clearly presented to his own mind and to the minds of others. They were these:—That the fossil productions of the several strata are not accidentally and confusedly distributed in them, but that each species has its own peculiar place, as belonging to some particular stratum; that this species may be either confined to that stratum solely, or to that and other particular strata in conjunction; that in the first case it becomes an infallible test of the identity of two strata occurring in two different localities, and in the last case a collateral proof of that identity. Mr Smith arranged (for convenience of removal) the fossils in trays, letting down one above the other, in boxes of moderate dimensions; each box commonly containing a collection of fossils from the same rock or stratum in various parts of England. As they were nearly all collected by his own hands, he could point with certainty to the proofs of his theory of identification of strata by organic remains; and the theory was therefore fully established, and gradually made known and received. In all these exhibitions and explanations, we are especially called upon to admire the liberality and frankness of his communications to any respectable and intelligent inquirer. He reserved no portion of information to himself, but profusely bestowed it without considerations of selfishness, or thought of compensation of any kind. Had he been actuated by any thing apart from an indomitable love of the science, it is more than probable that his knowledge might have been turned to good account for his own exclusive benefit in his profession. On the contrary, it was perpetually evident that he mainly made his profession subservient to his pursuit of geology. His devotion to the science was evidenced by his receiving about this time a designation by which he was usually distinguished throughout his life from the innumerable multitude of Smiths who inhabit our island—namely, that of "Strata Smith."

Dr James Anderson and other scientific gentlemen urged Mr Smith to lay his views and discoveries before the world, and offered him such assistance as was in their power, which offers were repeated on the part of other men of eminence. In 1799, therefore, appeared a small "Tabular View of the Superposition of English Strata;" and in 1801, a prospectus for an "Accurate Delineation and Description of the Natural Order of the Various Strata of England and Wales," &c. This prospectus is in itself a brief compendium of the practical applications of geology, and displays the growing mastery of the subject, which was finally proved beyond a doubt by the appearance, in 1815, of the principal portion of his "Delineation of the Strata of England and Wales." This work was a large map, in fifteen coloured sheets, of the kind now known as geological maps, and was the unaided production of this one zealous geologist. Considered in this light, and also, indeed, of that of a near approach to general accuracy, its merits can scarcely be overrated. And although it was not long after followed by the more accurate map of Mr Greenough, it is not difficult to suppose that the formation of the latter was greatly facilitated by the labours of Mr Smith, at least in diffusing geological knowledge over a large portion of England. Nor must it be forgotten that he had long prepared the main parts of the map, but did not meet with sufficient encouragement to publish it. Sir Joseph Banks had become acquainted with our geologist in one of his visits to the agricultural meetings, called "sheep-shearings," at Woburn and Holkham, and afterwards proved a warm patron and the promoter of a subscription to assist the publications of our author.

In 1804 Mr Smith had removed to London, and in 1806 he published a treatise on irrigation. From this period up to 1815, he had attracted notice in various ways; and in that year, when his great map appeared, the British Museum purchased his whole collection of fossils for L.500. The task of arranging these led to the publication of two small quartos, entitled, "Strata Identified by Organised Fossils" (1815); and "Stratigraphical System of Organised Fossils" (1817), the latter being designed as an index to the specimens in the museum. Between the appearance of the great map in 1815 and 1821, Mr Smith published no less than twenty geological maps of English counties, often remarkable for their near approach to accuracy. It is, however, painful to record the fact, that all his efforts had been insufficient to ensure himself a moderate or even small competency. He was compelled to forego his residence in London, and in some degree to lead a wandering life in various parts of the country. In 1824, he delivered a course of lectures on his favourite science to the members of the Yorkshire Philosophical Society, and repeated these the same year, in conjunction with his nephew (the well-known Professor Phillips, the author of several works on geological subjects), at Scarborough and Hull. In 1825, similar lectures were delivered at Sheffield, and efforts were made to secure some permanent engagement for Mr Smith. He at length was offered and accepted an occupation as agent to Sir John Johnstone, Bart., at the beautiful retreat of Hackness, near Scarborough. Here, as usual, he set himself to geological research, the result of which soon appeared in a map and a collection of fossils. I shall ever remember the hearty shake of a weathered hand with which he welcomed me to Hackness, whither I had repaired to reside for some time with him as his pupil. He, on this occasion, set myself and a friend who accompanied me down to a bread and cheese luncheon; but before our hunger was half appeased, he insisted on hauling us out to inspect the outline of the neighbouring hills. My friend, who professed no passion for practical geology, could not leave the cottage without casting at least "one longing, lingering look behind."

Mr Smith subsequently spent the main portion of his time at Scarborough, the vicinity of which is rich in objects of geological interest. He had, as early as 1817, planned the arrangements of the beautiful museum at that place, and it was erected and carried out upon his plan. The building is circular, and the fossils and geological and mineralogical contents are arranged in sloping shelves, one above the other, in such a manner that the circle presents a good silent lecture on the strata. The order of natural superposition is followed, and thus the positions and productions of the several strata are at once observed.

The practical value of his knowledge has been most triumphantly proved in the instance of the Great South Hetton Colliery in Durham. For, in 1821, Mr Smith recommended to Colonel Braddyl, the proprietor of the estate, to search for coal *beneath* the

magnesian limestone. The idea of such a search was always previously held to be one of very great uncertainty in its result, and by some was entirely scouted. The issue of the experiment has proved the most fortunate possible to Colonel Braddyl and others; for excellent coal has been obtained, although not without considerable difficulties in sinking the shafts.

Our geologist was intensely gratified, and partially rewarded for comparative obscurity, in the presentation to him, in 1831, by the Geological Society of London, of the first Wollaston medal, accompanied by a merited and eloquent eulogium by Professor Sedgwick, in the course of which he styled Mr Smith the "Father of English Geology." In the same year, also, the British Association, assembled at York, made application to government for a pension to Mr Smith, which was ultimately settled upon him for life, to the amount of L.100 annually. The crowning gratification of our philosopher was bestowed at Dublin, in 1835, when the University, during the meeting of the British Association in that city, conferred upon him the degree of LL.D. On the first day of the meeting of the association I encountered him, as I was hurrying to the assembly, in the street, and, ignorant of his new honour, cordially addressed him in the usual style of Mr Smith, which designation he instantly paused to assure me was defunct, and dilated with pardonable vanity upon his doctorship. Occasionally, on passing him during the day, I overheard him explaining to other friends the error into which their ignorance, like mine, had led them; and even on the last day of the meetings of the association, the same verbal correction was in process of being administered to the last ignorant delinquent.

Several of his friends expected the pleasure of again conversing with him, in 1839, at the meeting of the British Association at Birmingham. Great, however, was our regret and surprise to hear, upon our arrival there, that Dr Smith had closed his life and labours at Northampton, September 23d, while on a visit to a friend, in his way to the meeting. It was a remarkable coincidence, that a wish of his, often half-jocularly and half-pensively expressed, had been realised in the site of the place of his death. He had often said that he wished he might close his labours on the stratum on which he had commenced them—namely, the oolite. Northampton is situated on the oolite! And in St Peter's churchyard repose, on that very stratum, the remains of "Strata Smith."

I have enumerated the titles of the principal publications of Dr Smith; but, with the exception of the great map and the other maps, they were usually but partially complete, and were obviously intended more as preludes to sustained efforts to be made, either by him or others, under more favourable circumstances. This admission does not detract from his justly earned fame, but it will account for the fact that their author has been almost forgotten, except among his immediate circle of friends. He was in the habit also, during many of his latter years, of recording his recollections and ideas based upon them, upon separate slips of paper, in a neat handwriting. These slips accumulated to a formidable extent—so formidable, indeed, as to render the chance of their arrangement and reperusal very remote. He one day opened all these stores to me, and urged upon me the desirableness of reducing them to order and methodical arrangement. I undertook the task with some perseverance and ardour; but ultimately relinquished it, from the utter impossibility of accomplishing the project satisfactorily—as, indeed, such a loose mode of composition might naturally have led me to anticipate. It must not be concealed, however, that Dr Smith's views were not exactly accordant with the advanced state of geological science in his latter years. He could by no means be brought to acquiesce in the theories propounded by some of our bold modern investigators; nor was he always sparing in his attempts to disprove or disparage them, whether justly or not it is not my purpose here to determine. But I well remember with what an indignant zest he was occasionally wont to exclaim against the fashionable tendency to refer particular distortions or depositions to particular and secondary agency; and the modern readiness to create a special cause for every special event and effect. These dissertations he used generally to conclude by saying—"Ah! sir, these modern theorists only want to make out the Creator *a journeyman!*" Such pithy apothegms were frequently, for example, introduced in his discussions with me upon the vegetable origin of coal—a theory in which he was by no means disposed to acquiesce.

His brother geologists always very properly paid a due degree of respect to the venerable founder of their improved and certain system of observation; and hence seldom controverted his opinions so ardently as they might otherwise have been disposed to do. Hence, too, it was by common and ready consent that an honourable seat, amongst the chief men of the section, was always assigned to "Father Smith" at the meetings of the British Association. These meetings were, indeed, his glory and comfort in his declining days, and were looked forward to by him with a degree of intense interest that ordinary people could not understand or appreciate. I was present with him at every meeting of the association except the two first; and was always much delighted with the paternal interest with which he appeared to regard the proceedings of his sons, if so they might be called—which is the more questionable, perhaps, as he considered some of them very far from dutiful in their unruly attempts at theorising. While we were one morning breakfasting with Professor Sedgwick, at the Cambridge meeting of the association, a very good-humoured paternal correction was gently administered to the accomplished professor, and most dutifully received by him, although it does not appear by his subsequent course that it was productive of serious effects upon him.

Latterly, Dr Smith was afflicted with deafness to some extent; but this did not prevent his attendance at the several meetings of the association, and his occupation of a doctor's chair in all seeming state. Occasionally the lecturer for the day would turn aside towards him, and utter in a louder key some complimentary allusion to the "father of English geology;" whereupon it was most delightful and amusing to witness the conscious merit of the venerable philosopher, and the warm respect of the *illuminati* around him. These allusions, deaf as he was, he never failed to hear and treasure up, to be retailed on all fitting occasions to those who had not the privilege of hearing them at their birth. But especially after his reception of the Wollaston medal, I imagine, no stranger was introduced to Dr Smith without at the same time being introduced by him to the medal. The old man carried it about with him in its red leather case wherever he went, and was ever able to lay his hand upon it at a moment's warning. Before the form of the introduction of any stranger was well nigh completed in all its ceremonies, the doctor's hand was in his pocket, and in an instant he would commence, in a kind of low utterance, "This is my medal," &c. Some of us were scarcely able to restrain a smile upon such occasions. Nor, if any stranger was present at breakfast with him, were we unacquainted with what would prove the theme of conversation; and usually we so far gratified him as to prevail upon the servant to arrange things in a convenient manner; for, upon the first break of the uniformity of the plate of bread and butter, the doctor would turn with a complacent semi-smile to the stranger, and say—"Now, that plate of bread and butter occurs to me as a capital exemplification of the order of the strata. You see, they crop out and overlie each other, just as the pieces of bread do. There, you see, you may form a good notion of the oolite beds by that arrangement. Suppose we double these pieces, thus, we represent a distortion," &c.

It will readily be conceived from these remarks that Dr Smith was an acute observer of common, and hitherto usually neglected, facts. To the last walk of his life, he geologised as he walked; and from the first days of his life he thereby acquired an invincible habit of looking on the ground if walking, and on the fields if riding. A spring in a field, a stone, a building, a quarry, a clay-pit, brick-field, lime-kiln, and even a ploughed field, were all made to minister to his favourite science, and all to minister well, though not always with novelty. By this perpetual observance of the qualities and properties of external objects, continued throughout an active life, he became not only an interesting companion to the unoccupied stroller, but a profitable fellow-traveller to the practical man. Hence he was appointed to accompany Mr Barry and other commissioners upon their investigations into the durability and suitableness of the stone for the new Houses of Parliament; and he frequently astonished these gentlemen by the accuracy of his local knowledge, and the verity of his predictions as to the course and quality of certain rocks. No opportunity of studying the properties of stone was neglected by him, and no time was deemed unsuitable by him for such inquiries. If attending a parish church to which he was a stranger, he was sure to spend some time before or after service in the churchyard, observing how far the stones had become worn by the weather in proportion to their age. I have more than once walked with him through such a scene, while he pointed out the stratum and locality from which every tombstone was derived.

My friend (above alluded to) who accompanied me to Hackness, was a zealous and most pious clergyman, and, as was his wont, immediately commenced a professional crusade against the man of science, in which, after numerous assaults, he had to confess himself foiled—not by the opposition of the philosopher, but by his perfectly quiet acquiescence in all he propounded, and his reception of the applied force without a particle of reaction, save that every remark of the professional man was dexterously directed by the philosopher to the advancement of geology. My pious friend raised the siege upon being most thoroughly deceived by the meditative appearance of Dr Smith on one occasion in Scarborough churchyard. The doctor was poring pensively over the tombstones, and thereby deluded my friend into the belief that his opportunity for instilling his advice was indubitably arrived—a conclusion which he discovered to be hopelessly fallacious, when the real nature of the doctor's cogitations was made known.

Dr Smith's moral conduct and character were most exemplary throughout his whole life; and his unfailing kindness in circumstances of the most trying domestic affliction, were no less conspicuous and praiseworthy than his unshaken fortitude in bearing up against pecuniary difficulties. It was remarkable that his cheerfulness and hilarity continued almost to the last day of his life. He died indeed of natural decay, at the age of seventy-one, and without pain; his temperate and active habits, together with the healthy character of his pursuits, having kept him hale to the last.

THE YOUNG PRISONER OF THE CONCIERGERIE.

At the period of the French Revolution, there resided in Paris a family called Gerfeuil, consisting of a father, mother, and one son, Edward Gerfeuil, who was about fifteen years of age, a pretty, clever, interesting boy, the darling of his parents' heart and the pride of their eyes. But at the same time that he was a source of unbounded comfort to them, he was also a subject of the deepest anxiety; for at that season of anarchy and peril, when no one's life or fortune was secure, they trembled at the thoughts of the future that might await their innocent child. They possessed a comfortable independent fortune, the whole of which was designed for Edward; but who should promise that he would ever inherit it? The slightest imprudence on the part of the father or mother might render them objects of suspicion; indeed, they might become objects of suspicion without any imprudence at all—they might be accused by an enemy, they might be compromised by a friend, they might be dragged to the scaffold any day without a moment's warning, or they might be obliged to fly their country with nothing but the clothes they had on their backs. And what was to become of their Edward, bred in affluence, nurtured in delicacy, educated in refinement? Many and many an anxious hour did these reflections cost Monsieur and Madame Gerfeuil.

"I sometimes think," said Monsieur Gerfeuil one day to his wife, "that it would not be a bad plan to make Edward learn a trade. In these times, when every body's fortune is so precarious, and when, without any fault of our own, we may be in affluence to-day and beggars to-morrow, it would be advisable to have something to fall back upon—some resource by which one might earn one's bread, in case of the worst falling out."

"What could he learn?" said Madame Gerfeuil.

"We must consult him about it," answered the father. "For my own part, I should recommend printing, because the education he has received would there turn to some account, and he would find some occupation for his mind as well as his fingers."

When Edward was consulted, he agreed that he should prefer printing to any other occupation; and as he promised himself a great deal of diversion from appearing in a part so new to him, he made no objection to the proposal. A working dress being therefore prepared for him, and a respectable establishment selected by his father, the youth commenced his apprenticeship; attending at the printing-office a certain number of hours every day, and receiving instruction in the various branches of his art.

The plan seemed to answer very well. Edward Gerfeuil was fast acquiring dexterity; and the father and mother were comforted to think that they had provided such a resource for their son in case of extremity, when a dreadful calamity befell them. A pamphlet supporting principles very obnoxious to the revolutionary tribunal, which had been circulating amongst the people, was traced to the printing-house of Monsieur Gros, and suddenly himself and all his workmen were arrested and carried off to the Conciergerie, and amongst them poor Edward Gerfeuil, who, although he had never seen the pamphlet, nor was aware of its existence, being at work in his printer's dress, shared the fate of his companions.

Who shall paint the alarm and distress of the parents on learning this intelligence; for, alas! how few were there who, once arrested on suspicion, ever escaped with their lives! What availed his youth?—what availed his innocence? How many, as young and as innocent, perished weekly on the scaffold! And then, how bitterly they reproached themselves. Their over anxiety had been his destruction; and what to do to assist him they did not know. Even to prove his innocence, if innocence would have availed, was next to impossible; they had no acquaintance with any body in power; in all probability their motive for sending him to the printing-office would not be credited, if they told it; and they almost dreaded to raise a stir about him, lest by drawing attention to his case, and betraying that he was what would be called *an aristocrat*, they should only accelerate his fate.

In the mean time, poor Edward, after undergoing the form of an examination, in which he was only insulted when he attempted to explain who he was, and account for being found in such a situation, was dragged to the Conciergerie, and flung into a dungeon—a dungeon under ground, too, for a French prison under the old *régime* was a dreadful place; they have since been much improved, as is always the case as countries become more civilised and enlightened. People then learn to know that the loss of liberty and the inevitable hardships of a jail, are punishments enough for slight offences, and all that we are entitled to inflict on unconvicted prisoners. But no such rays of mercy had yet reached the hearts or understandings of Edward's jailers, and he could not have been worse treated if he had robbed a church or committed murder. The poor boy's feelings may be imagined—torn from his comfortable home and his tender parents, and transferred to the custody of a harsh turnkey, in a miserable cell, without light, without fire, with a

wretched pallet to lie on, and dieted on bread and water. And to all these sufferings was added terror —the terror of what remained behind. Though Edward had never seen the guillotine, he had heard too much of it; and although, with the natural thoughtlessness of youth, he had reflected little on the peril in which all men lived, as long as that peril did not approach himself or his parents, yet he had missed too many of his friends and neighbours from their accustomed paths and daily whereabouts, not to comprehend something of his own situation. Poor child! how did the darkness and the silence, too, frighten him! How eagerly he watched for the jailer's visits! how welcome was the gleam of his dull lantern! how he drank in the tones of his husky voice! and how he listened to the echo of his receding footsteps, and sighed when he heard them no more! Then he wondered so much if his father and mother knew where he was, and he trembled with the dreadful apprehension that they might not be able to trace him, and that he might some day be carried to execution without ever seeing or hearing from them again. What, too, if they had been arrested as well as himself? Then there would be none to interest themselves for him, and he might perish either in the prison or on the scaffold, without an arm being stretched out to save him.

It may well be conceived that all these horrors—the anxiety of mind, the bad living, the confinement, and the unwholesome air of his dungeon—were not long in showing their effects on a boy of fifteen. Poor Edward fell ill; the medical man that attended the jail had him removed to a cell a degree less wretched than the one he was in, and having with some difficulty saved his life, he ordered that he should take an hour's exercise every day in the court—a miserable place, surrounded by four high walls, little better than a dungeon open at top. However, such as it was, it was a great comfort to poor Edward, for here he at least caught a glimpse of the sky, and saw the faces of other human beings, although he was not allowed to address them; and many a kind glance cast upon the poor young captive, made him feel that there were yet tender hearts in the world, who could pity though they could not aid him

It happened that the jailer had a daughter, a girl about a year older than Edward, whose home was with her father at the prison, whither she returned each night, whilst her days were spent in acquiring the art of dressmaking at a fashionable establishment in the Palais Royal. She thus very rarely saw any of the prisoners; but one Sunday, as her father was conducting Edward to take his daily walk in the court, she chanced to meet him, and, struck with his appearance of youth and suffering, she inquired the cause of his being there.

"It's very hard," said the jailer's wife, when she heard the account given by her husband, and who, being a mother, was disposed to feel for one so young. "I dare say he only printed what his master told him, without troubling himself to know the meaning of it. What should a child like that care about politics?"

"It's no business of ours, wife," replied the man, who, though by no means particularly hard-hearted, was afraid to cultivate feelings of compassion, lest they should bring him into trouble. "We have nothing to do but to look after our prisoners, without inquiring into the right and wrong of their cases."

"That's true, indeed," said the wife; "walls have ears, and the least said is soonest mended." The impression made upon Annette's mind, however, was not so easily effaced; and the emaciated form and pallid cheeks of the young prisoner were often remembered when she was plying the needle at her daily toil.

It may be imagined, at a period when so many innocent and virtuous persons were thrown into prisons, and daily perishing upon the scaffold, that it was no uncommon sight to see their anxious friends hovering about the gate, and gazing at the walls which contained objects so dear, whom it was too probable they might never behold again. Annette's eyes were therefore too much accustomed to these melancholy visions to be generally much struck by them; but her attention had been drawn to the constant attendance and careworn countenance of a lady, who, she fancied, not only looked at her as if she had a great desire to address her, but whom she had observed, more than once, to follow her all the way to her magazine in the Palais Royal. She had also remarked this lady occasionally buying things in the shop; but as Annette worked in a back room, and only perceived this circumstance through a glass door, there was no opportunity of communication. At length, however, the lady ordered a dress to be made for her; but when the mistress of the establishment proposed to wait upon her to try it on, she offered to save her the trouble, by stepping into her back shop and having it done at once. There were several young people at work in the room, but Annette could not but observe that the stranger's eyes sought none but her. When she went away, she gave her name as *Madame Rosbeck*, and said she lived near the Pont Neuf; "and," continued she, glancing still at the jailer's daughter, "if any of your young people come from that quarter, I should be glad if she would call at my house tomorrow morning, on her way here, as I have some lace by me which I will send you to put upon my dress."

"That will be in your road, Ma'amselle Annette," said the mistress of the shop; "don't forget to call as you come past."

"No, ma'am," replied Annette, involuntarily looking at the lady as she spoke, for she could not help fancying there was some mystery behind this matter of the lace. The lady, too, looked at her, and said, "Pray, do not forget," and then she took her leave.

"Father," said Annette that night at supper, "have you any prisoner here of the name of Rosbeck?"

"No," answered the jailor. "Why do you ask?"

"Oh, nothing particular," said the daughter; "only they were talking at the shop of somebody of that name being arrested."

"They have not been brought here, then," answered the man; "indeed, we're quite full; but I suppose the guillotine will take some of them out of our way tomorrow."

"Not that poor young boy, I hope," said Annette.

"Why, no," answered the father. "I don't think it will be his turn just yet. There are others will go before him."

On the following morning Annette, not without considerable curiosity, presented herself at the address given by Madame Rosbeck; and, on naming her errand, she was introduced into that lady's bedchamber.

"Pray, sit down," said Madame Rosbeck. "I have desired my maid to bring the lace. In the mean time, let me give you a cup of chocolate. I am just going to take my breakfast."

Annette would have been more surprised at an attention so unusual, had not her previous observations satisfied her that she was wanted to give some information, or to perform some service, of more importance than fetching the lace; so she accepted the invitation, and seated herself, saying, at the same time, that she could not wait long, as her presence would be required at the magazine.

"Since that is the case," said Madame Rosbeck, "I had better proceed at once to what I have to say to you. I am aware that you are the daughter of the jailer at the Conciergerie, and I daresay you have observed me in that quarter before this."

"Yes, ma'am," said Annette, "I have; and I fancied that perhaps you had some relation or friend there you were anxious about."

"That is the truth," said Madame Rosbeck; "there is a person there I would give the world to learn some tidings of. Do you think you could procure me any?—and would you, if you could?"

"I would very willingly, ma'am," said Annette; "but I know very little about the prisoners, and very rarely see any of them. But perhaps I might find out something from my father, though he is not fond of talking about them either. Is it a lady or a gentleman?"

"Oh, it's a child—a mere child!" exclaimed Madame Rosbeck, clasping her hands in agony; "it's my son—my only son!"

"I saw one poor boy there, who is allowed to walk in the court because he is ill," replied Annette; "but my father said his name was Gerfeuil."

"Oh, that is he!" cried the mother—"that is my poor Edward! I am Madame Gerfeuil; but I have taken this lodging in the name of Rosbeck, in order to be near my son, and that I may watch the tumbrils as they pass with the prisoners for execution, that I may be sure he is not amongst them. Then you have seen my poor child, and he is ill?"

"He has been very ill," said Annette; "but he is now better."

"Oh, if I could but see him!" exclaimed Madame Gerfeuil."

"I fear that is impossible," replied Annette. "Since one or two of the prisoners escaped through the assistance of their friends, no visiters are admitted."

"Could you give him a letter or a message from me?" asked Madame Gerfeuil.

"I don't think I could," answered Annette; "for the only chance I ever have of seeing him is as he is going to and from the court; but then my father is always close beside him."

"And is your father so very strict?"

"Very," said Annette; "he is obliged to be so. But if you will give me the letter, I'll keep it always in my bosom, and if any opportunity of giving it to him should offer, I'll do it."

It was arranged that Annette should call for the letter at night; and after some more conversation, she took her leave, and pursued her way to the Palais Royal. Although a jailer's daughter, she was a girl of tender heart and kind feelings, and all day as she sat at her work her thoughts were upon the poor mother and son; and her young companions laughed at her silence and abstraction, and accused her of thinking of her lover, whilst she was taxing her ingenuity to find some contrivance for delivering the letter. But none could she hit upon. The only chance she ever had of meeting Edward was on a Sunday; but she had no excuse for going into the part of the building occupied by the prisoners, and had she not been sent with a message to her father, she would never have seen him at all; and even if she did contrive to throw herself in the way, the jailer was so watchful, that she feared it would be impossible to accomplish her object. And, accordingly, at the end of four weeks the letter was still in Annette's bosom, and poor Madame Gerfeuil as miserable and anxious as ever, except that the daily visits of the young girl afforded her some little consolation. It was a slight comfort to her to speak to a person who dwelt under the same roof with her Edward, and to think that she had made a friend for him, powerless as that friend seemed to be.

Suddenly, however, about this time, a fresh access of fury and rage for executions seemed to seize on the minds of the blood-thirsty revolutionary tribunal; and Madame Gerfeuil was plunged into daily agonies of terror at hearing of the fearful rapidity with which their victims were hurried to the scaffold; and from the hints dropped by her father, even Annette began to tremble for her young protégé.

Madame Gerfeuil had a waiting-maid, a young person without father or mother, whom she had taken into her house when a child, and brought up. This girl, who was now about sixteen, was extremely attached to her mistress, and sympathised warmly with all the mother's anxiety for her son. "If I could but be the means of procuring his release," she often said to herself, "it would be some return for all I owe to Madame Gerfeuil. In the vague hope that some opportunity of being of service might offer, she neglected no means of cultivating the good-will of the jailer's daughter, who at length invited her, one Sunday, to supper; from which time she became a visiter in the family—a privilege she took care to make the most of, frequently contriving to meet her friend as she returned from the Palais Royal, where, having accompanied her as far as the gate of the Conciergerie, the jailer, on opening the door, would invite her in to see his wife; and thus, little by little, Madeleine had got on a footing of intimacy, and was a pretty constant visiter in Maitre Jacques's parlour. Having accomplished thus much, she next began to hint to Annette how possible it would be to possess themselves some evening of the jailer's keys, at an hour that he was not likely to miss them, and make their way to Edward's dungeon. "If he were only to see me for a moment, it would be such a comfort to him," said Madeleine; "and it might perhaps save the life of his poor mother, whose heart is breaking, and who, I am sure, will not live long if we cannot afford some relief to her anxiety."

Annette was not unwilling to do any thing she could for Madame Gerfeuil; but she saw many difficulties in the way, and, above all, she dreaded her father's anger if their attempt were discovered. However, Madeleine contrived to overcome her objections, and the ensuing Sunday night was fixed upon for the enterprise.

The young girls spent a good part of the day together, first attending mass, and then walking with their friends, till, at the approach of evening, they directed their steps towards the prison, each armed with a bottle of wine, which Madeleine had bought at a guingette, and which they carried under their shawls, wherewith to treat the jailer. "Whilst he is drinking, he will not be so likely to observe what we are doing," said Madeleine; and when she told Maitre Jacques that she had brought him a couple of bottles of good wine to make merry with at supper, he expressed himself extremely obliged for her kindness. "But," said she, "you must do me a favour in return; you must let Annette go home and sleep with me tonight; to-morrow, you know, is a fête, and as she has a holiday, we have made a party to go to St Cloud; and we are to start very early that we may have a long day of it." To this proposal, fortunately, no objection was made; and, to cut short the narrative of the insidious proceedings of the two girls, the jailer's senses were lulled, the keys were taken possession of for only a few minutes, and the active pair reached the cell of the unfortunate Gerfeuil. In a moment he was in the arms of his faithful Madeleine, and inquiring for his dear mother. "She is quite well, and living in the next street, in order to be near you," answered the girl; and in a few hurried words she gave him the information which he was most urgent to have. "But there was one thing," continued she, "that your mamma particularly desired me to caution you about, in case you are brought up again for examination;" and as she spoke, she drew him gradually towards the door, whispering as if making some private communication, whilst Annette, whose limbs had almost failed her through fear, seated herself on the side of the bed.

The door was ajar, the key on the outside—"Now run!" said Madeleine, thrusting him out; and in a moment more they were both hurrying along the passages by the light of the lantern which she had taken care to carry herself. When they reached a convenient spot, she paused, and taking off a loose upper dress, and a shawl, with which she had provided herself, she disguised Edward in this female attire, and completed it by placing on his head a drawn muslin bonnet, which being pliable, she had also contrived to conceal about her person. She had too carefully marked the road as she came along to miss it now; and presently they found themselves at the door of the jailer's parlour. "Now," said she to Edward, placing him in a dark corner, "stand there, and when I come out take hold of my arm; but don't speak for your life;" and she entered the room. "Maitre Jacques," said she, shaking the jailer by the arm, for he was still asleep, "how can you keep us waiting so? Here are Annette and I wanting to get out; and I shall get into trouble if I stay here so late. Pray, do come and open the gate for us."

"Eh!" said Maitre Jacques, rubbing his eyes and

shaking himself awake, "what do you want? Where are you going?"

"Home to bed, to be sure," replied she. "You know you gave Annette leave to go home with me to-night. Come, do open the gate, will you? We can't wait any longer."

"Annette! Where is Annette?" said Maitre Jacques.

"Here, at the door, waiting for you. Come, do make haste;" and she half dragged the drowsy jailer from his seat, and led him towards the door. "Come, Annette," said she, taking Edward under her other arm; "your father will let us out now;" and they proceeded towards the gate—the key was at the jailer's belt—he opened it, and in an instant more they were in the street, and the fearful gate locked behind them. Through cross streets, and at first with a deliberate pace, lest whilst near the prison they might excite suspicion, they traversed a considerable part of the city, till at length Madeleine stopped at the door of a house unknown to Edward. "This is not papa's," said he. "No," said she; "it would not be safe to take you home; you must be concealed here for the present." In that house dwelt an old servant of Monsieur Gerfeuil, to whom the family allowed a pension, and on him Madeleine knew she might rely with confidence. Her reliance was not disappointed. Edward was gladly received; and, continuing to wear the dress of a female, he remained there several weeks, and Madeleine with him; till, favoured by the disguise, it was thought possible to remove them both from Paris; and not till then, so fearful were they of betraying the place of his concealment, did the anxious father and mother permit themselves the happiness of beholding their rescued child. It is gratifying to be able to add, that, except her father's displeasure and her own terror, poor Annette suffered no ill consequences from the adventure. When Edward's name appeared in the list of those to be sent to the scaffold, Maitre Jacques contrived to persuade the authorities that he had been executed some time before; and as he was not a person of sufficient consequence to excite much inquiry, and as they had plenty of heads to cut off without his, after a little blustering and pretence at investigation, the affair was suffered to die away, and was forgotten.

Edward and his parents escaped to England, where he found the means of putting the knowledge he had acquired in his profession to some use—indeed, the greatest which can be supposed, the support of himself, and an aid to that of his parents. Thus, for several years, did the family remain in London till the Reign of Terror was over, and refugee emigrants found it safe to return to their native country. One of the first acts of the Gerfeuils, on being restored to their property, was to seek out Madeleine, to whose fidelity they owed so much, and to place her beyond the reach of want for the remainder of her existence.

LETTERS FROM A LADY IN LONDON TO HER NIECE IN THE COUNTRY.

VISIT TO THE BRITISH MUSEUM.

My dear Jane,—I never stir abroad in this wonder-exciting place without feeling a kind of desire for the possession of a more acute degree of perception than seems to be requisite at other times, or under other circumstances—a wish for more than the ordinary complement of eyes and ears, so as to be enabled to catch as much as possible of what is continually passing around; but were one's head placed on a pivot, and studded round and round with eyes, each organ of vision being multiplied in its power an hundred-fold, yet would there still be a disproportion between the objects to be seen and the power of observing.

This was experienced in all its force while visiting the British Museum the other day; and although the objects there are *stationary*, affording a hope that if you cannot undertake their inspection all in one day, you can return again as often as you please, yet there is on all sides so much to interest, that the eye, instead of becoming fatigued, gets engrossed by the curious and wonderful variety of things presented to its notice, and looks greedily around, as if desiring to comprehend all at once.

I regret having deferred my visit to this extraordinary place until my time was so far spent, that a survey, which might be profitably extended over a period of weeks, was necessarily condensed into a few hours; yet in this comparatively short time I was enabled to form a pretty comprehensive idea of the institution generally, and had the gratification of seeing some things of peculiar interest, not usually exhibited, of which I shall here endeavour to give you some account.

The British Museum is the property of the nation, large sums having been expended from time to time by government in the purchase of extensive and valuable collections amassed by various private individuals, whose pursuits and tastes led them to take an interest in whatever was curious in nature or valuable as works of art. To these have been added vast collections of books of the most costly and rare description, amounting to many hundred thousands of volumes, besides manuscripts, some of them of great antiquity; drawings, engravings, and prints, all of which have either been secured by expensive purchase, or have been presented as gifts by various distinguished individuals. The building now appropriated to the purposes of the museum was formerly a nobleman's private mansion, purchased about the middle of last century by the trustees of the museum. This building has been extended from time to time, so as to accommodate the constantly accumulating stores by which the museum has become enriched: room after room and gallery after gallery have been added, and still the accommodation is inadequate to the constantly increasing demand. The house itself is situated in Great Russell Street, Bloomsbury, and is hid from observation by a brick wall of considerable height. A large gate, closed and guarded by two soldiers, admits the visiter to a square court. The main building is on the side facing the entrance-gate, and is flanked by wings on each side, those forming the sides of the court, which is thus occupied on three sides by buildings. These wings serve as the residence of the principal persons connected with the establishment; that on the left hand, on entering, being the dwelling-house of Sir Henry Ellis, who is chief superintendant. Monday, Wednesday, and Friday, are the three days of the week on which the museum is open to the public gratuitously; but on these days the visiters are in general so numerous, amounting sometimes to eight or nine thousand daily, that a distinct or leisurely view of the various objects is difficult of attainment. I therefore gladly availed myself of the polite offer of Mr Jossi, a gentleman connected with the museum, who courteously tendered his services as a guide through the different departments, on a private day, by which means we were enabled to roam at will through the seemingly endless galleries and saloons. For this obligation I can scarcely express my gratitude in terms sufficiently warm, as I was not more impressed by the sacrifice of time which it involved, than by the benefit derived from the intelligent remarks of my conductor.

On passing through the courtyard, we entered, by a door in the centre building, a large hall adorned with statues—one, of the late Sir Joseph Banks. A broad staircase, leading from the left side, conducts to the upper floor. This staircase and the roof of the hall are painted, the subjects representing scenes from the heathen mythology, executed by a French artist, Charles de la Fosse. From the top of the stairs we were conducted through several apartments, the walls of which were surrounded by glass cases containing various objects of curiosity, such as Esquimaux dresses, weapons, &c.; but as there was something more attractive in the apartments beyond, we made our way to the first saloon, a long and spacious room, lighted from the roof. The Print-Room, which leads off from one end of this saloon, contains engravings and prints amounting in value to upwards of one hundred thousand pounds, which are intrusted to the care of Mr Jossi. The saloon is furnished with cases with glass fronts, all along the sides of the wall, the shelves of which are filled with the natural history department—four-footed animals of all nations, some of them exceedingly curious.

The room succeeding this is of similar construction, and contains specimens of birds, properly classified; and here we are instructed in the equality which nature observes in distributing her gifts, by finding that those little feathered creatures, whose beautiful exterior we should most admire, are dumb as regards song. Some of the foreign birds are wonderfully beautiful, their plumage exhibiting the utmost variety of hue, blended together with the most exquisite harmony as regards arrangement of colour. But it is vain to linger here, however great the attraction. These rooms are traversed by long mahogany tables, covered with glass cases, in which are arranged shells, corals, and other treasures of the deep; the shells of all sizes, from the largest down to those which are so small as to be scarcely perceptible—and yet, on inspection, they are, in their minute formation, as complete, and as well adapted to the accommodation of their little tenants, as those of the largest proportions. The walls above the cases are graced by portraits, the greater number of them of persons who have been contributors to the museum.

The Mineral Room next claimed our attention: a large apartment, the first of a series running in another direction from those we had just issued from, and occupied by long tables with glass cases, enclosing the various articles of mineral production. Specimens are here exhibited of gold and silver, of diamonds, and other stones which we are in the habit of looking upon as precious, all in their rough state as taken from their native earth. Our attention was particularly directed to some fragments of remarkably large meteoric stones which have fallen from time to time in various parts of the world. These stones have more the appearance of metal than stone, being largely impregnated with iron, nickel, &c. The largest fragment is part of a large mass which fell at a place in Alsace (Upper Rhine), in the latter part of the year 1492. This stone weighed 270 pounds, and was preserved till the period of the French Revolution in the Cathedral of Ensishiem, when, for better security, it was deposited in the public library of Colmar. Another specimen, being part of a stone of 56 pounds, which fell in Yorkshire in 1795, is also shown, along with many others. It will perhaps be in a great measure new to you, that showers of stones fall from the air with what may be called frequency, when the whole surface of the globe is considered.

An adjoining room is devoted chiefly to fossil zoology, that is, to the reception of those remains of animals which are found petrified in rocks, and of which so many are strikingly different from any animals which now exist. Although I was familiar with many of these extinct forms of being, from seeing them delineated in books of geology—indeed, the originals of some of the most remarkable of these pictures are assembled here—I could not help being astonished at the large size of some of them. The ichthyosaurus and plesiosaurus require cases extending along the whole side of a large room to contain them. What tremendous creatures they would have appeared to any one who saw them dabbling and swimming in their native seas; but we know that no human eye ever did see them in life, for the rocks above them show that they were extinct a vast period of time before man was created! The remains consist of bones only, and these are seen partly imbedded in slabs of the rock in which they have been found. I was scarcely less struck by the vast size of some head-bones of extinct quadrupeds, which are exhibited in this room.

We next proceeded to the series of rooms appropriated to the reception of Egyptian antiquities; and here a new world seemed to open up in the contemplation of objects in themselves curious, and rendered still more so by their excessive age. The first of this series of apartments is called the New Egyptian Room, which is a large and handsomely-finished saloon, lighted from the roof, and arranged in such a manner that the contents are seen to the utmost advantage.

The walls, as usual, are graced by glass cases, and the floor is occupied by a number of oblong cases of about four feet in height, six or seven in length, and perhaps three feet in width at the base, tapering gradually to one half the width at the top. These cases are entirely composed of glass, and contain mummies, or cases from which mummies have been taken, which are thus seen all round. In some of these there are divisions or shelves, so that one case sometimes contains three mummied figures placed horizontally. Two shades of larger dimensions than the rest, resembling in their form little glass houses, are occupied each by a single coffin, placed on a pivot; they can thus be made to revolve, so that the Egyptian characters by which these coffins are ornamented can be seen from any point. These gay receptacles of the dead are very large, being at least twice the depth of the coffins now in use; but then they were made to receive not only the body, which, with its swaddling-cloths, must have required a considerable deal of room, but they also held articles of various sorts, it being customary in ancient Egypt to entomb, along with the body, many of the articles with which the deceased had been surrounded while living. You will, I have no doubt, feel interested in learning, that in some baby coffins, the playthings of the little occupants have been found, showing that the care of an Egyptian mamma for the amusement or gratification of her children extended even beyond the grave, or at least beyond the period of life. These playthings consist of dolls, balls, and little moveable figures of animals, both of the human and the brute species, not unlike the toys of the present day. It is strange to see in a quiet street in London, objects that have formed the amusement of children three or four thousand years ago! And we may imagine, that in nursing and caressing these dolls, the youthful Egyptians exercised their faculty of philoprogenitiveness with the same zeal, and derived as much diversion from the exercise, as do the little mimic nurses of our own times.

Some of the things in this room are in admirable preservation; in one of the side cases on the left there is a *wig* found in a tomb at Thebes, which has all the appearance of having just come from the hands of the most skilful perruquier, whereas the exquisite for whom it was constructed has been amongst the things that *were* for a period of nearly four thousand years—possibly the occupant of one of those elaborately-ornamented coffins, bearing date as many centuries *before* the Christian era as have elapsed *since* that period. This Theban peruke is considerably larger than those now in use, excepting, perhaps, the wigs of barristers or judges. The upper part is in excellent curl, while from these curls depend long narrow braids, or plaits, which hang in bunches on each side.

The natural hankering of womankind after personal ornaments, draws us instinctively towards one of the cases containing necklaces, rings, brooches, and other articles of jewellery that have graced in their day the persons of some of the daughters of Egypt. The stones composing these trinkets are of various sizes and colours, some of them like beads, and others of a flat form linked together with gold. Many of the ornaments are in the form of animals, wrought either in gold, or carved out of precious stones; some of these have been perhaps used as talismans, and were most likely suspended from the neck. The *beetle* was held in great veneration by the Egyptians, from the circumstance of its being supposed to possess a superior degree of intelligence, and hence the cause of its being perpetuated in all imaginable sizes and ways. There are beetles of gold, of silver, and of stones of all colours, executed in the most spirited manner.

In this room are collected all descriptions of things used for domestic purposes in Egypt—articles of furniture, such as chairs, stools, and tables, besides ornaments, as vases, &c.; boxes for ointments and colours used by the Egyptian belles on their dressing-tables;

combs, pins, and mirrors—these latter articles are made, not of glass, but of polished metal, of a round form, and are not supported as are the mirrors of our day, but were held up by means of a handle, like the portable dressing-glasses now in use.

The rooms beyond this are called the Etruscan Rooms, from their containing specimens of the ancient pottery of Etruria in Italy, the Staffordshire of the days of antiquity. Amongst these vessels we find cups, bowls, jugs, vases, and pots used for baking. The ware is generally dark, brown and black being the principal colours of the *ground*, while the patterns are formed of gayer colours. Some jars are exceedingly elegant in shape, and not a few of them appear to have formed the models for articles now in use.

We now descend the stairs to the Egyptian Saloon, where the more bulky antiquities are to be seen; and as in the other apartments we were lost in amazement at the number of minute things which have survived the struggles of four thousand years, so here again is our wonder excited at the magnitude of some of the remains, which have not, however, escaped altogether uninjured. Several of the figures in this saloon are of carved stone, colossal in their proportions, yet preserving amazing gracefulness of outline. One of the busts, which was brought from Thebes by Belzoni in 1816, measures nearly nine feet in height, the face alone being upwards of three feet in length. Imagine the tremendous height of an entire figure of such proportions as this! But I cannot dwell on the various wonderful things in this room, neither can I afford space for more than the mere mention of the room adjoining, or of the grand Elgin Saloon beyond, which is to many persons the department of the most surpassing interest.
